

John R. Grindon, D.Sc.
Curriculum Vitae

Professional Summary

Dr. Grindon has more than 40 years of experience in the research, analysis, design and development of electronic systems, devices and software for acquiring, processing, analyzing, communicating and tracking signals and images. He is experienced in both hardware and software for these systems, including digital, analog and RF design. His doctoral research is in signal processing. He holds issued US and foreign patents in these areas.

He holds advanced degrees in Electrical Engineering from M.I.T. and from Washington University in St. Louis.

Summary of Areas of Expertise

- Digital Image and Video Acquisition, Processing and Analysis
- 3D Imaging
- Digital Signal Processing (DSP)
- Electronics and Electronic Systems
- Wireless Communications and Radar
- Navigation, Tracking and Position Location
- Pattern Matching and Classification
- RF Systems, Circuitry and Antennas
- Mathematical Modeling and Analytical Sciences

Education

<i>Year</i>	<i>University</i>	<i>Degree</i>
1970	Washington University in St. Louis	Doctor of Science (D.Sc.), Electrical Engineering.
1962	Massachusetts Institute of Technology	Master of Science (S.M.), Electrical Engineering
1961	University of Missouri at Rolla	Bachelor of Science (B.S.), Electrical Engineering

Continued Education:

- Continued education via credit and noncredit courses, workshops, seminars and self-study.

Professional Experience

From: 1990
To: Present
Organization: John R. Grindon & Associates
Title: Independent Consultant
Summary:

- Consultant to 3D3 Solutions of Vancouver, BC, for digital image processing software algorithm development for 3D measurement systems, including optical system calibration, position location and orientation. Consultant to Hoffman Patent Firm of Scottsdale, AZ, performing patent analyses and evaluations. Consultant to

John R. Grindon, D.Sc.
Curriculum Vitae

Beroe, Inc., of Chennai, India, on electronic sensors. Engineering consultant to Cyra Technologies, Inc., San Ramon, CA, a division of Leica Geosystems, for laser scanning, imaging and ranging systems to digitize 3D shapes of objects.

- Engineering consultant to [TC]² Corporation of Cary, NC, for development of an optical, electronic imaging system for digitizing the 3D shape of imaged objects. This system combines data from multiple, spatially-referenced digital video cameras. A patent was awarded for this work.

From: 1987

To: 1990

Organization: Cencit, Inc.

Title: Executive Vice President and Director of Research

- Summary:
- Created and led an engineering organization at Cencit, Inc., a startup company engaged in the research and development of three-dimensional electronic imaging systems based upon digital video image processing electronics and software algorithms.
 - Developed the concept and led the design and implementation of a three-dimensional computer vision system for non-contact shape digitization, and a computer-controlled four-axis DNC milling machine to replicate physical models of scanned objects. This equipment senses and digitizes the 360-degree surface of an object without physical contact by acquiring and processing digital video images taken by multiple cameras surrounding the object. The system then automatically controls the milling machine to produce a scaled three-dimensional replica from the digitized shape data. This work included development of calibration algorithms for determining internal camera parameters, for mutual alignment of the cameras, and for removal of lens distortion. U.S. and foreign Patents were awarded.

From: 1962

To: 1987

Organization: McDonnell Douglas Corporation

Title: Branch Chief - Electronics, and other positions

- Summary:
- Led project teams in digital image processing research and development for Cruise Missile guidance, correlation matching of sensed and stored reference images, and automatic target recognition.
 - Managed a software development and flight test program to develop mathematical models for statistically predicting tracking and guidance accuracy for the Tomahawk Cruise Missile using an on-board terrain-sensing radar and on-board stored digital terrain maps.
 - Led an engineering research and development team to develop scene analysis algorithms for three-dimensional (3-D) imagery for advanced autonomous Cruise Missile guidance employing imaging laser radars (LIDAR).
 - Conceived an approach and managed a project team to develop automatic target

John R. Grindon, D.Sc.
Curriculum Vitae

classification and recognition algorithms for anti-ship missiles using an on-board infrared imaging device, operating in the presence of noise, sea-clutter and countermeasures.

- Performed research and developed a new class of image processing algorithms for autonomous Cruise Missile location and guidance, using infrared (IR) imaging sensors to automatically recognize scenes based upon correlation of the sensed IR images with stored data models, employing an entropy algorithm.
- Invented a new system for detecting and accurately locating the positions of ground-based communications radio frequency (RF) transmitters through a method employing digital signal processing and methods of triangulation and statistical estimation. Similarly as GPS but with signal transmission in the reverse direction, this method accurately measures differences in signal arrival times and Doppler frequency shifts of signals received at multiple receivers aboard moving vehicles, which are used to determine the position location of the ground-based transmitter.
- Secured and led a series of research and development projects for the Department of Defense to analyze and develop systems including algorithms and electronics for locating the positions of ground-based communications radio frequency (RF) transmitters based upon signal time of arrival (TOA) technology.
- Developed a design methodology, computer aided engineering software, and RF hardware design for wide dynamic range, multi-octave, communications signal intercept receivers for defense applications. This receiver design methodology has particular application for use in systems employing time-of-arrival processing methods for position location and tracking wherein signal propagation delay must be preserved over a wide dynamic range and over a wide range of frequencies.
- Secured R&D grants, performed research and developed a new method to detect and locate covert spread-spectrum radio frequency signals, by correlating signals received at spaced antennas on the wings of an aircraft. These types of signals are used to hide radio communications beneath the noise and clutter of the frequency spectrum.
- Designed electronics for an onboard aircraft collision avoidance system, including the design of signal processing circuitry. This system, which was used to protect multiple fighter aircraft flying in the same airspace, transmits signals using time division multiple access (TDMA) in a coordinated fashion among the aircraft, measuring propagation times and Doppler frequency shifts. This information is processed on board to assess collision threats, warn the pilot, and indicate evasive maneuvers.
- Designed digital data communication modulator/demodulator (MODEM) for air-to-ground wireless communications using an efficient coding method.
- Developed digital RF frequency synthesizer for wireless communications receiver applications.
- Developed an electronic device for accurate measurement of relative velocities between aircraft by measuring the Doppler frequency shift of microwave signal pulses transmitted between aircraft in allocated time slots.

John R. Grindon, D.Sc.
Curriculum Vitae

- Designed a multi-path and clutter-tolerant omni-directional direction finding system for pulsed microwave signals employing a new type of multimode antenna (described below). Awarded a patent on this work.
- Performed pioneering research and co-designed a microwave direction finding antenna employing a waveguide cavity within which multiple electromagnetic field modes are generated by an arriving signal. Parameters of these electromagnetic modes depend upon the signal's direction of arrival. Upon receiving a signal pulse transmitted by an aircraft, these electromagnetic modes are sensed, electronically resolved and processed in real time to determine and display the position of the aircraft in range and azimuth.
- Performed research and received a patent on a new method of generating single-sideband signals for RF communications transmitters and frequency synthesizers, based upon combining RF signals that are differentially phase shifted in accordance with a modulating signal, thereby suppressing unwanted spectral products, or sidebands.
- Developed a new intermediate frequency (IF) amplifier design for pulsed-signal receivers for preserving radio frequency phase information over a wide dynamic range, for applications in phase-sensitive direction-finding and Doppler frequency shift measurement systems.
- Performed research and developed an electronic solution to the problem of mutual electromagnetic interaction, or unwanted coupling, among antennas on aircraft. The solution employs modeling the aircraft as an element in the RF electromagnetic system. Using this mathematical model, designed RF circuitry to decouple the antennas, thereby preventing mutual electromagnetic interference.

From: 1961
To: 1962
Organization: Massachusetts Institute of Technology Research Laboratory of Electronics (R.L.E.)
Title: Graduate Student
Summary: Designed microwave electronics for M.I.T.'s radio telescope.

From: 1961
To: 1961
Organization: Hughes Aircraft Corporation
Title: Engineer
Summary: Designed microwave electronics for field testing high-powered ground-based military radars.

From: 1960
To: 1960
Organization: Westinghouse Electric Corporation

**John R. Grindon, D.Sc.
Curriculum Vitae**

Title: Engineer
Summary: Designed RF electronics for military radar systems.

Litigation Support Experience

Matters in which Dr. Grindon has testified at trial, deposition or in a hearing, and matters in which he has prepared declarations and expert reports since 2008:

Expert Engagement:

Type of Matter: Patent *Inter Partes* Reviews
Law Firm: Fish & Richardson P.C.
Case Name: Apple, Inc., *Petitioner*, v. Ericsson, Inc., *Patent Owner*
Services Provided: Expert services on behalf of petitioner Apple. Prepared declarations.
Disposition: Open
Date: 2015 – Present

Expert Engagement:

Type of Matter: Patent *Inter Partes* Reviews
Law Firm: Fish & Richardson P.C.
Case Name: Google, Inc., *Petitioner*, v. Visual Real Estate, Inc., *Patent Owner*,
Cases IPR2014-01338; IPR2014-01339; IPR2014-01340; IPR2014-01341
Services Provided: Expert services on behalf of petitioner Google. Prepared declarations, deposed.
Disposition: Open
Date: 2015 – Present

Expert Engagement:

Type of Matter: Patent infringement and validity litigation
Law Firm: Finnegan, Henderson, Farabow, Garrett & Dunner, L.L.P., Washington DC
Case Name: Trover Group, Inc. v. Axis Communications, Inc. (Sweden); United States
District Court for the Eastern District of Texas, Marshall Division, Case No.
2:13-cv-1125-WCB,.
Services Provided: Expert services on behalf of defendant Axis Communications regarding patent
concerning security systems employing video imaging and image processing
hardware and software. Prepared expert report.
Disposition: Closed
Date: 2014 – 2015

Expert Engagement:

Type of Matter: Patent *Inter Partes* Reviews

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
