# Practitioner's Docket No. 915-005.48

PATENT

Preliminary Classification:

Proposed Class:

Subclass:

NOTE: "All applicants are requested to include a preliminary classification on newly filed patent applications. The preliminary classification, preferably class and subclass designations, should be identified in the upper right-hand corner of the letter of transmittal accompanying the application papers, for example 'Proposed Class 2, subclass 129.' " M.P.E.P. § 601, 7th ed.

## IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Box Patent Application Commissioner for Patents Washington, D.C. 20231

# NEW APPLICATION TRANSMITTAL

Transmitted herewith for filing is the patent application of

Inventor(s): KIMMO MYLLY

WARNING: 37 C.F.R. § 1.41(a)(1) points out:

"(a) A patent is applied for in the name or names of the actual inventor or inventors.

"(1) The inventorship of a nonprovisional application is that inventorship set forth in the oath or declaration as prescribed by § 1.63, except as provided for in § 1.53(d)(4) and § 1.63(d). If an oath or declaration as prescribed by § 1.63 is not filed during the pendency of a nonprovisional application, the inventorship is that inventorship set forth in the application papers filed pursuant to § 1.53(b), unless a petition under this paragraph accompanied by the fee set forth in § 1.17(i) is filed supplying or changing the name or names of the inventor or inventors."

For (title): A METHOD AND A SYSTEM FOR DETERMINING THE POWER CONSUMPTION IN CONNECTION WITH AN ELECTRONIC DEVICE, AND AN ELECTRONIC DEVICE

#### EXPRESS MAILING UNDER 37 C.F.R. § 1.10\* (Express Mail label number is mandatory.) (Express Mail certification is optional.)

I hereby certify that this paper, along with any document referred to, is being deposited with the United States Postal Service on this date <u>March 26, 2003</u>, in an envelope addressed to the Commissioner for Patents, Washington, D.C. 20231 as "Express Mail Post Office to Addressee" Mailing Label No. <u>EV137073922US</u>

Margery B. Hood

(type or print name of person mailing paper)

Signature of person certifying

WARNING: Certificate of mailing (first class) or facsimile transmission procedures of 37 C.F.R. 1.8 cannot be used to obtain a date of mailing or transmission for this correspondence.

\*WARNING: Each paper or fee filed by "Express Mail" must have the number of the "Express Mail" mailing label placed thereon prior to mailing. 37 C.F.R. 1.10(b). "Since the filing of correspondence under § 1.10 without the Express Mail mailing label thereon

"Since the filing of correspondence under § 1.10 without the Express Mail mailing label thereon is an oversight that can be avoided by the exercise of reasonable care, requests for waiver of this requirement will not be granted on petition." Notice of Oct. 24, 1996, 60 Fed. Reg. 56,439, at 56,442.

(New Application Transmittal [4-1]-page 1 of 15)

1. Type of Application

This new application is for a(n)

(check one applicable item below)

- I Original (nonprovisional)
- Design
  - Plant
- WARNING: Do not use this transmittal for a completion in the U.S. of an International Application under 35 U.S.C. § 371(c)(4), unless the International Application is being filed as a divisional, continuation or continuation-in-part application.

WARNING: Do not use this transmittal for the filing of a provisional application.

- NOTE: If one of the following 3 items apply, then complete and attach ADDED PAGES FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF A PRIOR U.S. APPLICATION CLAIMED and a NOTIFICATION IN PARENT APPLICATION OF THE FILING OF THIS CONTINUATION APPLICATION.
  - Divisional.
  - □ Continuation.
  - Continuation-in-part (C-I-P).

2. Benefit of Prior U.S. Application(s) (35 U.S.C. §§ 119(e), 120, or 121)

NOTE: "A nonprovisional application or international application designating the United States of America may claim an invention disclosed in one or more prior-filed copending nonprovisional applications or international applications designating the United States of America. In order for an application to claim the benefit of a prior-filed copending nonprovisional application or international application designating the United States of America, each prior-filed application must name as an inventor at least one inventor named in the later-filed application and disclose the named inventor's invention claimed in at least one claim of the later-filed application in the manner provided by the first paragraph of 35 U.S.C. 112. In addition, each prior-filed application must be:

(i) An international application entitled to a filing date in accordance with PCT Article 11 and designating the United States of America; or

(ii) Complete as set forth in § 1.51(b); or

(iii) Entitled to a filing date as set forth in § 1.53(b) or § 1.53(d) and include the basic filing fee set forth in § 1.16; or

(iv) Entitled to a filing date as set forth in § 1.53(b) and have paid therein the processing and retention fee set forth in § 1.21(l) within the time period set forth in § 1.53(f).

37 C.F.R. § 1.78(a)(1).

WARNING: If an application claims the benefit of the filing date of an earlier filed application under 35 U.S.C. §§ 120, 121 or 365(c), the 20-year term of that application will be based upon the filing date of the earliest U.S. application that the application makes reference to under 35 U.S.C. §§ 120, 121 or 365(c). (35 U.S.C. § 154(a)(2) does not take into account, for the determination of the patent term, any application on which priority is claimed under 35 U.S.C. §§ 119, 365(a) or 365(b).) For a c-i-p application, applicant should review whether any claim in the patent that will issue is supported by an earlier application and, if not, the applicant should consider canceling the reference to the earlier filed application. The term of a patent is not based on a claim-by-claim approach. See Notice of April 14, 1995, 60 Fed. Reg. 20,195, at 20,205.

(New Application Transmittal [4-1] page 2 of 15)

WARNING: 37 C.F.R. § 1.78(a)(2) deals with the time in which the claim for the benefit of an earlier filing date must be made and states:

"(2)(i) Except for a continued prosecution application filed under § 1.53(d), any nonprovisional application or international application designating the United States of America claiming the benefit of one or more prior-filed copending nonprovisional applications or international applications designating the United States of America applications designating the United States of America must contain or be amended to contain a reference to each such prior-filed application, identifying it by application number (consisting of the series code and serial number) or international application number and international filing date and indicating the relationship of the applications. Cross references to other related applications may be made when appropriate (see § 1.14).

(ii) This reference must be submitted during the pendency of the later-filed application. If the later-filed application is an application filed under 35 U.S.C. 111(a), this reference must also be submitted within the later of four months from the actual filing date of the later-filed application or sixteen months from the filing date of the prior-filed application. If the later-filed application after compliance with 35 U.S.C. 371, this reference must also be submitted within the later of four months from the national stage from an international application after compliance with 35 U.S.C. 371, this reference must also be submitted within the later of four months from the date on which the national stage commenced under 35 U.S.C. 371(b) or (f) in the later-filed international application or sixteen months from the filing date of the prior-filed application. These time periods are not extendable. Except as provided in paragraph (a)(3) of this section, the failure to timely submit the reference required by 35 U.S.C. 120 and paragraph (a)(2)(i) of this section is considered a waiver of any benefit under 35 U.S.C. 120, 121, or 365(c) to such prior-filed application. The time periods in this paragraph do not apply if the later-filed application is:

(A) An application for a design patent;

(B) An application filed under 35 U.S.C. 111(a) before November 29, 2000; or

(C) A nonprovisional application which entered the national stage after compliance with 35 U.S.C. 371 from an international application filed under 35 U.S.C. 363 before November 29, 2000.

(iii) If the later-filed application is a nonprovisional application, the reference required by this paragraph must be included in an application data sheet (§ 1.76), or the specification must contain or be amended to contain such reference in the first sentence following the title.

(iv) The request for a continued prosecution application under § 1.53(d) is the specific reference required by 35 U.S.C. 120 to the prior-filed application. The identification of an application by application number under this section is the identification of every application assigned that application number necessary for a specific reference required by 35 U.S.C. 120 to every such application assigned that application assigned that application assigned that application number."

- NOTE: If the new application being transmitted is a divisional, continuation or a continuation-in-part of a parent case, or where the parent case is an International Application which designated the U.S., or benefit of a prior provisional application is claimed, then check the following item and complete and attach ADDED PAGES FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF PRIOR U.S. APPLICA-TION(S) CLAIMED.
  - □ The new application being transmitted claims the benefit of prior U.S. application(s). Enclosed are ADDED PAGES FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF PRIOR U.S. APPLICATION(S) CLAIMED.
- 3. Papers Enclosed
  - A. Required for filing date under 37 C.F.R. § 1.53(b) (Regular) or 37 C.F.R. § 1.153 (Design) Application
    - <u>15</u> Pages of specification
    - <u>4</u> Pages of claims
    - \_4\_ Sheets of drawing
  - WARNING: DO NOT submit original drawings. A high quality copy of the drawings should be supplied when filing a patent application. The drawings that are submitted to the Office must be on strong, white, smooth, and non-shiny paper and meet the standards according to § 1.84. If corrections to the drawings are necessary, they should be made to the original drawing and a high-quality copy of the corrected original drawing then submitted to the Office. Only one copy is required or desired. For comments on proposed then-new 37 C.F.R. § 1.84, see Notice of March 9, 1988 (1990 O.G. 57-62).

(New Application Transmittal [4-1]-page 3 of 15)

NOTE: "Identification of drawings. Identifying indicia, if provided, should include the title of the invention, inventor's name and application number, or docket number (if any) if an application number has not been assigned to the application. If this information is provided, it must be placed on the front of each sheet and centered within the top margin."

#### (complete the following, if applicable)

The enclosed drawing(s) are photograph(s).

#### NOTE: 37 C.F.R. 1.84

#### "(b) Photographs.

"(1) Black and white. Photographs, including photocopies of photographs, are not ordinarily permitted in utility and design patent applications. The Office will accept photographs in utility and design patent applications, however, if photographs are the only practicable medium for illustrating the claimed invention. For example, photographs or photomicrographs of: electrophoresis gels, blots (e.g., immunological, western, Southern, and northern), auto radiographs, cell cultures (stained and unstained), histological tissue cross sections (stained and unstained), animals, plants, in vivo imaging, thin layer chromatography plates, crystalline structures, and, in a design patent application by a drawing, the examiner may require a drawing in place of the photograph. The photographs must be of sufficient quality so that all details in the photographs are reproducible in the printed patent.

"(2) Color photographs. Color photographs will be accepted in utility and design patent applications if the conditions for accepting color drawings and black and white photographs have been satisfied. See paragraphs (a)(2) and (b)(1) of this section."

# The enclosed drawing(s) are in color. Three (3) sets of color drawings and a "PETITION TO ACCEPT COLOR DRAWING(S)" are attached. 37 C.F.R. §§ 1.84(a)(2) and 1.84(b).

NOTE: 37 C.F.R. 1.84(a)

"(2) Color. On rare occasions, color drawings may be necessary as the only practical medium by which to disclose the subject matter sought to be patented in a utility or design patent application or the subject matter of a statutory invention registration. The color drawings must be of sufficient quality such that all details in the drawings are reproducible in black and white in the printed patent. Color drawings are not permitted in international applications (see PCT Rule 11.13), or in an application, or copy thereof, submitted under the Office electronic filing system. The Office will accept color drawings in utility or design patent applications and statutory invention registrations only after granting a petition filed under this paragraph explaining why the color drawings are necessary. Any such petition must include the following:

(i) The fee set forth in § 1.17(h);

(ii) Three (3) sets of color drawings;

(iii) A black and white photocopy that accurately depicts, to the extent possible, the subject matter shown in the color drawing; and

(iv) An amendment to the specification to insert (unless the specification contains or has been previously amended to contain) the following language as the first paragraph of the brief description of the drawings:

The patent or application file contains at least one drawing executed in color. Copies of this patent or patent application publication with color drawing(s) will be provided by the Office upon request and payment of the necessary fee."

  - Authorization of Attorney(s) to Accept and Follow Instructions from Representative
  - Special Comments
  - □ Other
- 5. Declaration or oath (including power of attorney)
- NOTE: A newly executed declaration is not required in a continuation or divisional application provided that the prior nonprovisional application contained a declaration as required, the application being filed is by all or fewer than all the inventors named in the prior application, there is no new matter in the application being filed, and a copy of the executed declaration filed in the prior application (showing the signature or an indication thereon that it was signed) is submitted. The copy must be accompanied by a statement requesting deletion of the names of person(s) who are not inventors of the application being filed. If the declaration in the prior application was filed under § 1.47, then a copy of that declaration must be filed accompanied by a copy of the decision granting § 1.47 status or, if a nonsigning person under § 1.47 has subsequently joined in a prior application, then a copy of the subsequently executed declaration must be filed. See 37 C.F.R. §§ 1.63(d)(1)–(3).
- NOTE: A declaration filed to complete an application must be executed, identify the specification to which it is directed, identify each inventor by full name including family name and at least one given name, without abbreviation together with any other given name or initial, and the residence, post office address and country or citizenship of each inventor, and state whether the inventor is a sole or joint inventor. 37 C.F.R. § 1.63(a)(1)–(4).
- NOTE: "The inventorship of a nonprovisional application is that inventorship set forth in the oath or declaration as prescribed by § 1.62, except as provided for in § 1.53(d)(4) and § 1.63(d). If an oath or declaration as prescribed by § 1.63 is not filed during the pendency of a nonprovisional application, the inventorship is that inventorship set forth in the application papers filed pursuant to § 1.53(b), unless a petition under this paragraph accompanied by the fee set forth in § 1.17(i) is filed supplying or changing the name or names of the inventor or inventors." 37 C.F.R. § 1.41(a)(1).

is (are) attached.

will follow.

NOTE: 37 C.F.R. § 1.55 Claim for foreign priority.

"(a) • • •

(1)(i) In an original application filed under 35 U.S.C. 111(a), the claim for priority must be presented during the pendency of the application, and within the later of four months from the actual filing date of the application or sixteen months from the filing date of the prior foreign application. This time period is not extendable. The claim must identify the foreign application for which priority is claimed, as well as any foreign application for the same subject matter and having a filing date before that of the application for which priority is claimed, by specifying the application number, country (or intellectual property authority), day, month, and year of its filing. The time periods in this paragraph do not apply in an application under 35 U.S.C. 111(a) if the application is:

(A) A design application; or

(B) An application filed before November 29, 2000.

. . . . .

(c) Unless such claim is accepted in accordance with the provisions of this paragraph, any claim for priority under 35 U.S.C. 119(a)-(d) or 365(a) not presented within the time period provided by paragraph (a) of this section is considered to have been waived. If a claim for priority under 35 U.S.C. 119(a)-(d) or 365(a) is presented after the time period provided by paragraph (a) of this section, the claim may be accepted if the claim identifying the prior foreign application by specifying its application number, country (or intellectual property authority), and the day, month, and year of its filing was unintentionally delayed. A petition to accept a delayed claim for priority under 35 U.S.C. 119(a)-(d) or 365(a) must be accompanied by:

(New Application Transmittal [4-1]-page 7 of 15)

(1) The claim under 35 U.S.C. 119(a)-(d) or 365(a) and this section to the prior foreign application, unless previously submitted;

(2) The surcharge set forth in § 1.17(t); and

(3) A statement that the entire delay between the date the claim was due under paragraph (a)(1) of this section and the date the claim was filed was unintentional. The Commissioner may require additional information where there is a question whether the delay was unintentional."

NOTE: 37 C.F.R. § 1.63 Oath or declaration.

"(a) An oath or declaration filed under § 1.51(b)(2) as a part of a nonprovisional application must:

(c) Unless such information is supplied on an application data sheet in accordance with § 1.76, the oath or declaration must also identify:

(2) Any foreign application for patent (or inventor's certificate) for which a claim for priority is made pursuant to § 1.55, and any foreign application having a filing date before that of the application on which priority is claimed, by specifying the application number, country, day, month, and year of its filing."

The foreign application forming the basis for the claim for priority must be referred to in the oath or declaration. 37 C.F.R. § 1.55(a) and 1.63.

NOTE: This item is for any foreign priority for which the application being filed directly relates. If any parent U.S. application or International Application from which this application claims benefit under 35 U.S.C. § 120 is itself entitled to priority from a prior foreign application, then complete item 18 on the ADDED PAGES FOR NEW APPLICATION TRANSMITTAL WHERE BENEFIT OF PRIOR U.S. APPLICATION(S) CLAIMED.

### 10. Fee Calculation (37 C.F.R. § 1.16)

A. 🖾 Regular application

		(	CLAIMS AS	FILED		
Number filed			Number Ex	tra	Rate	Basic Fee 37 C.F.R. § 1.16(a) x\$7x400x00 \$750.00
Total Claims (37 C.F.R. § 1.16(c))	26	- 20 =	6	×	\$ 18.00	108.00
Independent Claims (37 C.F.R. § 1.16(b))	4	- 3 =	1	×	\$ 84.00	84.00
Multiple dependen if any (37 C.F.R.	t clain § 1.16	n(s), B(d))		÷	\$280.00	

Amendment cancelling extra claims is enclosed.

Amendment deleting multiple-dependencies is enclosed.

Fee for extra claims is not being paid at this time.

NOTE: If the fees for extra claims are not paid on filing they must be paid or the claims cancelled by amendment, prior to the expiration of the time period set for response by the Patent and Trademark Office in any notice of fee deficiency. 37 C.F.R. § 1.16(d).

### 11. Assertion of Small Entity Status

□ Applicant hereby asserts status as a small entity under 37 C.F.R. § 1.27

NOTE: 37 C.F.R. § 1.27(c) deals with the assertion of small entity status, whether by a written specific declaration thereof or by payment as a small entity of the basic filing fee or the fee for the entry into the national phase and states:

"(c) Assertion of small entity status. Any party (person, small business concern or nonprofit organization) should make a determination, pursuant to paragraph (f) of this section, of entitlement to be accorded small entity status based on the definitions set forth in paragraph (a) of this section, and must, in order to establish small entity status for the purpose of paying small entity fees, actually make an assertion of entitlement to small entity status, in the manner set forth in paragraphs (c)(1) or (c)(3) of this section, in the application or patent in which such small entity fees are to be paid.

(1) Assertion by writing. Small entity status may be established by a written assertion of entitlement to small entity status. A written assertion must:

(i) Be clearly identifiable;

(ii) Be signed (see paragraph (c)(2) of this section); and

(iii) Convey the concept of entitlement to small entity status, such as by stating that applicant is a small entity, or that small entity status is entitled to be asserted for the application or patent. While no specific words or wording are required to assert small entity status, the intent to assert small entity status must be clearly indicated in order to comply with the assertion requirement.

(2) Parties who can sign and file the written assertion. The written assertion can be signed by:

(i) One of the parties identified in § 1.33(b) (e.g., an attorney or agent registered with the Office), § 3.73(b) of this chapter notwithstanding, who can also file the written assertion;

(ii) At least one of the individuals identified as an inventor (even though a 1.63 executed oath or declaration has not been submitted), notwithstanding 1.33(b)(4), who can also file the written assertion pursuant to the exception under 1.33(b) of this part; or

(iii) An assignee of an undivided part interest, notwithstanding §§ 1.33(b)(3) and 3.73(b) of this chapter, but the partial assignee cannot file the assertion without resort to a party identified under § 1.33(b) of this part.

(3) Assertion by payment of the small entity basic filing or basic national fee. The payment, by any party, of the exact amount of one of the small entity basic filing fees set forth in §§ 1.16(a), (f), (g), (h), or (k), or one of the small entity basic national fees set forth in §§ 1.492(a)(1), (a)(2), (a)(3), (a)(4), or (a)(5), will be treated as a written assertion of entitlement to small entity status even if the type of basic filing or basic national fee is inadvertently selected in error.

(i) If the Office accords small entity status based on payment of a small entity basic filing or basic national fee under paragraph (c)(3) of this section that is not applicable to that application, any balance of the small entity fee that is applicable to that application will be due along with the appropriate surcharge set forth in § 1.16(e), or § 1.16(l).

(ii) The payment of any small entity fee other than those set forth in paragraph (c)(3) of this section (whether in the exact fee amount or not) will not be treated as a written assertion of entitlement to small entity status and will not be sufficient to establish small entity status in an application or a patent."

(New Application Transmittal [4-1]-page 9 of 15)

WARNING: 37 C.F.R. § 1.27(c)(4): "Assertion required in related, continuing, and reissue applications. Status as a small entity must be specifically established by an assertion in each related, continuing and reissue application in which status is appropriate and desired. Status as a small entity in one application or patent does not affect the status of any other application or patent, regardless of the relationship of the applications or patents. The refiling of an application under § 1.53 as a continuation, divisional, or continuation-in-part application (including a continued prosecution application under § 1.53(d)), or the filing of a reissue application, requires a new assertion as to continued entitlement to small entity status for the continuing or reissue application."

WARNING: "Small entity status must not be established when the person or persons signing the . . . statement can unequivocally make the required self-certification." M.P.E.P., § 509.03 (emphasis added).

(complete the following, if applicable)

Status as a small entity was asserted in the prior application

/	, filed on	, from which benefit
is being claimed	for this application under:	
35 U.S.C. § 🗌       	119(e) 120 121 365(c)	

and which status as a small entity is still proper and asserted for this application.

- A copy of the written assertion of small entity filed in the prior application is included.
- NOTE: A refund based on establishment of small entity status, of a portion of fees timely paid in full prior to establishing status as a small entity may only be obtained if an assertion under § 1.27(c) and a request for a refund of the excess amount are filed within three months of the date of the timely payment of the full fee. The three-month time period is not extendable under § 1.136. 37 C.F.R. § 1.28(a).

## 15. Authorization to Charge Additional Fees

WARNING: If no fees are to be paid on filing, the following items should not be completed.

- WARNING: Accurately count claims, especially multiple dependent claims, to avoid unexpected high charges, if extra claim charges are authorized.
- WARNING: Even though small entity status is accorded where the wrong type of small entity basic filing fee or basic national fee is selected but the exact amount of the fee is paid, applicant still needs to pay the correct small entity amount for the basic filing or basic national fee where selection of the wrong type of fee results in a deficiency. While an accompanying general authorization to charge any additional fees suffices to pay the balance due of the proper small entity basic filing or basic national fee, specific authorizations to charge fees under § 1.17 or extension of time fees do not suffice to pay any balance due of the proper small entity basic filing or basic they do not actually authorize payment of small entity amounts. Changes To Implement the Patent Business Goals; Final Rule [Fed. Reg.: September 8, 2000, pages 54603-54683, at 54611; OG: October 3, 2000, pages 14-39].
  - The Office is hereby authorized to charge, in the manner shown above, the following additional fees that may be required by this paper and during the entire pendency of this application.
    - 37 C.F.R. § 1.16(a), (f) or (g) (filing fees)
    - □ 37 C.F.R. § 1.16(b), (c) and (d) (presentation of extra claims)
- NOTE: Because additional fees for excess or multiple dependent claims not paid on filing or on later presentation must only be paid or these claims cancelled by amendment prior to the expiration of the time period set for response by the PTO in any notice of fee deficiency (37 C.F.R. § 1.16(d)), it might be best not to authorize the PTO to charge additional claim fees, except possibly when dealing with amendments after final action.
  - □ 37 C.F.R. § 1.16(e) (surcharge for filing the basic filing fee and/or declaration on a date later than the filing date of the application)
  - □ 37 C.F.R. § 1.17(a)(1)-(5) (extension fees pursuant to § 1.136(a)).
  - ☐ 37 C.F.R. § 1.17 (application processing fees)
- NOTE: ". . A written request may be submitted in an application that is an authorization to treat any concurrent or future reply, requiring a petition for an extension of time under this paragraph for its timely submission, as incorporating a petition for extension of time for the appropriate length of time. An authorization to charge all required fees, fees under § 1.17, or all required extension of time fees will be treated as a constructive petition for an extension of time in any concurrent or future reply requiring a petition for an extension of time under this paragraph for its timely submission. Submission of the fee set forth in § 1.17(a) will also be treated as a constructive petition for an extension of time in any concurrent reply requiring a petition for an extension of time under this paragraph for its timely submission." 37 C.F.R. § 1.136(a)(3).
  - □ 37 C.F.R. § 1.18 (issue fee at or before mailing of Notice of Allowance, pursuant to 37 C.F.R. § 1.311(b))
- NOTE: Section 1.311(b) provides that an authorization to charge the issue fee (§ 1.18) to a deposit account may be filed in an individual application only after the mailing of the notice of allowance. Accordingly, general authorizations to pay fees and specific authorizations to pay the issue fee that are filed prior to the mailing of a notice of allowance will generally not be treated as requesting payment of the issue fee and will not be given effect to act as a reply to the notice of allowance. Applicant, when paying the issue fee, should submit a new authorization to charge fees, such as by completing box 6b on the current PTOL-85B form. Where no reply to the notice of allowance is received, the application will stand abandoned notwithstanding the presence of general authorizations to pay fees or a specific authorization to pay the issue fee that were submitted prior to mailing of the notice of allowance. Where an attempt is made to pay the issue fee but an incorrect amount is submitted, § 1.311(b)(1), or where the Office's issue fee transmittal form (currently PTOL-85(B)) is completed by applicant and submitted, § 1.311(b)(2), in reply to a notice of allowance, an exception will be made. Such submissions will operate as a request to charge the issue fee to any deposit account identified in a previously filed (i.e., submitted prior to the mailing of the notice of allowance) authorization to charge fees, and will be allowed to act as payment of the correct issue fee. § 1.311(b). See also the change to § 1.26(b). Notice of September 8, 2000, Fed. Reg. 54603-54683, at 54646 and 54647.

(New Application Transmittal [4-1]-page 12 of 15)

NOTE: 37 C.F.R. § 1.28(b) requires "Notification of any change in status resulting in loss of entitlement to small entity status must be filed in the application . . . prior to paying, or at the time of paying, . . . the issue fee. . . " From the wording of 37 C.F.R. § 1.28(b), (a) notification of change of status must be made even if the fee is paid as "other than a small entity" and (b) no notification is required if the change is to another small entity.

### 16. Instructions as to Overpayment

NOTE: "... Amounts of twenty-five dollars or less will not be returned unless specifically requested within a reasonable time, nor will the payer be notified of such amounts; amounts over twenty-five dollars may be returned by check or, if requested, by credit to a deposit account." 37 C.F.R. § 1.26(a).

Re Application of

Kimmo Mylly

Filed: Herewith

For: A METHOD AND A SYSTEM FOR DETERMINING THE POWER CONSUMPTION IN CONNECTION WITH AN ELECTRONIC DEVICE, AND AN ELECTRONIC DEVICE

## PRELIMINARY AMENDMENT A

Assistant Commissioner for Patents U.S. Patent and Trademark Office Washington, D.C. 20231

Sir:

Please preliminarily amend the above-referenced application as follows:

FILING OF PAPERS AND FEES BY "EXPRESS MAIL" WITH CERTIFICATE IN ACCORDANCE WITH 37 CFR 1.10

I hereby certify that this correspondence is being deposited with the United States Postal Service on the date shown below with sufficient postage as "Express Mail" in an envelope with Mailing Label No. EVI37073922US placed thereon prior to mailing and addressed to the U.S. Patent and Trademark Office, P.O. Box 2327, Arlington, VA 2202.

Arlington, VA 22202.  $\mathcal{U}$ Margery B. Hood 26, 2003 Dated: 71

### IN THE SPECIFICATION:

The paragraph beginning at page 3, line 6 has been amended as follows:

--In said MultiMediaCard Association, a maximum limit has been proposed for the power consumption of memory cards of the MultiMediaCard<sup>™</sup> type. Thus, in electronic devices supporting this standard, the provision is made to supply a defined maximum power to the peripheral device. Moreover, the power consumption of memory cards of the MultiMediaCard<sup>™</sup> type should thus not exceed the defined maximum limit. Such an arrangement is difficult, for example, for the reason that the power consumption of new memory cards to be developed is limited to this maximum value, wherein it may be an impediment for the implementation of such memory cards whose power consumption cannot be made smaller than the selected maximum limit. If the maximum limit is set so high that the power consumption of other memory cards to be developed later on is also very likely to be smaller than this, it will mean that relatively efficient and large regulators must be used in electronic devices, perhaps unnecessarily .--

The paragraph beginning at page 5, line 29 has been amended as follows:

--Fig. 1 shows the system according to a preferred embodiment of the invention in a reduced block chart simplified block diagram,--

The paragraph beginning at page 5, line 32 has been amended as follows:

--Fig. 2 shows a system according to a second preferred embodiment of the invention in a reduced manner simplified block diagram,--

The paragraph beginning at page 5, line 35 has been amended as follows:

--Fig. 3 shows signalling in the method according to a preferred embodiment of the invention in a reduced simplified manner, and--

The paragraph beginning at page 6, line 1 has been amended as follows:

--Fig. 4 shows a peripheral device according to yet another preferred embodiment of the invention in a <del>reduced block</del> <del>chart</del> simplified block diagram.--

The paragraph beginning at page 6, line 7 has been amended as follows:

--In the system according to an advantageous embodiment of the invention, shown in Fig. 1, the electronic device 1 is exemplified by a wireless communication device. In this example, the peripheral device 2 is a memory card, such as a memory card complying with the MultiMediaCard<sup>™</sup> standard. However, it will be obvious evident that the present invention is not limited solely to such electronic devices and peripheral devices, but the invention can also be applied in connection with other electronic devices and peripheral devices. The peripheral device 2 can be, for example, an interface card or also another device. The electronic device 1 contains a control block 3 comprising one or more processors, such as a micro controller unit (MCU). Furthermore, the electronic device 1 comprises a memory 4, a user interface 5 and means 6 for performing mobile station functions, such as GSM and/or UMTS mobile communication means. The user interface 5 preferably comprises a display, a keypad and audio means in a way known as such. For the connection of the peripheral device 2, the electronic device 1 is provided with connecting means 7 which

comprise at least one connector 8 as well as the necessary I/O blocks 9, for example to connect the buses of the peripheral device 2 and the electronic device 1 to each other.--

The paragraph beginning at page 6, line 28 and ending at page 7, line 4 has been amended as follows: --The peripheral device is also provided with corresponding connecting means 10 for connecting the peripheral device 2 to the electronic device 1. The connecting means 10 of the peripheral device comprise at least one connector 11 which can be connected to the connector 8 of the electronic device 1, and an I/Oblock 12. The power supply to the peripheral device 2 is arranged from the electronic device 1 via the connectors 8, 11. The I/O blocks are used for communication between the electronic device 1 and the peripheral device 2. This can take place as parallel data transmission or serial data transmission. For example, said peripheral device according to the MultiMediaCard<sup>™</sup> specifications applies serial data transmission. However, in view of the present invention, it is not significant, in which format is used for the data transmission between the electronic device 1 and the peripheral device 2 is carried out not significant.--

The paragraph beginning at page 7, line 20 and ending at page 8, line 12 has been amended as follows: --The following is a description of the operation of the method according to a preferred embodiment of the invention in a system shown in Fig. 1. For example, information on whether a peripheral device 2 is placed in the connector 8 of the connecting means of the electronic device, is transmitted via the I/O blocks to the electronic device 1. This can be implemented, for example, by providing the I/O block 9, 12 with a detection line 15 whose state is changed when the peripheral device 2 is placed in the

connector 8. In this advantageous embodiment of the invention, the detection line 15 is implemented so that the detection line 15 is set in the logical 1 state by means of a pull-up resistance R in the electronic device 1. In the system of Fig. 1, the change of state is achieved in such a way that the peripheral device 2 <del>earths</del> grounds the detection line 15, wherein the state of the detection line 15 is changed to the logical 0 state. This change of state is detected in the electronic device 1, for example, in such a way that the change of state causes an interrupt in the control block 3, wherein a corresponding interrupt service program is run and the running of the initializing functions of the peripheral device are started. After the operating voltages have been coupled to the peripheral device, the processor 13 of the peripheral device 2 will start to run its own initializing operations. For example, the power consumption of the peripheral device 2 is set to a default value which, in this advantageous embodiment, is a power consumption value according to the first maximum limit. In this context, it is assumed that the first maximum limit is lower than the second maximum limit. The processor also sets the frequency of the clock generator 16 to correspond to this power consumption value. Typically, the frequency of the clock generator is set to a minimum value. In all peripheral devices 2, it is not necessarily possible to control the frequency of the clock generator 16, wherein the clock generator 16 cannot be used for controlling the power consumption .--

The paragraph beginning at page 8, line 14 and ending at page 9, line 3 has been amended as follows: --In the operations of initializing the peripheral device, performed by the electronic device 1, the type of the peripheral device 2 is preferably examined, which may affect the type of

initialization operations to be performed. However, this description will only discuss the operations which are essential in view of the invention. The signalling to be performed in this method according to the advantageous embodiment of the invention is illustrated in a reduced simplified manner in the appended Fig. 3. The determination of the type of the peripheral device 2 will be followed by determining the first and second maximum limits for power consumption which have been stored on the device 2, such as a card. Thus, a maximum limit reading message is preferably transmitted from the electronic device 1 to the peripheral device 2. This is illustrated by arrow a signal on a line 301 in the chart of Fig. 3. The message is received in the peripheral device 2 and its content is preferably examined in  $\frac{1}{2}$ the processor 13. On the basis of the message, the processor 13 reads the first maximum limit and the second maximum limit from the memory 14 (block 302 in Fig. 3). If there are more than two maximum limits, the number of the maximum limits is preferably stored in the memory means, wherein the processor 13 reads the values of all the maximum limits from the memory 14. After this, the processor 13 generates a reply message (block 303) containing the requested information, such as the first and second maximum limits and, if necessary, also the number of the maximum limits. In the case of several maximum limits, also the values of the other maximum limits are preferably included in the message. The message is transmitted via the I/O blocks 9, 12 to the electronic device (arrow as indicated by a signal on a line 304), in which the control block reads the information of the received message and, if necessary, stores them the information in the memory 4 of the electronic device .--

The paragraph beginning at page 9, line 5 has been amended as follows:

--After the maximum limits of power consumption supported by the peripheral device are known in the electronic device 1, it is possible to start to adjust the power consumption of the peripheral device, if necessary. Let us assume that the electronic device 1 is capable of supplying the power corresponding to the second maximum limit to the peripheral device 2. Thus, a power control message is transmitted from the electronic device 1 to the peripheral device 2 (arrow as indicated by a signal on a line 305). This power control message indicates the power consumption value which is to be set as the maximum value for the peripheral device 2, for example said second maximum limit. The processor 13 of the peripheral device examines the type of the received message, and after determining that it is a power control message, reads the maximum value for power consumption indicated in the message (block 306). Next, the processor 13 of the peripheral device sets, for example the operating frequency of the clock generator 16 to a value corresponding to this maximum value for power consumption, for example to the highest possible frequency. In some embodiments, the bus widths within the processor can also be changed according to the maximum limit used for power consumption. Furthermore, the peripheral device 2 preferably informs the electronic device 1 that the power consumption has been limited to the requested value (arrow as indicated by a signal on a line 307).--

The paragraph beginning at page 9, line 27 and ending at page 10, line 16 has been amended as follows: --If the electronic device 1 cannot supply the peripheral device 2 with the power of the second maximum limit, or if, for another reason, the electronic device 1 tends to set the maximum value for power consumption lower than the second maximum limit, it is possible to perform signalling, by which the electronic

device 1 and the peripheral device try to find such a maximum limit for power consumption which is suitable in the situation. This can be carried out, for example, in such a way that the electronic device 1 selects, between the first and second maximum limits, a value which is a maximum value in from the point of view of the electronic device 1. Information about this limit is transferred to the peripheral device 2, in which the suggested value is examined in the processor 13, and if it is found acceptable, this information is transferred to the electronic device 1. If the peripheral device 2 cannot set its own power consumption to such a level which corresponds to the suggested maximum value, the peripheral device 2 will suggest a lower value between the first and second maximum values. If this value is possible in from the point of view of the electronic device 1, the electronic device 1 will transmit this information to the peripheral device 2, in which the power consumption is set to this value. If the value suggested by the peripheral device 2 is not suitable, the electronic device 1 advantageously selects another, preferably lower value which, however, is at least equal to the first maximum limit, and reports it to the peripheral device 2. The above-presented steps are iterated, until such a power consumption value is found which is suitable for both the electronic device 1 and the peripheral device 2. In some cases, it may occur that the only suitable value is the first maximum value, wherein the power consumption does not need to be adjusted, because this value is the default value.--

The paragraph beginning at page 10, line 18 has been amended as follows:

--There may also be a need to change the value of the power consumption during the operation of the electronic device 1 and the peripheral device 2 connected to the same together. For

example, if the peripheral device is a transceiver card, such as a mobile station card or a modem card, there may be a need to significantly change the power consumption limit of the peripheral device 2, for example, for the time of a transmission. Thus, at the stage when *e.g.* the peripheral device 2 detects a need to change the power consumption, it transmits a message to the electronic device 1 and proposes a new power consumption value which is, however, in the range between the first and second maximum values. An exchange of messages is performed between the electronic device 1 and the peripheral device 2 by applying the above-described principles, to control the power consumption of the peripheral device according to the need. When the need for power consumption is changed again, a new adjustment of the power consumption can be made.--

The paragraph beginning at page 12, line 7 has been amended as follows:

--Consequently, the power consumption of the peripheral device 2 can be adjusted *e.g.* by changing the clock frequency and/or the bus width, but it is obvious should be evident that other methods for adjusting the power consumption are also known and are applicable in connection with the invention. The power Power consumption can also be controlled by controlling the operating voltage, if the operating voltage of the peripheral device 2 does not need to be a given constant value. Peripheral devices are known, in which the operating voltage can be selected to be, for example, either 3 V, 3.3 V, or 5 V. Yet another example to be mentioned in this context of the possibilities to control the power consumption of the peripheral device is to control the current consumption of the peripheral device.--

The paragraph beginning at page 12, line 20 has been amended

as follows:

--Further, the power consumption of the peripheral device 2 can also be adjusted by changing the clock frequency of the bus of the connection between the peripheral device and the electronic device, if it is independently adjustable. The clock frequency of the bus can be changed e.g. by the electronic device 1 and/or by the peripheral device 2, if necessary. The electronic device 1 controls a clock generator(s) (not shown) which produces the timing signals for the bus according to the same principles than what as was presented above.--

The paragraph beginning at page 15, line 4 has been amended as follows:

--It will be obvious evident to those of skill in the art that the steps to be taken in the setting of the power consumption can also be implemented in another way than the above-presented handshake in the form of messages. For example, the connection means 7, 10 can be provided with connection lines which are used to set the power consumption of the peripheral device. Furthermore, the invention can be applied in such a way that certain alternative (allowable) values are defined for said maximum limits, wherein the first maximum limit and the second maximum limit for each peripheral device is selected from the set of these alternative limits.--

The paragraph beginning at page 15, line 32 has been amended as follows:

--It is obvious should be evident that the present invention is not limited solely to the above-presented embodiments but it can be modified within the scope of the appended claims.--

#### IN THE CLAIMS:

1. (Amended) A method for determining the power consumption in an electronic device, to which a peripheral device is connected, to which the power is supplied from the electronic device, wherein wherein the method comprising determining, for the power consumption, at least a first maximum value and a second maximum value which is higher than the first maximum value, and performing, between the electronic device and the peripheral device, setting of the a maximum for the power consumption of the peripheral device to a value which is between said first and second maximum values.

2. (Amended) The method according to claim 1, wherein wherein said first maximum limit value is used as a default value for the power consumption, wherein the power consumption of the peripheral device is set, at the a startup stage, to be substantially not higher than said first maximum limit.

3. (Amended) The method according to claim 1, wherein wherein said second maximum limit value is used as the a highest allowable limit value for the power consumption.

4. (Amended) The method according to claim 1, wherein wherein messages are transferred between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum limit value and said second maximum limit value.

5. (Amended) The method according to claim 1, wherein wherein at least one content is stored in the peripheral device, to be used for use in connection with the electronic device, wherein at the a stage of storing the content, the power consumption set for

the peripheral device is a value corresponding to said second maximum <del>limit</del> value, and at the a stage of using the content, the power consumption set for the peripheral device is a value corresponding to said first maximum <del>limit</del> value.

6. (Amended) The method according to the claim 1, wherein wherein at least one clock signal is generated in the peripheral device and that wherein the power consumption of the peripheral device is controlled by adjusting the frequency of at least one clock signal.

7. (Amended) The method according to the claim 1, wherein wherein the peripheral device comprises at least one bus and that the power consumption of the peripheral device is controlled by controlling the a width of said bus width of the peripheral device.

8. (Amended) The method according to the claim 1, wherein wherein the peripheral device is provided with two or more storage blocks (2) is controlled by controlling the a number of storage blocksprocessed blocks processed by the peripheral device substantially simultaneously.

9. (Amended) A system comprising an electronic device with means for connecting a peripheral device and means for supplying power to the peripheral device, and which system comprises means for determining the power consumption, wherein wherein at least a first maximum value and a second maximum value which is higher than the first maximum value are defined for the power consumption, and that wherein the means for determining the power consumption comprise means for setting the a maximum of the power consumption of the peripheral device to a value which is between

said first maximum value and second maximum value.

10. (Amended) The system according to claim 9, comprising means for transferring messages between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum limit value and said second maximum limit value.

11. (Amended) The system according to claim 9, wherein wherein the peripheral device comprises means for generating at least one clock signal, and that wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting the frequency of said at least one clock signal.

12. (Amended) The system according to claim 9, wherein wherein the peripheral device comprises at least one bus, and that wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting the bus width of the peripheral device.

13. (Amended) The method according to the claim 9, wherein wherein the peripheral device is provided with two or more storage blocks, and that wherein the means for controlling the power consumption of the peripheral device comprise means for adjusting the a number of storage blocks processed by the peripheral device substantially simultaneously.

14. (Amended) The system according to the claim 9, wherein wherein the electronic device is a portable electronic device .

15. (Original) The system according to claim 14, comprising means for performing mobile station functions.

16. (Amended) An electronic device provided with means for connecting a peripheral device and means for supplying power to the peripheral device, and means for determining the power consumption, wherein wherein at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that wherein the means for determining the power consumption comprise means for setting the a maximum of the power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value.

17. (Amended) The electronic device according to claim 16, comprising means for transmitting messages from to the peripheral device and for receiving messages from the peripheral device, to set the power consumption of the peripheral device to a value substantially between said first maximum limit and said second maximum limit.

18. (Amended) The electronic device according to claim 16, wherein it is a portable electronic device.

19. (Original) The electronic device according to claim 18, comprising means for performing mobile station functions.

20. (Amended) A peripheral device provided with means for connecting the peripheral device to an electronic device, from which the for supplying power required for using the peripheral device is arranged to be supplied to the peripheral device, wherein wherein at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that wherein the peripheral device comprises means for setting the a maximum of

the power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value.

21. (Amended) The peripheral device according to claim 20, wherein wherein at least one content is stored in the peripheral device to be used for use in connection with the electronic device.

22. (Amended) The peripheral device according to claim 20, comprising means for generating at least one clock signal and means for controlling the power consumption of the peripheral device by controlling the frequency frequency control of said at least one clock signal.

23. (Amended) The peripheral device according to claim 20, comprising at least one bus and means for controlling the power consumption of the peripheral device by controlling the a bus width of said bus of the peripheral device.

24. (Amended) The peripheral device according to the claim 20, wherein wherein the peripheral device is provided with two or more storage blocks, and that the means for controlling the power consumption of the peripheral device comprise means for controlling the a number of storage blocks processed by the peripheral device substantially simultaneously.

25. (Amended) The peripheral device according to the claim 20, wherein wherein said first maximum value and said second maximum value are stored in the peripheral device.

26. (Amended) The peripheral device according to the claim 20, wherein it wherein said peripheral device is a MultiMediaCard<sup>™</sup> peripheral device.

# IN THE ABSTRACT:

# --Abstract of the Disclosure

The present invention relates to a method and a system for determining the power consumption in an electronic device, to which a peripheral device is connected, to which the power is supplied from the electronic device. At least a first maximum value and a second maximum value, higher than the first maximum value, are determined for the power consumption. Between Signaling between the electronic device and the peripheral device, sets a maximum value for the power consumption of the peripheral device is set to a value which is between said first and second maximum values. The invention also relates to an electronic device and a peripheral device, in which the method is applied.

1

A method and a system for determining the power consumption in connection with an electronic device, and an electronic device

# 5 Cross-Reference to Related Applications

This application claims priority under 35 USC §119 to Finnish Patent Application No. 20020594 filed on March 27, 2002.

# 10 Field of the Invention

.

The present invention relates to a method for determining the power consumption in an electronic device, to which a peripheral device is connected, which is supplied with power from the electronic device.

- 15 The invention also relates to a system which comprises an electronic device provided with means for connecting a peripheral device and means for supplying power to the peripheral device, and which system comprises means for determining the power consumption. Furthermore, the invention relates to an electronic device provided with means
- for connecting a peripheral device, means for supplying power to the peripheral device, and means for determining the power consumption of the peripheral device. Moreover, the invention relates to a peripheral device provided with means for connecting the peripheral device to an electronic device, from which the power needed for using the peripheral device.

# Background of the Invention

At present, several such electronic devices are in use, to which it is 30 possible to connect various peripheral devices, *e.g.* to expand the properties of the electronic device and to produce auxiliary functions. For example, it is possible to connect peripheral devices, such as connection cards (*e.g.* PCMCIA cards), to laptop computers to connect the laptop computer to a local area network, a landline or wireless telephone network, *etc.* Furthermore, peripheral devices can be used to expand the memory of the laptop computer, to connect an external fixed disk, a CDROM station, or the like. 2

The MultiMediaCard<sup>™</sup> Association is, among other things, developing a standard for memory expansion boards (MultiMediaCard<sup>™</sup>; Multi-MediaCard<sup>™</sup> is a trademark of Infineon Technologies AG). These memory expansion boards can be used in various portable electronic devices, such as wireless communication devices and communicator type devices, to expand the memory capacity.

5

Because the peripheral devices can be connected to a variety of devices, the power consumption of the peripheral device should not exceed the maximum power that can be supplied from the electronic device to the peripheral device. Otherwise, the operation of the peripheral device and/or the electronic device may be disturbed and the electronic device may even be overheated. On the other hand, the power consumption requirements of different peripheral devices may be very different, wherein manufacturers of electronic devices should

- provide for the maximum power consumption in the power supply of the peripheral device connection. Solutions are known, such as Nokia Communicator 9110/9210, in which the power supply of the peripheral device connection of the electronic device is provided with a relatively
- efficient regulator, for example in the order of 150 mA/3 V. Such an efficient regulator is a relatively bulky component, which may cause placement problems, particularly in portable electronic devices. The provision for the maximum power consumption will be unnecessary in
- such electronic devices, whose users do not use, in connection with the electronic device, such a peripheral device whose power consumption is close to the maximum power consumption of the peripheral device designed for the electronic device. On the other hand, another user of a similar electronic device may use such a peripheral device
- 30 whose power consumption is in the order of the maximum power consumption of the peripheral device designed for the electronic device.

In some electronic devices and peripheral devices to be connected to them, the operating voltage is selected at the stage when the periph-35 eral device is turned on, *e.g.* when the electronic device is turned on or when the peripheral device is connected. Thus, signalling will be performed between the electronic device and the peripheral device, for the electronic device to determine the level of the operating voltage required by the peripheral device and to select an operating voltage suitable for the peripheral device to the operating voltage line(s) of the peripheral device.

5

10

15

<u>,</u>

In said MultiMediaCard Association, a maximum limit has been proposed for the power consumption of memory cards of the MultiMedia-Card<sup>™</sup> type. Thus, in electronic devices supporting this standard, the provision is made to supply a defined maximum power to the peripheral device. Moreover, the power consumption of memory cards of the MultiMediaCard<sup>™</sup> type should thus not exceed the defined maximum limit. Such an arrangement is difficult, for example, for the reason that the power consumption of new memory cards to be developed is limited to this maximum value, wherein it may be an impediment for the implementation of such memory cards whose power consumption cannot be made smaller than the selected maximum limit. If the maximum limit is set so high that the power consumption of other memory cards to be developed later on is also very likely to be smaller than this, it will mean that relatively efficient and large regulators must be used in

20 electronic devices.

The power consumption of the peripheral device is normally proportional to the clock frequency used in the peripheral device, wherein an increase in the clock frequency will increase the power consumption. In a corresponding manner, to decrease the power consumption, the clock frequency of the peripheral device can be decreased, if this is possible in view of the other functions of the peripheral device. However, the operating rate of the peripheral device will thus decrease, which is not necessarily desirable. Also, the bus width used in the peripheral device has an effect on how much power is consumed in the peripheral device.

# Summary of the Invention

35 It is an aim of the present invention to provide an improved method and system for determining the power consumption to be suitable in each situation. It is another aim of the invention to provide an electronic 4

device and a peripheral device for applying the method. The invention is based on the idea of determining at least a first and a second maximum value for the power consumption, wherein the electronic device and the peripheral device set the power consumption to a value between these first and second maximum values. Thus, in different operating situations, for example the peripheral device can adjust its power consumption to be suitable for the situation. The method according to the present invention is primarily characterized in determining, for the power consumption, at least a first maximum value and a second maximum value which is higher than the first maximum value, and setting, between the electronic device and the peripheral device, the maximum for the power consumption of the peripheral device to a value which is substantially between said first and second maximum values. The system according to the invention is primarily character-

15 ized in that at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that the means for determining the power consumption comprise means for setting the maximum for the power consumption of the peripheral device to a value which is between said

- first maximum value and said second maximum value. The electronic device according to the invention is primarily characterized in that at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that the means for determining the power consumption
- 25 comprise means for setting the maximum for the power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value. Furthermore, the peripheral device according to the invention is primarily characterized in that at least a first maximum value and a second maximum value which is
- 30 higher than the first maximum value, are defined for the power consumption, and that the means for determining the power consumption comprise means for setting the maximum for the power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value.

35

5

10

The present invention shows remarkable advantages over solutions of prior art. By the method according to the invention, it is possible to
avoid the use of an unnecessarily large regulator in an electronic device, which saves costs, and wherein the size of the electronic device can, in some cases, be reduced and, on the other hand, problems of heating caused by high power consumption can be avoided. Also the power consumption can be reduced, which is advantageous particularly in portable devices. By means of the invention, the peripheral device connection can also be provided with flexibility, because the

power consumption of the peripheral device can be adjusted and set to

- a value suitable for each situation of use. Also, the clock frequency and bus width of the peripheral device can be changed in the system according to an advantageous embodiment of the invention. Furthermore, the invention makes it possible that new peripheral devices to be developed will function in connection with electronic devices made earlier, and existing peripheral devices will function in connection with new
- 15 electronic devices to be developed. With the solution according to the invention, it is also possible to achieve an improvement in the user-friendliness of the electronic device, for example, in a situation in which the peripheral device cannot fully operate on a lower level of power consumption but it can, however, inform the electronic device about
- 20 this. Thus, the electronic device can take care of the shutdown (turning off) of the peripheral device in the appropriate way and notify the user of this.

# Brief Description of the Drawings

25

30

5

In the following, the invention will be described in more detail with reference to the appended drawings, in which

- Fig. 1 shows the system according to a preferred embodiment of the invention in a reduced block chart,
  - Fig. 2 shows a system according to a second preferred embodiment of the invention in a reduced manner,
- 35 Fig. 3 shows signalling in the method according to a preferred embodiment of the invention in a reduced manner, and

Fig. 4 shows a peripheral device according to yet another preferred embodiment of the invention in a reduced block chart.

## 5 Detailed Description of the Invention

In the system according to an advantageous embodiment of the invention, shown in Fig. 1, the electronic device 1 is exemplified by a wireless communication device. In this example, the peripheral device 2 is a memory card, such as a memory card complying with the Multi-10 MediaCard<sup>™</sup> standard. However, it will be obvious that the present invention is not limited solely to such electronic devices and peripheral devices, but the invention can also be applied in connection with other electronic devices and peripheral devices. The peripheral device 2 can be, for example, an interface card or also another device. The elec-15 tronic device 1 contains a control block 3 comprising one or more processors, such as a micro controller unit (MCU). Furthermore, the electronic device 1 comprises a memory 4, a user interface 5 and means 6 for performing mobile station functions, such as GSM and/or UMTS mobile communication means. The user interface 5 preferably com-20 prises a display, a keypad and audio means in a way known as such. For the connection of the peripheral device 2, the electronic device 1 is provided with connecting means 7 which comprise at least one connector 8 as well as the necessary I/O blocks 9, for example to connect the buses of the peripheral device 2 and the electronic device 1 to each 25

other.

The peripheral device is also provided with corresponding connecting means 10 for connecting the peripheral device 2 to the electronic device 1. The connecting means 10 of the peripheral device comprise at least one connector 11 which can be connected to the connector 8 of the electronic device 1, and an I/O block 12. The power supply to the peripheral device 2 is arranged from the electronic device 1 via the connectors 8, 11. The I/O blocks are used for communication between the electronic device 1 and the peripheral device 2. This can take place as parallel data transmission or serial data transmission. For example, said peripheral device according to the MultiMediaCard<sup>™</sup> specifica-

tions applies serial data transmission. However, in view of the present invention, it is not significant, in which format the data transmission between the electronic device 1 and the peripheral device 2 is carried out.

5

10

15

The peripheral device 2 also comprises a processor 13 or the like for controlling the functions of the peripheral device 2. Furthermore, the peripheral device comprises a memory 14, such as a read/write memory (RAM), *e.g.* for the storage of data, as well as a read-only memory (ROM, NVRAM) for the storage of the program code. The processor is responsible, for example, for controlling the I/O blocks in the data transmission between the peripheral device 2 and the electronic device 1. At least a first maximum value and a second maximum value for power consumption, which are used in the method according to the present invention, are also stored in the memory 14 of the peripheral device. Furthermore, the peripheral device comprises means for generating one or more clock signals required for the operation of the processor, such as a clock generator 16.

- The following is a description of the operation of the method according to a preferred embodiment of the invention in a system shown in Fig. 1. For example, information on whether a peripheral device 2 is placed in the connector 8 of the connecting means of the electronic device, is transmitted via the I/O blocks to the electronic device 1. This can be
- 25 implemented, for example, by providing the I/O block 9, 12 with a detection line 15 whose state is changed when the peripheral device 2 is placed in the connector 8. In this advantageous embodiment of the invention, the detection line 15 is implemented so that the detection line 15 is set in the logical 1 state by means of a pull-up resistance R in
- 30 the electronic device 1. In the system of Fig. 1, the change of state is achieved in such a way that the peripheral device 2 earths the detection line 15, wherein the state of the detection line 15 is changed to the logical 0 state. This change of state is detected in the electronic device 1, for example, in such a way that the change of state causes an interrupt in the control block 3, wherein a corresponding interrupt service program is run and the running of the initializing functions of the
  - service program is run and the running of the initializing functions of the peripheral device are started. After the operating voltages have been

coupled to the peripheral device, the processor 13 of the peripheral device 2 will start to run its own initializing operations. For example, the power consumption of the peripheral device 2 is set to a default value which, in this advantageous embodiment, is a power consumption value according to the first maximum limit. In this context, it is assumed that the first maximum limit is lower than the second maximum limit. The processor also sets the frequency of the clock generator 16 to correspond to this power consumption value. Typically, the frequency of the clock generator is set to a minimum value. In all peripheral devices 2, it is not necessarily possible to control the frequency of the clock generator 16, wherein the clock generator 16 cannot be used for controlling the power consumption.

5

10

In the operations of initializing the peripheral device, performed by the electronic device 1, the type of the peripheral device 2 is preferably examined, which may affect the type of initialization operations to be performed. However, this description will only discuss the operations which are essential in view of the invention. The signalling to be performed in this method according to the advantageous embodiment of

- 20 the invention is illustrated in a reduced manner in the appended Fig. 3. The determination of the type of the peripheral device 2 will be followed by determining the first and second maximum limits for power consumption which have been stored on the card. Thus, a maximum limit reading message is preferably transmitted from the electronic device 1
- 25 to the peripheral device 2. This is illustrated by arrow 301 in the chart of Fig. 3. The message is received in the peripheral device 2 and its content is preferably examined in a processor 13. On the basis of the message, the processor 13 reads the first maximum limit and the second maximum limit from the memory 14 (block 302 in Fig. 3). If there
- 30 are more than two maximum limits, the number of the maximum limits is preferably stored in the memory means, wherein the processor 13 reads the values of all the maximum limits from the memory 14. After this, the processor 13 generates a reply message (block 303) containing the requested information, such as the first and second maximum
- 35 limits and, if necessary, also the number of the maximum limits. In the case of several maximum limits, also the values of the other maximum limits are preferably included in the message. The message is trans-

mitted via the I/O blocks 9, 12 to the electronic device (arrow 304), in which the control block reads the information of the received message and, if necessary, stores them in the memory 4 of the electronic device.

- After the maximum limits of power consumption supported by the peripheral device are known in the electronic device 1, it is possible to start to adjust the power consumption of the peripheral device, if necessary. Let us assume that the electronic device 1 is capable of supplying the power corresponding to the second maximum limit to the peripheral device 2. Thus, a power control message is transmitted from the electronic device
- tronic device 1 to the peripheral device 2 (arrow 305). This power control message indicates the power consumption value which is to be set as the maximum value for the peripheral device 2, for example said second maximum limit. The processor 13 of the peripheral device
- 15 examines the type of the received message, and after determining that it is a power control message, reads the maximum value for power consumption indicated in the message (block 306). Next, the processor 13 of the peripheral device sets, for example the operating frequency of the clock generator 16 to a value corresponding to this 20 maximum value for power consumption, for example to the highest
- possible frequency. In some embodiments, the bus widths within the processor can also be changed according to the maximum limit used for power consumption. Furthermore, the peripheral device 2 preferably informs the electronic device 1 that the power consumption has been limited to the requested value (arrow 307).

If the electronic device 1 cannot supply the peripheral device 2 with the power of the second maximum limit, or if, for another reason, the electronic device 1 tends to set the maximum value for power consumption lower than the second maximum limit, it is possible to perform signalling, by which the electronic device 1 and the peripheral device try to find such a maximum limit for power consumption which is suitable in the situation. This can be carried out, for example, in such a way that the electronic device 1 selects, between the first and second maximum limits, a value which is a maximum value in view of the electronic device 1. Information about this limit is transferred to the peripheral device 2, in which the suggested value is examined 13, and if it is found acceptable, this information is transferred to the electronic device 1. If the peripheral device 2 cannot set its own power consumption to such a level which corresponds to the suggested maximum value, the peripheral device 2 will suggest a lower value between the first and second maximum values. If this value is possible in view of the

electronic device 1, the electronic device 1 will transmit this information

5

to the peripheral device 2, in which the power consumption is set to this value. If the value suggested by the peripheral device 2 is not suitable, the electronic device 1 advantageously selects another, preferably
lower value which, however, is at least equal to the first maximum limit, and reports it to the peripheral device 2. The above-presented steps are iterated, until such a power consumption value is found which is suitable for both the electronic device 1 and the peripheral device 2. In some cases, it may occur that the only suitable value is the first maximum limit, mum value, wherein the power consumption does not need to be adjusted, because this value is the default value.

There may also be a need to change the value of the power consumption during the operation of the electronic device 1 and the peripheral 20 device 2 connected to the same. For example, if the peripheral device is a transceiver card, such as a mobile station card or a modem card, there may be a need to significantly change the power consumption limit of the peripheral device 2, for example, for the time of a transmission. Thus, at the stage when e.g. the peripheral device 2 detects a 25 need to change the power consumption, it transmits a message to the electronic device 1 and proposes a new power consumption value which is, however, in the range between the first and second maximum values. An exchange of messages is performed between the electronic device 1 and the peripheral device 2 by applying the above-described 30 principles, to control the power consumption of the peripheral device according to the need. When the need for power consumption is changed again, a new adjustment of the power consumption can be made.

35 The need to change the power consumption of the peripheral device may also develop in the electronic device 1. For example, when the operation of the electronic device 1 shifts to a power saving mode, or

when the charge of a battery (not shown) in the electronic device is reduced, the electronic device 1 may control the peripheral device 2 to shift to a less power consuming state.

5 The peripheral device according to the invention can also be connected to such an electronic device 1 which does not have a possibility to adjust the power consumption. Thus, the peripheral device 2 sets a default value, *i.e.* preferably the first maximum limit, as the power consumption value. Consequently, the peripheral device according to the invention can also be connected to such an electronic device 1 in which the steps of the method according to the invention are not carried out to control the power consumption of the peripheral device 2.

Above, the use of more than two different maximum limits were mentioned as the maximum values for power consumption. In this context,
it is assumed that the other maximum limits are between the first and
second maximum limits. These different maximum limits are feasible,
for example, in such applications, in which different bus widths can be
selected in the peripheral device. For example, in the system of Fig. 2,
the bus width of the connection between the peripheral device and the
electronic device can be selected to be any of the three values: 8, 16 or

- 32 bits. At the same time, this bus width selected for the connection is, in this advantageous embodiment, also used in the internal bus 17 of the peripheral device 2. Typically, the power consumption is the higher,
- 25 the wider the bus used. Thus, the presumption is preferably that the bus width at the start-up stage is 8 bits, but the electronic device 1 and the peripheral device 2 may negotiate on the use of another bus width, *i.e.* on the change of the maximum limit for power consumption. This can be implemented by applying the principles described above. How30 ever, it will be obvious that said bus widths are only some non-restrict-
- 30 ever, it will be obvious that said bus widths are only some non-restricting examples of bus widths.

The frequency of the clock generator 16 of the peripheral device is not necessarily adjustable in a stepless manner, but it is possible to select
a value for the frequency from some predetermined values. Thus, the maximum limits for power consumption corresponding to these different frequencies can be stored as said maximum limits in the peripheral

device, or if only the first maximum limit (lowest power consumption) and the second maximum limit (highest power consumption) are stored, it is possible to perform the exchange of messages between the electronic device 1 and the peripheral device, as described above in this description, to adjust the suitable power consumption limit.

5

Consequently, the power consumption of the peripheral device 2 can be adjusted *e.g.* by changing the clock frequency and/or the bus width, but it is obvious that other methods for adjusting the power consumption are also known and are applicable in connection with the invention. The power consumption can also be controlled by controlling the operating voltage, if the operating voltage of the peripheral device 2 does not need to be a given constant value. Peripheral devices are known, in which the operating voltage can be selected to be, for example, either 3 V, 3.3 V, or 5 V. Yet another example to be mentioned in this context of the possibilities to control the power consumption of the peripheral device is to control the current consumption of the peripheral device.

Further, the power consumption of the peripheral device 2 can also be adjusted by changing the clock frequency of the bus of the connection between the peripheral device and the electronic device, if it is independently adjustable. The clock frequency of the bus can be changed *e.g.* by the electronic device 1 and/or by the peripheral device 2, if necessary. The electronic device 1 controls a clock generator(s) (not shown) which produces the timing signals for the bus according to the same principles than what was presented above.

In an advantageous embodiment of the invention, at least a part of the memory of the peripheral device 2 is divided into two or more memory blocks, to form so-called storage banks. Thus, in the peripheral device, one or more of these memory blocks can be selected for use, *e.g.* on the basis of the maximum power consumption value defined for the peripheral device 2. With higher power consumption values, it is typically possible to take more memory blocks into use than with lower power consumption values. Figure 4 shows an example of the structure of such a peripheral device. In the peripheral device 2 shown in Fig. 4,

the memory 14 is provided with four memory blocks 14a, 14b, 14c, 14d, but it will be obvious that in practical applications, the number of storage banks can, within the scope of the invention, also be other than four. To take the memory blocks 14a–14d into use and to remove them from service, connection lines 18a–18d are preferably provided from the processor 13, to couple *e.g.* the operating voltage to the desired memory blocks 14a–14d, or the coupling lines are used to switch each memory block 14a–14d either to an active mode or to a power-saving mode. Also the above-presented method can be used to control the power consumption of the peripheral device 2 instead of or in addition to the methods for controlling the power consumption as presented above in this description.

In the electronic device 1, the power control can be performed, for example, by providing the electronic device 1 with a power source whose output voltage can be changed. Thus, in the electronic device 1, the operating voltage to be supplied to the peripheral device is selected to be the voltage value corresponding to the power consumption at the time.

20

5

10

The method according to the invention can also be applied in the implementation of various contents for use in connection with electronic devices 1, for example in the following way. As the peripheral device 2, it is possible to use a memory card, such as a card complying with the definitions of the MultiMediaCard<sup>™</sup> standard, in which contents can be 25 stored. In this context, contents refer to data files, application programs, electronic books, audiovisual information, such as music, videos, etc. For example, a content provider stores such contents on the memory card. Thus, the memory card 2 is connected to an electronic device provided with means for transferring the content to the 30 memory card 2. Thus, before starting the storage, the electronic device and the memory card 2 set the power consumption of the memory card preferably to a value corresponding to the second maximum limit. This is possible, because in such an electronic device 1 used for storing contents, the power consumption of the memory card has hardly any 35 significance, but the electronic device 1 can supply the memory card 2 with the sufficient power. The storage can thus be performed at a

maximum rate, because the clock frequency and/or bus width of the memory card can be set to the maximum. Also, the checkup of the content stored on the memory card 2, to detect possible storage defects, can be performed at a maximum rate. Thanks to the maximum storage and/or checkup rate, the content production rate of the electronic device 1 can be increased when compared with methods of prior art.

5

In a corresponding manner, at the stage when the content stored on the memory card 2 is to be used in an electronic device 1, the power consumption of the memory card 2 can be set to a level which is suitable for the electronic device 1, for example to the lowest possible power consumption. Thus, when applying the method of the invention, the content production rate does not need to be limited according to the maximum power consumption value possible in the use of the content.

Because the method according to the invention can be used for the power control of the peripheral device, the peripheral device 2 can be connected to a variety of electronic devices. In some electronic devices, it is only possible to supply the peripheral device with the power (voltage and current) corresponding to the minimum power consumption, wherein the electronic device 1 does not need a large regulator, and the size of the electronic device does not need to be increased because of the need of space for a large regulator. On the other hand, power consumption does not need to be restricted in

- peripheral devices 2 to be developed, because the suitable power consumption value can be negotiated by the electronic device and the peripheral device. Thus, if the peripheral device is connected to such an electronic device, in which a relatively high power can be supplied
- to the peripheral device connection, the peripheral device can be used as efficiently as possible (with a high clock frequency / large bus width). At the stage of initialization, even such a peripheral device will operate with a lower power consumption, until a suitable power consumption value has been selected. In the system according to the invention, it is
   possible to provide for the use of peripheral devices which will be
- 35 possible to provide for the use of peripheral devices which will be developed in the future and may require even high power in electronic

devices. However, it is not necessary to consider cards with a high power consumption in the design of all electronic devices.

- It will be obvious that the steps to be taken in the setting of the power
  consumption can also be implemented in another way than the abovepresented handshake in the form of messages. For example, the connection means 7, 10 can be provided with connection lines which are used to set the power consumption of the peripheral device. Furthermore, the invention can be applied in such a way that certain alternative (allowable) values are defined for said maximum limits, wherein the first maximum limit and the second maximum limit for each peripheral device is selected from the set of these alternative limits.
- It should also be mentioned that the peripheral device 2 does not need
  to be a card-format peripheral device, but the peripheral device 2 used
  can also be another device which can be connected to the electronic
  device 1. One non-restrictive example to be mentioned of such a
  peripheral device is a camera which is connected, for example, to a
  wireless communication device, a computer, or the like. Thus, by controlling the power consumption, it is possible to affect the functional
  properties of the camera. For example, the rate of updating the images
  of the camera on the display of the electronic device may be lower with
  a lower power consumption than with a higher power consumption.
  Thus, the electronic device 1 may preferably set the power consumption.
- tion of the camera used as the peripheral device 2 on the basis of how high a power can be supplied by the electronic device 1 to the peripheral device. In an advantageous embodiment of the invention, also the user of the electronic device 1 can set a maximum limit for the power consumption, wherein the user can, if necessary, *e.g.* reduce the maximum limit to prolong the time of operation of the electronic device
- 30 maximum limit to prolong the time of operation of the electronic device.

It is obvious that the present invention is not limited solely to the abovepresented embodiments but it can be modified within the scope of the appended claims.

35

# <u>Claims:</u>

A method for determining the power consumption in an electronic device, to which a peripheral device is connected, to which the power is supplied from the electronic device, wherein the method comprising determining, for the power consumption, at least a first maximum value and a second maximum value which is higher than the first maximum value, and performing, between the electronic device and the peripheral device, setting of the maximum for the power consumption of the peripheral device to a value which is between said first and second maximum values.

2. The method according to claim 1, wherein said first maximum limit is used as a default value for the power consumption, wherein the power consumption of the peripheral device is set, at the startup stage, to be substantially not higher than said first maximum limit.

3. The method according to claim 1, **wherein** said second maximum limit is used as the highest allowable limit for the power consumption.

20

25

4. The method according to claim 1, wherein messages are transferred between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum limit and said second maximum limit.

5. The method according to claim 1, wherein at least one content is stored in the peripheral device, to be used in connection with the electronic device, wherein at the stage of storing the content, the power consumption set for the peripheral device is a value corresponding to said second maximum limit, and at the stage of using the content, the power consumption set for the peripheral device is a value corresponding to said first maximum limit.

35 6. The method according to the claim 1, wherein at least one clock signal is generated in the peripheral device and that the power

consumption of the peripheral device is controlled by adjusting the frequency of at least one clock signal.

5

7. The method according to the claim 1, **wherein** the peripheral device comprises at least one bus and that the power consumption of the peripheral device is controlled by controlling the bus width of the peripheral device.

8. The method according to the claim 1, wherein the peripheral device
is provided with two or more storage blocks (2) is controlled by controlling the number of storage blocksprocessed by the peripheral device substantially simultaneously.

9. A system comprising an electronic device with means for connecting
a peripheral device and means for supplying power to the peripheral device, and which system comprises means for determining the power consumption, wherein at least a first maximum value and a second maximum value which is higher than the first maximum value are defined for the power consumption, and that the means for determining
the power consumption comprise means for setting the maximum of the power consumption of the peripheral device to a value which is between said first maximum value and second maximum value.

10. The system according to claim 9, comprising means for transferring messages between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum limit and said second maximum limit.

30 11. The system according to claim 9, wherein the peripheral device comprises means for generating at least one clock signal, and that the system comprises means for controlling the power consumption of the peripheral device by adjusting the frequency of said at least one clock signal.

35

12. The system according to claim 9, wherein the peripheral device comprises at least one bus, and that the system comprises means for

controlling the power consumption of the peripheral device by adjusting the bus width of the peripheral device.

- 13. The method according to the claim 9, **wherein** the peripheral device is provided with two or more storage blocks, and that the means for controlling the power consumption of the peripheral device comprise means for adjusting the number of storage blocks processed by the peripheral device substantially simultaneously.
- 10 14. The system according to the claim 9, **wherein** the electronic device is a portable electronic device .

15. The system according to claim 14, comprising means for performing mobile station functions.

15

16. An electronic device provided with means for connecting a peripheral device and means for supplying power to the peripheral device, and means for determining the power consumption, wherein at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that the means for determining the power consumption comprise means for setting the maximum of the power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value.

25

30

17. The electronic device according to claim 16, comprising means for transmitting messages from the peripheral device and for receiving messages from the peripheral device, to set the power consumption of the peripheral device to a value substantially between said first maximum limit and said second maximum limit.

18. The electronic device according to claim 16, wherein it is a portable electronic device.

35 19. The electronic device according to claim 18, comprising means for performing mobile station functions.

20. A peripheral device provided with means for connecting the peripheral device to an electronic device, from which the power required for using the peripheral device is arranged to be supplied to the peripheral device, **wherein** at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that the peripheral device comprises means for setting the maximum of the power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value.

10

5

21. The peripheral device according to claim 20, **wherein** at least one content is stored in the peripheral device to be used in connection with the electronic device.

- 15 22. The peripheral device according to claim 20, comprising means for generating at least one clock signal and means for controlling the power consumption of the peripheral device by controlling the frequency of said at least one clock signal.
- 20 23. The peripheral device according to claim 20, comprising at least one bus and means for controlling the power consumption of the peripheral device by controlling the bus width of the peripheral device.

24. The peripheral device according to the claim 20, **wherein** the peripheral device is provided with two or more storage blocks, and that the means for controlling the power consumption of the peripheral device comprise means for controlling the number of storage blocks processed by the peripheral device substantially simultaneously.

30 25. The peripheral device according to the claim 20, **wherein** said first maximum value and said second maximum value are stored in the peripheral device.

26. The peripheral device according to the claim 20, wherein it is a MultiMediaCard<sup>™</sup> peripheral device.

35

# Abstract

The present invention relates to a method and a system for determining the power consumption in an electronic device, to which a peripheral device is connected, to which the power is supplied from the electronic device. At least a first maximum value and a second maximum value, higher than the first maximum value, are determined for the power consumption. Between the electronic device and the peripheral device, a maximum for the power consumption of the peripheral device is set to a value which is between said first and second maximum values. The invention also relates to an electronic device and a peripheral device, in which the method is applied.

#### **COMBINED DECLARATION AND POWER OF ATTORNEY**

(Docket Number)

As a below named inventor, I hereby declare that:

- my residence, post office address and citizenship are as stated below next to my name;
- I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled: A METHOD AND A SYSTEM FOR DETERMINING THE POWER CONSUMPTION IN CONNECTION WITH AN ELECTRONIC DEVICE, AND AN ELECTRONIC DEVICE;
- the specification of which is attached hereto unless the following box is checked:
  - the application was filed on
  - as U.S. Application Number
  - or PCT International Application Number

and was amended on (if applicable).

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in 37 CFR §1.56.

I hereby claim foreign priority benefits under 35 U.S.C. §119(a)-(d) or §365(b) of any foreign application(s) for patent or inventor's certificate, or §365(a) of any PCT International application which designated at least one country other than the United States, listed below and have also identified below, by checking the box, any foreign application for patent or inventor's certificate, or PCT International application having a filing date before that of the application on which priority is claimed.

Prior Foreign Application			Priority Not Claimed
20020594 (Application Number)	Finland (Country)	27/03/2002 (Day/Month/Year Filed)	
(Application Number)	(Country)	(Day/Month/Year Filed)	

To the extent permitted by rule or law, I hereby incorporate by reference the Prior Foreign Application(s) listed above.

I hereby claim the benefits under 35 U.S.C. §119(e) of any United States provisional application(s) listed below:

(Provisional Application Number)	(Day/Month/Year Filed)
(Provisional Application Number)	(Day/Month/Year Filed)

I hereby claim the benefit under 35 U.S.C. §120 of any United States application(s), or §365(c) of any PCT International application designating the United States, listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States or PCT International application in the manner provided by the first paragraph of 35 U.S.C. §112, I acknowledge the duty to disclose information which is material to patentability, as defined in 37 CFR §1.56, which became available between the filing date of the prior application and the national or PCT International filing date of this application.

(Application Number)	(Day/Month/Year Filed)	(Statuspatented, pending, abandoned)
(Application Number)	(Day/Month/Year Filed)	(Statuspatented, pending, abandoned)

The undersigned hereby authorizes the U.S. firm of Ware, Fressola, Van Der Sluys & Adolphson LLP to accept and follow instructions from the Finnish firm of Tampereen Patenttitoimisto Oy as to any action to be taken in the U.S. Patent and Trademark Office regarding this application without direct communication between the U.S. firm will be so notified by the undersigned or his successors and assigns. I hereby appoint the attorney(s) and/or agent(s) assigned to the customer number listed below, as may from time to time be amended, belonging to the firm of Ware, Fressola, Van Der Sluys & Adolphson LLP, to prosecute this application and to transact all business in the USPTO:

Address all telephone calls to: Ware, Fressola, Van Der Sluys & Adolphson LLP at (203) 261-1234. Address all correspondence to:

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

Tampereen Patenttitoimisto Oy Hermiankatu 12 B FIN-33720 TAMPERE Finland A method and a system for determining the power consumption in connection with an electronic device, and an electronic device

- 5 The present invention relates to a method for determining the power consumption in an electronic device, to which a peripheral device is connected, which is supplied with power from the electronic device. The invention also relates to a system which comprises an electronic device provided with means for connecting a peripheral device and
- 10 means for supplying power to the peripheral device, and which system comprises means for determining the power consumption. Furthermore, the invention relates to an electronic device provided with means for connecting a peripheral device, means for supplying power to the peripheral device, and means for determining the power consumption
- 15 of the peripheral device. Moreover, the invention relates to a peripheral device provided with means for connecting the peripheral device to an electronic device, from which the power needed for using the peripheral device is arranged to be supplied to the peripheral device.
- 20 At present, several such electronic devices are in use, to which it is possible to connect various peripheral devices, *e.g.* to expand the properties of the electronic device and to produce auxiliary functions. For example, it is possible to connect peripheral devices, such as connection cards (*e.g.* PCMCIA cards), to laptop computers to connect the
- 25 laptop computer to a local area network, a landline or wireless telephone network, *etc.* Furthermore, peripheral devices can be used to expand the memory of the laptop computer, to connect an external fixed disk, a CDROM station, or the like.
- 30 The MultiMediaCard<sup>™</sup> Association is, among other things, developing a standard for memory expansion boards (MultiMediaCard<sup>™</sup>; Multi-MediaCard<sup>™</sup> is a trademark of Infineon Technologies AG). These memory expansion boards can be used in various portable electronic devices, such as wireless communication devices and communicator 35 type devices, to expand the memory capacity.

ويتسخ و

Because the peripheral devices can be connected to a variety of devices, the power consumption of the peripheral device should not exceed the maximum power that can be supplied from the electronic device to the peripheral device. Otherwise, the operation of the peripheral device and/or the electronic device may be disturbed and the 5 electronic device may even be overheated. On the other hand, the power consumption requirements of different peripheral devices may be very different, wherein manufacturers of electronic devices should provide for the maximum power consumption in the power supply of 10 the peripheral device connection. Solutions are known, such as Nokia Communicator 9110/9210, in which the power supply of the peripheral device connection of the electronic device is provided with a relatively efficient regulator, for example in the order of 150 mA/3 V. Such an efficient regulator is a relatively bulky component, which may cause placement problems, particularly in portable electronic devices. The 15 provision for the maximum power consumption will be unnecessary in such electronic devices, whose users do not use, in connection with the electronic device, such a peripheral device whose power consumption is close to the maximum power consumption of the peripheral 20 device designed for the electronic device. On the other hand, another user of a similar electronic device may use such a peripheral device whose power consumption is in the order of the maximum power con-

In some electronic devices and peripheral devices to be connected to them, the operating voltage is selected at the stage when the peripheral device is turned on, *e.g.* when the electronic device is turned on or when the peripheral device is connected. Thus, signalling will be performed between the electronic device and the peripheral device, for the electronic device to determine the level of the operating voltage required by the peripheral device and to select an operating voltage suitable for the peripheral device to the operating voltage line(s) of the peripheral device.

sumption of the peripheral device designed for the electronic device.

35 In said MultiMediaCard Association, a maximum limit has been proposed for the power consumption of memory cards of the MultiMedia-Card<sup>™</sup> type. Thus, in electronic devices supporting this standard, the provision is made to supply a defined maximum power to the peripheral device. Moreover, the power consumption of memory cards of the MultiMediaCard<sup>™</sup> type should thus not exceed the defined maximum limit. Such an arrangement is difficult, for example, for the reason that the power consumption of new memory cards to be developed is limited to this maximum value, wherein it may be an impediment for the implementation of such memory cards whose power consumption cannot be made smaller than the selected maximum limit. If the maximum limit is set so high that the power consumption of other memory cards to be developed later on is also very likely to be smaller than this, it will mean that relatively efficient and large regulators must be used in electronic devices.

The power consumption of the peripheral device is normally proportional to the clock frequency used in the peripheral device, wherein an increase in the clock frequency will increase the power consumption. In a corresponding manner, to decrease the power consumption, the clock frequency of the peripheral device can be decreased, if this is possible in view of the other functions of the peripheral device. However, the operating rate of the peripheral device will thus decrease, which is not necessarily desirable. Also, the bus width used in the peripheral device has an effect on how much power is consumed in the peripheral device.

25 It is an aim of the present invention to provide an improved method and system for determining the power consumption to be suitable in each situation. It is another aim of the invention to provide an electronic device and a peripheral device for applying the method. The invention is based on the idea of determining at least a first and a second maxi-30 mum value for the power consumption, wherein the electronic device and the peripheral device set the power consumption to a value between these first and second maximum values. Thus, in different operating situations, for example the peripheral device can adjust its power consumption to be suitable for the situation. The method 35 according to the present invention is primarily characterized in determining, for the power consumption, at least a first maximum value and a second maximum value which is higher than the first maximum value,

3

21

and setting, between the electronic device and the peripheral device, the maximum for the power consumption of the peripheral device to a value which is substantially between said first and second maximum values. The system according to the invention is primarily characterized in that at least a first maximum value and a second maximum 5 value which is higher than the first maximum value, are defined for the power consumption, and that the means for determining the power consumption comprise means for setting the maximum for the power consumption of the peripheral device to a value which is between said 10 first maximum value and said second maximum value. The electronic device according to the invention is primarily characterized in that at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that the means for determining the power consumption

- 15 comprise means for setting the maximum for the power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value. Furthermore, the peripheral device according to the invention is primarily characterized in that at least a first maximum value and a second maximum value which is
- 20 higher than the first maximum value, are defined for the power consumption, and that the means for determining the power consumption comprise means for setting the maximum for the power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value.

25

14

The present invention shows remarkable advantages over solutions of prior art. By the method according to the invention, it is possible to avoid the use of an unnecessarily large regulator in an electronic device, which saves costs, and wherein the size of the electronic device can, in some cases, be reduced and, on the other hand, problems of heating caused by high power consumption can be avoided. Also the power consumption can be reduced, which is advantageous particularly in portable devices. By means of the invention, the peripheral device connection can also be provided with flexibility, because the power consumption of the peripheral device can be adjusted and set to a value suitable for each situation of use. Also, the clock frequency and bus width of the peripheral device can be changed in the system according to an advantageous embodiment of the invention. Furthermore, the invention makes it possible that new peripheral devices to be developed will function in connection with electronic devices made earlier, and existing peripheral devices will function in connection with new electronic devices to be developed. With the solution according to the invention, it is also possible to achieve an improvement in the userfriendliness of the electronic device, for example, in a situation in which

the peripheral device cannot fully operate on a lower level of power

consumption but it can, however, inform the electronic device about
 this. Thus, the electronic device can take care of the shutdown (turning off) of the peripheral device in the appropriate way and notify the user of this.

In the following, the invention will be described in more detail with reference to the appended drawings, in which

- Fig. 1 shows the system according to a preferred embodiment of the invention in a reduced block chart,
- 20 Fig. 2 shows a system according to a second preferred embodiment of the invention in a reduced manner,
  - Fig. 3 shows signalling in the method according to a preferred embodiment of the invention in a reduced manner, and

25

5

F,

- Fig. 4 shows a peripheral device according to yet another preferred embodiment of the invention in a reduced block chart.
- 30 In the system according to an advantageous embodiment of the invention, shown in Fig. 1, the electronic device 1 is exemplified by a wireless communication device. In this example, the peripheral device 2 is a memory card, such as a memory card complying with the Multi-MediaCard<sup>™</sup> standard. However, it will be obvious that the present invention is not limited solely to such electronic devices and peripheral devices, but the invention can also be applied in connection with other electronic devices and peripheral device 2 can

۶,

be, for example, an interface card or also another device. The electronic device 1 contains a control block 3 comprising one or more processors, such as a micro controller unit (MCU). Furthermore, the electronic device 1 comprises a memory 4, a user interface 5 and means 6
for performing mobile station functions, such as GSM and/or UMTS mobile communication means. The user interface 5 preferably comprises a display, a keypad and audio means in a way known as such. For the connection of the peripheral device 2, the electronic device 1 is provided with connecting means 7 which comprise at least one connect the buses of the peripheral device 2 and the electronic device 1 to each other.

The peripheral device is also provided with corresponding connecting 15 means 10 for connecting the peripheral device 2 to the electronic device 1. The connecting means 10 of the peripheral device comprise at least one connector 11 which can be connected to the connector 8 of the electronic device 1, and an I/O block 12. The power supply to the peripheral device 2 is arranged from the electronic device 1 via the 20 connectors 8, 11. The I/O blocks are used for communication between the electronic device 1 and the peripheral device 2. This can take place as parallel data transmission or serial data transmission. For example, said peripheral device according to the MultiMediaCard<sup>™</sup> specifications applies serial data transmission. However, in view of the present 25 invention, it is not significant, in which format the data transmission between the electronic device 1 and the peripheral device 2 is carried out.

The peripheral device 2 also comprises a processor 13 or the like for controlling the functions of the peripheral device 2. Furthermore, the peripheral device comprises a memory 14, such as a read/write memory (RAM), *e.g.* for the storage of data, as well as a read-only memory (ROM, NVRAM) for the storage of the program code. The processor is responsible, for example, for controlling the I/O blocks in the data transmission between the peripheral device 2 and the electronic device 1. At least a first maximum value and a second maximum value for power consumption, which are used in the method according to the present invention, are also stored in the memory 14 of the peripheral device. Furthermore, the peripheral device comprises means for generating one or more clock signals required for the operation of the processor, such as a clock generator 16.

5

10

۶,

The following is a description of the operation of the method according to a preferred embodiment of the invention in a system shown in Fig. 1. For example, information on whether a peripheral device 2 is placed in the connector 8 of the connecting means of the electronic device, is transmitted via the I/O blocks to the electronic device 1. This can be implemented, for example, by providing the I/O block 9, 12 with a detection line 15 whose state is changed when the peripheral device 2 is placed in the connector 8. In this advantageous embodiment of the

invention, the detection line 15 is implemented so that the detection

- 15 line 15 is set in the logical 1 state by means of a pull-up resistance R in the electronic device 1. In the system of Fig. 1, the change of state is achieved in such a way that the peripheral device 2 earths the detection line 15, wherein the state of the detection line 15 is changed to the logical 0 state. This change of state is detected in the electronic
- 20 device 1, for example, in such a way that the change of state causes an interrupt in the control block 3, wherein a corresponding interrupt service program is run and the running of the initializing functions of the peripheral device are started. After the operating voltages have been coupled to the peripheral device, the processor 13 of the peripheral
- 25 device 2 will start to run its own initializing operations. For example, the power consumption of the peripheral device 2 is set to a default value which, in this advantageous embodiment, is a power consumption value according to the first maximum limit. In this context, it is assumed that the first maximum limit is lower than the second maximum limit.
- 30 The processor also sets the frequency of the clock generator 16 to correspond to this power consumption value. Typically, the frequency of the clock generator is set to a minimum value. In all peripheral devices 2, it is not necessarily possible to control the frequency of the clock generator 16, wherein the clock generator 16 cannot be used for 35 controlling the power consumption.

In the operations of initializing the peripheral device, performed by the electronic device 1, the type of the peripheral device 2 is preferably examined, which may affect the type of initialization operations to be performed. However, this description will only discuss the operations which are essential in view of the invention. The signalling to be per-5 formed in this method according to the advantageous embodiment of the invention is illustrated in a reduced manner in the appended Fig. 3. The determination of the type of the peripheral device 2 will be followed by determining the first and second maximum limits for power consumption which have been stored on the card. Thus, a maximum limit 10 reading message is preferably transmitted from the electronic device 1 to the peripheral device 2. This is illustrated by arrow 301 in the chart of Fig. 3. The message is received in the peripheral device 2 and its content is preferably examined in a processor 13. On the basis of the 15 message, the processor 13 reads the first maximum limit and the second maximum limit from the memory 14 (block 302 in Fig. 3). If there are more than two maximum limits, the number of the maximum limits is preferably stored in the memory means, wherein the processor 13 reads the values of all the maximum limits from the memory 14. After 20 this, the processor 13 generates a reply message (block 303) containing the requested information, such as the first and second maximum limits and, if necessary, also the number of the maximum limits. In the case of several maximum limits, also the values of the other maximum

- limits are preferably included in the message. The message is transmitted via the I/O blocks 9, 12 to the electronic device (arrow 304), in which the control block reads the information of the received message and, if necessary, stores them in the memory 4 of the electronic device.
- After the maximum limits of power consumption supported by the peripheral device are known in the electronic device 1, it is possible to start to adjust the power consumption of the peripheral device, if necessary. Let us assume that the electronic device 1 is capable of supplying the power corresponding to the second maximum limit to the peripheral device 2. Thus, a power control message is transmitted from the electronic device 1 to the peripheral device 2 (arrow 305). This power control message indicates the power consumption value which is to be set as the maximum value for the peripheral device 2, for example said
second maximum limit. The processor 13 of the peripheral device examines the type of the received message, and after determining that it is a power control message, reads the maximum value for power consumption indicated in the message (block 306). Next, the processor 13 of the peripheral device sets, for example the operating frequency of the clock generator 16 to a value corresponding to this maximum value for power consumption, for example to the highest possible frequency. In some embodiments, the bus widths within the processor can also be changed according to the maximum limit used for power consumption. Furthermore, the peripheral device 2 preferably informs the electronic device 1 that the power consumption has been limited to the requested value (arrow 307).

If the electronic device 1 cannot supply the peripheral device 2 with the power of the second maximum limit, or if, for another reason, the elec-15 tronic device 1 tends to set the maximum value for power consumption lower than the second maximum limit, it is possible to perform signalling, by which the electronic device 1 and the peripheral device try to find such a maximum limit for power consumption which is suitable in 20 the situation. This can be carried out, for example, in such a way that the electronic device 1 selects, between the first and second maximum limits, a value which is a maximum value in view of the electronic device 1. Information about this limit is transferred to the peripheral device 2, in which the suggested value is examined 13, and if it is 25 found acceptable, this information is transferred to the electronic device 1. If the peripheral device 2 cannot set its own power consumption to such a level which corresponds to the suggested maximum value, the peripheral device 2 will suggest a lower value between the first and second maximum values. If this value is possible in view of the electronic device 1, the electronic device 1 will transmit this information 30 to the peripheral device 2, in which the power consumption is set to this value. If the value suggested by the peripheral device 2 is not suitable, the electronic device 1 advantageously selects another, preferably lower value which, however, is at least equal to the first maximum limit, 35 and reports it to the peripheral device 2. The above-presented steps are iterated, until such a power consumption value is found which is suitable for both the electronic device 1 and the peripheral device 2. In

۶,

5

10

some cases, it may occur that the only suitable value is the first maximum value, wherein the power consumption does not need to be adjusted, because this value is the default value.

- There may also be a need to change the value of the power consump-5 tion during the operation of the electronic device 1 and the peripheral device 2 connected to the same. For example, if the peripheral device is a transceiver card, such as a mobile station card or a modem card, there may be a need to significantly change the power consumption
- limit of the peripheral device 2, for example, for the time of a transmis-10 sion. Thus, at the stage when e.g. the peripheral device 2 detects a need to change the power consumption, it transmits a message to the electronic device 1 and proposes a new power consumption value which is, however, in the range between the first and second maximum
- values. An exchange of messages is performed between the electronic 15 device 1 and the peripheral device 2 by applying the above-described principles, to control the power consumption of the peripheral device according to the need. When the need for power consumption is changed again, a new adjustment of the power consumption can be
- 20 made.

The need to change the power consumption of the peripheral device may also develop in the electronic device 1. For example, when the operation of the electronic device 1 shifts to a power saving mode, or 25 when the charge of a battery (not shown) in the electronic device is reduced, the electronic device 1 may control the peripheral device 2 to shift to a less power consuming state.

The peripheral device according to the invention can also be connected to such an electronic device 1 which does not have a possibility to 30 adjust the power consumption. Thus, the peripheral device 2 sets a default value, *i.e.* preferably the first maximum limit, as the power consumption value. Consequently, the peripheral device according to the invention can also be connected to such an electronic device 1 in 35 which the steps of the method according to the invention are not carried out to control the power consumption of the peripheral device 2.

Above, the use of more than two different maximum limits were mentioned as the maximum values for power consumption. In this context, it is assumed that the other maximum limits are between the first and second maximum limits. These different maximum limits are feasible, for example, in such applications, in which different bus widths can be selected in the peripheral device. For example, in the system of Fig. 2, the bus width of the connection between the peripheral device and the electronic device can be selected to be any of the three values: 8, 16 or 32 bits. At the same time, this bus width selected for the connection is, in this advantageous embodiment, also used in the internal bus 17 of the peripheral device 2. Typically, the power consumption is the higher, the wider the bus used. Thus, the presumption is preferably that the bus width at the start-up stage is 8 bits, but the electronic device 1 and the peripheral device 2 may negotiate on the use of another bus width,

*i.e.* on the change of the maximum limit for power consumption. This can be implemented by applying the principles described above. However, it will be obvious that said bus widths are only some non-restrict-ing examples of bus widths.

20 The frequency of the clock generator 16 of the peripheral device is not necessarily adjustable in a stepless manner, but it is possible to select a value for the frequency from some predetermined values. Thus, the maximum limits for power consumption corresponding to these different frequencies can be stored as said maximum limits in the peripheral device, or if only the first maximum limit (lowest power consumption) and the second maximum limit (highest power consumption) are stored, it is possible to perform the exchange of messages between the electronic device 1 and the peripheral device, as described above in this description, to adjust the suitable power consumption limit.

30

35

s.

5

10

Consequently, the power consumption of the peripheral device 2 can be adjusted *e.g.* by changing the clock frequency and/or the bus width, but it is obvious that other methods for adjusting the power consumption are also known and are applicable in connection with the invention. The power consumption can also be controlled by controlling the operating voltage, if the operating voltage of the peripheral device 2 does not need to be a given constant value. Peripheral devices are known, in which the operating voltage can be selected to be, for example, either 3 V, 3.3 V, or 5 V. Yet another example to be mentioned in this context of the possibilities to control the power consumption of the peripheral device is to control the current consumption of the peripheral device.

In an advantageous embodiment of the invention, at least a part of the memory of the peripheral device 2 is divided into two or more memory blocks, to form so-called storage banks. Thus, in the peripheral device,
one or more of these memory blocks can be selected for use, *e.g.* on the basis of the maximum power consumption value defined for the peripheral device 2. With higher power consumption values, it is typically possible to take more memory blocks into use than with lower power consumption values. Figure 4 shows an example of the structure

- 15 of such a peripheral device. In the peripheral device 2 shown in Fig. 4, the memory 14 is provided with four memory blocks 14a, 14b, 14c, 14d, but it will be obvious that in practical applications, the number of storage banks can, within the scope of the invention, also be other than four. To take the memory blocks 14a–14d into use and to remove them
- from service, connection lines 18a–18d are preferably provided from the processor 13, to couple *e.g.* the operating voltage to the desired memory blocks 14a–14d, or the coupling lines are used to switch each memory block 14a–14d either to an active mode or to a power-saving mode. Also the above-presented method can be used to control the power consumption of the peripheral device 2 instead of or in addition to the methods for controlling the power consumption as presented above in this description.

In the electronic device 1, the power control can be performed, for example, by providing the electronic device 1 with a power source whose output voltage can be changed. Thus, in the electronic device 1, the operating voltage to be supplied to the peripheral device is selected to be the voltage value corresponding to the power consumption at the time.

35

5

The method according to the invention can also be applied in the implementation of various contents for use in connection with electronic

devices 1, for example in the following way. As the peripheral device 2, it is possible to use a memory card, such as a card complying with the definitions of the MultiMediaCard<sup>™</sup> standard, in which contents can be stored. In this context, contents refer to data files, application programs, electronic books, audiovisual information, such as music, videos, etc. For example, a content provider stores such contents on the memory card. Thus, the memory card 2 is connected to an electronic device provided with means for transferring the content to the memory card 2. Thus, before starting the storage, the electronic device and the memory card 2 set the power consumption of the memory card preferably to a value corresponding to the second maximum limit. This is possible, because in such an electronic device 1 used for storing contents, the power consumption of the memory card has hardly any significance, but the electronic device 1 can supply the memory card 2 with the sufficient power. The storage can thus be performed at a maximum rate, because the clock frequency and/or bus width of the

15

5

10

memory card can be set to the maximum. Also, the checkup of the content stored on the memory card 2, to detect possible storage defects, can be performed at a maximum rate. Thanks to the maximum 20 storage and/or checkup rate, the content production rate of the electronic device 1 can be increased when compared with methods of prior art.

In a corresponding manner, at the stage when the content stored on 25 the memory card 2 is to be used in an electronic device 1, the power consumption of the memory card 2 can be set to a level which is suitable for the electronic device 1, for example to the lowest possible power consumption. Thus, when applying the method of the invention, the content production rate does not need to be limited according to the 30 maximum power consumption value possible in the use of the content.

Because the method according to the invention can be used for the power control of the peripheral device, the peripheral device 2 can be connected to a variety of electronic devices. In some electronic 35 devices, it is only possible to supply the peripheral device with the power (voltage and current) corresponding to the minimum power consumption, wherein the electronic device 1 does not need a large regulator, and the size of the electronic device does not need to be increased because of the need of space for a large regulator. On the other hand, power consumption does not need to be restricted in peripheral devices 2 to be developed, because the suitable power consumption value can be negotiated by the electronic device and the peripheral device. Thus, if the peripheral device is connected to such an electronic device, in which a relatively high power can be supplied to the peripheral device connection, the peripheral device can be used as efficiently as possible (with a high clock frequency / large bus width).

5

- 10 At the stage of initialization, even such a peripheral device will operate with a lower power consumption, until a suitable power consumption value has been selected. In the system according to the invention, it is possible to provide for the use of peripheral devices which will be developed in the future and may require even high power in electronic
- 15 devices. However, it is not necessary to consider cards with a high power consumption in the design of all electronic devices.

It will be obvious that the steps to be taken in the setting of the power consumption can also be implemented in another way than the above-presented handshake in the form of messages. For example, the connection means 7, 10 can be provided with connection lines which are used to set the power consumption of the peripheral device. Furthermore, the invention can be applied in such a way that certain alternative (allowable) values are defined for said maximum limits, wherein the first maximum limit and the second maximum limit for each peripheral device is selected from the set of these alternative limits.

It should also be mentioned that the peripheral device 2 does not need to be a card-format peripheral device, but the peripheral device 2 used can also be another device which can be connected to the electronic device 1. One non-restrictive example to be mentioned of such a peripheral device is a camera which is connected, for example, to a wireless communication device, a computer, or the like. Thus, by controlling the power consumption, it is possible to affect the functional properties of the camera. For example, the rate of updating the images of the camera on the display of the electronic device may be lower with a lower power consumption than with a higher power consumption. 15 Thus, the electronic device 1 may preferably set the power consumption of the camera used as the peripheral device 2 on the basis of how high a power can be supplied by the electronic device 1 to the peripheral device. In an advantageous embodiment of the invention, also the user of the electronic device 1 can set a maximum limit for the power

- 5 user of the electronic device 1 can set a maximum limit for the power consumption, wherein the user can, if necessary, *e.g.* reduce the maximum limit to prolong the time of operation of the electronic device.
- It is obvious that the present invention is not limited solely to the abovepresented embodiments but it can be modified within the scope of the appended claims.

### Claims:

A method for determining the power consumption in an electronic device (1), to which a peripheral device (2) is connected, to which the power is supplied from the electronic device (1), characterized in determining, for the power consumption, at least a first maximum value and a second maximum value which is higher than the first maximum value, and setting, between the electronic device (1) and the peripheral device (2), the maximum for the power consumption of the peripheral device (2) to a value which is substantially between said first and second maximum values.

The method according to claim 1, characterized in that said first maximum limit is used as a default value for the power consumption,
 wherein the power consumption of the peripheral device (2) is set, at the startup stage, to be substantially not higher than said first maximum limit.

3. The method according to claim 1 or 2, characterized in that said
second maximum limit is used as the highest allowable limit for the power consumption.

4. The method according to claim 1, 2, or 3, characterized in that messages are transferred between the electronic device (1) and the peripheral device (2) for setting the power consumption of the peripheral device to a value substantially between said first maximum limit and said second maximum limit.

5. The method according to any of the claims 1 to 4, characterized in
that at least one content is stored in the peripheral device (2), to be used in connection with the electronic device (1), wherein at the stage of storing the content, the power consumption set for the peripheral device (1) is a value corresponding to said second maximum limit, and at the stage of using the content, the power consumption set for the stage of the stage of using the content, the power consumption set for the init.

6. The method according to any of the claims 1 to 5, **characterized** in that at least one clock signal is generated in the peripheral device (2) and that the power consumption of the peripheral device (2) is controlled by adjusting the frequency of at least one clock signal.

5

7. The method according to any of the claims 1 to 6, **characterized** in that the peripheral device (2) comprises at least one bus and that the power consumption of the peripheral device (2) is controlled by controlling the bus width of the peripheral device (2).

10

8. The method according to any of the claims 1 to 7, **characterized** in that the peripheral device (2) is provided with two or more storage blocks (14a–14d), wherein the power consumption of the peripheral device (2) is controlled by controlling the number of storage blocks (14a–14d) processed by the peripheral device (2) substantially simul-

15

taneously.

9. A system comprising an electronic device (1) with means (7) for connecting a peripheral device (2) and means (8) for supplying power
to the peripheral device (2), and which system comprises means (7, 10, 14) for determining the power consumption, characterized in that at least a first maximum value and a second maximum value which is higher than the first maximum value are defined for the power consumption, and that the means for determining the power consumption
comprise means 3, 13, 16, 17) for setting the maximum of the power consumption of the peripheral device (2) to a value which is between said first maximum value and second maximum value.

10. The system according to claim 9, characterized in that it comprises means (7, 10) for transferring messages between the electronic device (1) and the peripheral device (2) for setting the power consumption of the peripheral device to a value substantially between said first maximum limit and said second maximum limit.

35 11. The system according to claim 9 or 10, **characterized** in that the peripheral device (2) comprises means (16) for generating at least one clock signal, and that the system comprises means (7, 10, 13) for

controlling the power consumption of the peripheral device (2) by adjusting the frequency of said at least one clock signal.

- 12. The system according to claim 9, 10, or 11, characterized in that
  the peripheral device (2) comprises at least one bus, and that the system comprises means (7, 10, 13) for controlling the power consumption of the peripheral device (2) by adjusting the bus width of the peripheral device (2).
- 13. The method according to any of the claims 9 to 12, characterized in that the peripheral device (2) is provided with two or more storage blocks (14a–14d), and that the means (7, 10, 13) for controlling the power consumption of the peripheral device (2) comprise means (13, 18a–18d) for adjusting the number of storage blocks (14a–14d) proc15 essed by the peripheral device (2) substantially simultaneously.

14. The system according to any of the claims 9 to 13, **characterized** in that the electronic device (1) is a portable electronic device (1).

20 15. The system according to claim 14, **characterized** in that it comprises means (6) for performing mobile station functions.

16. An electronic device (1) provided with means (7) for connecting a peripheral device (2) and means (8) for supplying power to the peripheral device (2), and means (7) for determining the power consumption, characterized in that at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that the means for determining the power consumption comprise means (3) for setting the maximum of the power consumption of the peripheral device (2) to a value which is between said first maximum value and said second maximum value.

17. The electronic device (1) according to claim 16, **characterized** in that it comprises means (7) for transmitting messages from the peripheral device (2) and for receiving messages from the peripheral device (2), to set the power consumption of the peripheral device to a value

35

18

substantially between said first maximum limit and said second maximum limit.

18. The electronic device (1) according to claim 16 or 17, characterized in that it is a portable electronic device (1).

19. The electronic device (1) according to claim 18, **characterized** in that it comprises means for performing mobile station functions.

10 20. A peripheral device (2) provided with means (10) for connecting the peripheral device (2) to an electronic device (1), from which the power required for using the peripheral device (2) is arranged to be supplied to the peripheral device (2), **characterized** in that at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for the power consumption, and that the peripheral device comprises means (13, 16, 17) for setting the maximum of the power consumption of the peripheral device (2) to a value which is between said first maximum value and said second maximum value.

20

21. The peripheral device (2) according to claim 20, **characterized** in that at least one content is stored in the peripheral device (2) to be used in connection with the electronic device (1).

25 22. The peripheral device (2) according to claim 20 or 21, **characterized** in that the peripheral device (2) comprises means (16) for generating at least one clock signal and means (13) for controlling the power consumption of the peripheral device (2) by controlling the frequency of said at least one clock signal.

30

23. The peripheral device (2) according to claim 20, 21, or 22, **characterized** in that the peripheral device (2) comprises at least one bus and means (13) for controlling the power consumption of the peripheral device (2) by controlling the bus width of the peripheral device (2).

35

24. The peripheral device (2) according to any of the claims 20 to 23, **characterized** in that the peripheral device (2) is provided with two or

۰,

5

more storage blocks (14a–14d), and that the means (7, 10, 13) for controlling the power consumption of the peripheral device (2) comprise means (13, 18a–18d) for controlling the number of storage blocks (14a–14d) processed by the peripheral device (2) substantially simultaneously.

25. The peripheral device (2) according to any of the claims 20 to 24, **characterized** in that it is a MultiMediaCard<sup>™</sup> peripheral device.

#### Abstract

-,

The present invention relates to a method and a system for determining the power consumption in an electronic device (1), to which a peripheral device (2) is connected, to which the power is supplied from the electronic device (1). At least a first maximum value and a second maximum value, higher than the first maximum value, are determined for the power consumption. Between the electronic device (1) and the peripheral device (2), a maximum for the power consumption of the peripheral device (2) is set to a value which is substantially between said first and second maximum values. The invention also relates to an electronic device (1) and a peripheral device (2), in which the method is applied.

Patent application No.20020594Class:G01RAVApplicant:Nokia CorporationAttorney:Tampereen Patenttitoimisto OyAttorney's reference:TP101235/TPuTerm17 August 2003

The number and class of the patent application must be mentioned in your letter to the National Board of Patents and Registration

The independent claims 1, 9, 16 and 20 present an arrangement to be used for determining the power consumption of an electronic device, whereby a first maximum value and a second maximum value which is higher than the first maximum value, and setting, between the electronic device and the peripheral device, the maximum for the power consumption of the peripheral device to a value which is substantially between said first and second maximum values.

Publication WO 02/07494 (Sierra Wireless Inc., 31 January 2002, abstract and claim 1) discloses an arrangement, in which the power consumption of a portable computer and a PCMCIA card connected to it is limited to a value such that provides a current output which is between the values of two standard outputs. Because the arrangement presented in claims 1, 9, 16 and 20 is thus, in its essential parts, previously known from the publication WO 02/07494, the claims can thus not be accepted (Patent Act, Paragraph 2). Other claims present technical solutions which are known as such, for example, from US patent publications 5,606,704 (G06F 1/32, Pierce *et al.*, 25 February 1997), 5,613,130 (G06F 1/26, Teng *et al.*, 18 March 1997) and 5,737,616 (G06F 1/26, Watanabe, 7 April 1998).

The abstract in Swedish is missing.

Enclosures: Search report and copies of the references

Your response to the remarks is to be filed by the above mentioned due date. Upon failure to file a response with the Patent Office by the above-indicated due date or upon failure to take measures to correct the deficiencies stated in the present Official Action, the application is deemed to be withdrawn (Patent Act, 15 §). An application that is deemed to be withdrawn will be accepted under revival if you file your response or take measures to correct the stated defects within four months from the due date and, within the same term, pay the confirmed fee for revival of the application. If your response is filed at the Patent Office in due time, but the stated defects are not corrected in a manner that the application could be accepted, it is rejected, unless the Patent Office has a cause to issue a new Official Action (Patent Act, 16 §). A new specification, corrections made therein, and new claims shall always be filed in duplicate and thus Section 19 of the Patent Decree has to be taken into account.

The fee is based on Decree 1027/2001, with amendments, on the services payable to the National Board of Patents and Registration, issued by the Ministry of Trade and Industry.

Patenttihakemus nro: Luokka: Hakija: Asiamies: Asiamiehen viite: 20020594 GOIR AV Nokia Corporation Tampereen Patenttitoimisto Oy TP101235/TPu

Määräpäivä:

Patenttihakemuksen numero ja luokka on mainittava kirjelmässänne PRH:lle

17.08.2003

Itsenäisissä patenttivaatimuksissa 1, 9, 16 ja 20 esitetään elektroniikkalaitteen tehonkulutuksen määrittämisessä käytettävä järjestely, jossa määritetään tehonkulutukselle ensimmäinen maksimiarvo ja ensimmäistä maksimiarvoa suurempi toinen maksimiarvo ja elektroniikkalaitteen ja oheislaitteen välillä suoritetaan oheislaitteen tehonkulutuksen maksimin asettaminen arvoon, joka on olennaisesti ensimmäisen ja toisen maksimiarvon välissä.

Julkaisusta WO-02/07494 (Sierra Wireless Inc., 31.1.02, tiivistelmä ja vaatimus 1) tunnetaan järjestely, jossa kannettavan tietokoneen ja siihen liitetetyn PCMCIA-kortin tehonkulutusta rajoitetaan arvoon, jolla saadaan ulostuloteho, joka on kahden standardiulostulotehon arvon välissä. Koska patenttivaatimuksissa 1, 9, 16 ja 20 esitetty järjestely on näin ollen olennaisilta osiltaan ennestään tunnettu julkaisusta WO-02/07494, ei patenttivaatimuksia voida hyväksyä (PL 2 §). Muissa vaatimuksissa on esitetty teknisiä ratkaisuja, jotka ovat sinänsä tunnettuja esimerkiksi US-patenttijulkaisuista 5606704 (G06F 1/32, Pierce et. al., 25.2.97), 5613130 (G06F 1/26, Teng et al., 18.3.97) ja 5737616 (G06F 1/26, Watanabe, 7.4.98).

Ruotsinkielinen tiivistelmä puuttuu.

Lausumanne huomautusten johdosta on annettava viimeistään yllämainittuna määräpäivänä. Jollette ole antanut lausumaanne virastoon viimeistään mainittuna määräpäivänä tai ryhtynyt toimenpiteisiin tässä välipäätöksessä esitettyjen puutteellisuuksien korjaamiseksi, jätetään hakemus sillensä (patenttilain 15 S). Sillensä jätetty hakemus otetaan uudelleen käsiteltäväksi, jos Te neljän kuukauden kuluessa määräpäivästä annatte lausumanne tai ryhdytte toimenpiteisiin-esitettyjen puutteellisuuksien korjaamiseksi ja samassa ajassa suoritatte vahvistetun uudelleenkäsittelymaksun. Jos lausumanne on annettu virastoon oikeassa ajassa, mutta esitettyjä puutteellisuuksia ei ole siten korjattu, että hakemus voitaisiin hyväksyä, se hylätään, mikäli virastolla ei ole aihetta antaa Teille uutta välipäätöstä (patenttilain 16 S). Uusi keksinnön selitys, siihen tehdyt lisäykset ja uudet patenttivaatimukset on aina jätettävä kahtena kappaleena ja tällöin on otettava huomioon patenttiasetuksen 19 S.

Maksu perustuu kauppa- ja teollisuusministeriön antamaan asetukseen 1027/2001 Patentti- ja rekisterihallituksen maksullisista suoritteista muutoksineen.

Menetelmä ja järjestelmä lehonkulutuksen määrittämiseksi elektroniikkalaitteen yhteydessä ja elektroniikkalaite

5 Nyl esillä oleva keksintö kohdistuu menetelmään tehonkulutuksen määrittämiseksi elektroniikkalaitteessa, johon liitetään oheislaite, jolle leho syötetään elektroniikkalaitteesta. Keksintö kohdistuu lisäksi järjestelmään, joka käsittää elektroniikkalaitteen, jossa on välineet oheislailleen liittämiseksi ja välineet tehon syöttämiseksi oheislaitteelle, ja joka järjestelmä käsittää välineet tehonkulutuksen määrittämiseksi. Keksintö kohdistuu vielä elektroniikkalaitteeseen, jossa on välineet oheislaitteen liittämiseksi, välineet tehon syöttämiseksi oheislaitteelle, ja välineet oheislaitteen tehonkulutuksen määrittämiseksi. Keksintö kohdistuu vielä oheislaitteeseen, jossa on välineet oheislaitteelle, ja välineet oheislaitteeseen, jossa on välineet oheislaitteen liittätiseksi elektroniikkalaitteeseen, jossa on välineet oheislaitteen liittämiseksi elektroniikkalaitteeseen, jossa on välineet oheislaitteen liittävittava teho on järjestetty syötettäväksi oheislaitteelle.

Nykyisin käytössä on uselta sellaisia elektronlikkalaittelta, jolhin voldaan liittää erilaisia oheislaitteita mm. elektroniikkalaitteen ominaisuukslen laajentamiseksi ja lisätoimintojen alkaansaamiseksi. Esimerkiksi kannettaviin tietokoneisiin voidaan liittää oheislaitteita, kuten liitäntä-kortteja (esim. PCMCIA-kortteja), jollia kannettava tietokone on ilitettä-vissä lähiverkkoon, langalliseen tai langattomaan puholinverkkoon, jne. Lisäksi oheislaitteiden avulla voidaan kannettavan tietokoneen mulstla laajentaa, liittää ulkoinen kiintolevy, CDROM-asema tai vastaava.

MultiMediaCard<sup>™</sup> Association on mm. kehittämässä standardia lisämuistikortteja varten (MultiMediaCard<sup>™</sup>; MultiMediaCard<sup>™</sup> on Infineon Technologies AG:n tavaramerkki). Tällaisia lisämuistikortteja voidaan käyttää erilaisissa kannettavissa elektroniikkalaitteissa, kuten langattomissa viestimissä ja kommunikaattori-tyyppisissä laitteissa muistimäärän lisäämiseksi.

Oheislaitteiden liitettävyys erilaisiin laitteisiin aiheuttaa mm. sen, että oheislaitteen tehonkulutus ei saisi ylittää elektroniikkalaitteesta oheislaittoollo syötettävissä olevaa maksimitehoa. Muussa tapauksessa oheislaitteen ja/tal elektroniikkalaitteen toiminta saattaa häiriintyä ja

KENELLEPATREK Asiakaspalval SIVU 002

441 843 844 844 7

2

elektronlikkalaite voi jopa ylikuumentua. Toisaalta eri oheislaitteiden tchonkulutusvaatimukset voivat olla hyvinkin erilaiset, jolloin elektronlikkalaitteiden valmistajien lulisi varautua oheislaiteliitännän tehonsyötössä mahdollisimman suureen tehonkulutukseen. Tunnetaankin ratkaisuja, kuten Nokia Communicator 9110/9210, joissa elektroniik-5 kalaitteen oheislaiteliitännän tehonsyöttö on järjestetty suhteellisen tehokkaalla regulaattorilla, esim. luokkaa 150 mA/3 V. Tällainen tehokas regulaattori on suhteellisen tilaa vievä komponentti, mikä erityisesti kannettavissa elektroniikkalaitteissa voi aiheuttaa sijoitteluongelmia. Mahdollisimman suureen tehonkulutukseen varautuminen on sellaisten 10 elektroniikkalaitteiden osalta tarpeetonta, joiden käyttäjä ei käytä elektroniikkalaitteen yhteydessä sellaista oheislaitetta, jonka tehonkulutus on lähellä elektroniikkalaitteelle suunniteltua oheislaitteen maksimitehonkulutusta. Loisaalta joku toinen käyttäjä saattaa käyttää samanlaisessa elektroniikkalaitteessa sellaista oheislaitetta, jonka tehonkulutus 15 on elektroniikkalaitteelle suunniteltua oheislaitteen maksimitehonkulutuksen suuruusluokkaa.

Joissakin elektroniikkalaitteissa ja niihin liitettävissä oheislaitteissa suoritetaan käyttöjännitteen valinta siinä vaiheessa kun ohelslalte käynnistetään, esim. käynnistettäessä elektroniikkalaite tai oheislaitteen liittämisen yhteydessä. Tällöin elektroniikkalaitteen ja ohelslaltteen välillä suoritotaan signalointia, jonka porusteella elektroniikkalaite päättolee ohelslaltteen tarvitseman käyttöjännitteen suuruuden ja valitsee oheislaitteen käyttöjännitelinjaan (-linjoihin) oheislaitteelle sopivan käyllöjännilleen.

Mainitussa MultiMediaCard Association –järjestössä on ehdotettu maksimirajan asettamista MultiMediaCard<sup>™</sup>-tyyppisten muistikorttien tehonkulutukselle. Tällöin tätä standardia tukevissa elektroniikkalaitteissa varaudutaan siihen, että oheislaitteeseen voidaan syöttää määritetty maksimiteho. Lisäksi MultiMediaCard<sup>™</sup>-tyyppisten muistikorttien tehonkulutus ei tällöin saisi olla suurempi kuin määritetty maksimiraja. Tällainen järjestely on hankala mm. siitä syystä, että kehitettävien uusisien muistikorttien tehonkulutus on rajoitettu tahán maksimiarvoon, joten se voi olla esteenä sellaisten muistikorttien toteuttamiselle, joiden tehonkulutusta ei voida saada valittua maksimirajaa pienemmäksi. Mi-

KENELLEPATREK Asiakaspalvel SIVU 003

SANDISK Exhibit 1004, Page 96 of 385

käli maksimiraja asetetaan niin korkeaksi, että suurella todennäköisyydellä myös myöhemmin kehitettävien muistikorttlen tehonkulutus on lälä pienempi, merkitsee se sitä, että elektroniikkalaitteissa on käytettävä suhteellisen tehokkaita ja kookkaita regulaattoreita.

5

10

Oheislaitteen tehonkulutus on yleensä verrannollinen oheislaitteessa käytettävään kellotaajuuteen, joten kellotaajuuden kasvattaminen nostaa tehonkulutusta. Vastaavasti tehonkulutuksen pienentämiseksi voldaan oheislaitteen kellotaajuutta pienentää, mikäli se oheislaitteen muun toiminnan kannalta on mahdoillista. Tällöin kuitenkin oheislaitteen toimintanopeus pienenee, mikä ei välttämättä ole toivottavaa. Myös oheislaitteessa käytössä olevalla väyläleveydellä on vaikutusta siihen, kuinka paljon tehoa oheislaitteessa kuluu.

15 Nyt esillä olevan keksinnön eräänä tarkoituksena on aikaansaada parannettu menetelmä ja järjestelmä tehonkulutuksen määrillämiseksi kulloiseenkin tilanteeseen sopivaksi. Lisäksi keksinnön tarkoituksena on aikaansaada elektroniikkalaite ja oheislaite, joissa menetelmää sovolletaan. Keksintö perustuu siihen ajatukseen, että määritetään tehonkulutukselle ainakin ensimmäinen ja toinen maksimiarvo, jolloin 20 elektroniikkalaite ja oheislaite suorittavat tehonkulutuksen asettamisen johonkin arvoon näiden ensimmäisen ja loisen maksimiarvon välissä. Tällöin esimerkiksi oheislaite voi erilaisissa toimintatilanteissa säätää tehonkulutustaan tilanteeseen sopivaksi. Nyt esillä olevan keksinnön 25 mukaiselle menetelmälle on pääasiassa tunnusomaista se, että määritetään tehonkulutukselle ainakin ensimmäinen maksimiarvo ja ensimmäistä maksimiarvoa suurempi toinen maksimiarvo, ja että elektroniikkalaitteen ja oheislaitteen välillä suoritetaan oheislaitteen tehonkulutuksen maksimin asettaminen arvoon, joka on olennaisesti 30 mainittujen ensimmäisen ja toisen maksimiarvon välissä. Keksinnön mukalselle järjestelmälle on pääasiassa tunnusomaista se, että tehonkulutukselle on määritetty ainakin ensimmäinen maksimiarvo ja ensimmäistä maksimiarvoa suurempi toinen maksimiarvo, ja että välineet tehonkulutuksen määrittämiseksi käsittävät välineet oheislaitteen te-35 honkulutuksen maksimin asettamisen arvoon, joka on mainittujen ensimmäisen maksimiarvon ja toisen maksimiarvon välissä. Keksinnön mukaiselle elektroniikkalaitteelle on pääasiassa lunnusomaista se, että

KENELLEPATREK Asiakaspalvel SIVU 004

9004

4

tehonkulutukselle on määritetty ainakin ensimmäinen maksimiarvo ja ensimmäistä maksimiarvoa suurempi toinen maksimiarvo, ja että välineet tehonkulutuksen määrittämiseksi käsittävät välineet oheislaitteen tehonkulutuksen maksimin asettamisen arvoon, joka on mainittujen ensimmäisen maksimiarvon ja toisen maksimiarvon välissä. Keksinnön mukaiselle oheislaitteelle on vielä pääasiassa tunnusomaista se, että tehonkulutukselle on määritetty ainakin ensimmäinen maksimiarvo ja ensimmäistä maksimiarvoa suurempi toinen maksimiarvo, ja että välineet tehonkulutuksen määrittämiseksi käsittävät välineet oheislaitteen tehonkulutuksen maksimin asettamisen arvoon, joka on mainittujen 10 ensimmäisen maksimiarvon ja toisen maksimiarvon välissä.

Nyt esillä olevalla keksinnöllä saavutetaan merkittäviä etuja tunnetun tekniikan mukaisiin ratkaisuihin verrattuna. Keksinnön mukalsella menetelmällä voidaan elektroniikkalaitteessa välttyä tarpoottoman suuron 15 regulaattorin käyttämiseltä, mikä säästää kustannuksia, ja jolloin elektroniikkalaitteen kokoa voidaan joissakin tapauksissa pienentää ja toisaalta suuren tehonkulutuksen alheuttamilta lämpenemisongelmilta välttyä. Myös virrankulutusta voidaan pienentää, mistä on etua erityisesti kannettavissa laitteissa. Keksinnöllä voidaan oheislaiteliitäntään 20 aikaansaada myös joustavuutta, koska oheislaitteen tehonkulutusta voidaan säätää ja asettaa se kulloisenkin käyttötilanteen kannalta sopivaan arvoon. Myös oheislaitteen kellotaajuutta ja väyläleveyttä voidaan keksinnön erään edullisen suoritusmuodon mukaisessa järjestelmässä muuttaa. Keksintö mahdollistaa vielä sen, että kehitettävät uudet 25 oheislaitteet toimivat aikaisemmin valmistetlujen elektroniikkalaitteiden yhteydessä ja olemassa olevat oheislaitteet toimivat kehitettävien uusien elektroniikkalaitteiden yhteydessä. Keksinnön mukaisella ratkaisulla voidaan myös saada parannusta elektroniikkalaitteen käyttäjäystävälli-30 syyteen mm. tilanteessa, jossa oheislaite ei voi toimia täysin alemmalla tehonkulutustasolla, mutta voi kuitenkin antaa tästä informaation elektroniikkalaitteelle. Tällöin elektroniikkalaite voi huolehtia oheislaitteen alasajosta (sammuttamisesta) asianmukaisesti ja muodostaa tästä ilmoituksen käyttäjälle.

35

Keksintöä selostetaan seuraavassa tarkommin viitaton samalla ohoisiin piirustuksiin, joissa

- kuva 1 esittää keksinnön eraan edullisen suoritusmuodon mukaista järjestelmää pelkistettynä lohkokaaviona,
- 5 kuva 2 esittää keksinnön erään toisen edullisen suoritusmuodon mukaista järjestelmää pelkistetysti,
  - kuva 3 esittää pelkistetysti keksinnön eraan edullisen suoritusmuodon mukaisessa menetelmässä suoritettavaa signalointia, ja
  - kuva 4 esittää pelkistetysti keksinnön vielä erään eduilisen suoritusmuodon mukaista oheislaitetta polkistottynä lohkokaaviona.

Kuvan 1 mukalsessa keksinnön edullisen suoritusmuodon mukaisessa järjostelmässä käytetään esimerkkinä elektroniikkalaitteesta 1 langatonla vieslintätaitella. Oheislailleena 2 on lässä esimerkissä muistikortti, kuten MultiMediaCard™-standardin mukainen muistikortti. On kuitenkin selvää, että nyt esillä olevaa keksintöä ei ole rajoitettu aino-20 astaan tällaisiin elektroniikkalaitteisiin ja oheislaitteisiin, vaan keksintöä voidaan sovellaa myös muiden elektroniikkalaitteiden sekä oheislaitteiden yhtevdessä. Oheislaite 2 voi olla esimerkiksi liitäntäkortti tai myös jokin muu laite. Elektroniikkalaite 1 käsittää ohjauslohkon 3, jossa on 25 yksi tai useampi suoritin, kuten mikro-ohjain (MCU). Lisäksi elektroniikkalaite 1 käsittää muistia 4, käyttöliittymän 5 sekä välineet 6 matkaviestintoimintojen suorittamiseksi, kuten GSM- ja/tai UMIS-matkaviestinvälineet. Käyttöliittymä 5 käsittää edullisesti näytön, näppäimistön ja audiovalineet sinansa tunnetusti. Oheislaitteen 2 liittämiseksi on elekt-30 roniikkalaitteeseen 1 muodostettu liitäntävälineet 7, jotka käsittävät ainakin yhden liittimen 8 sekä tarvittavat I/O-lohkot 9 mm. oheislaitteen 2 ja elektroniikkalaitteen 1 väylien kytkemiseksi toisiinsa.

35

Ohoislaittoossa on myös vastaavat liitäntävälineet 10, jolla oheislaite 2 liitetään elektroniikkalaitteen 1 yhteyteen. Oheislaitteen liitäntävälineet 10 käsittävät ainakin yhden liittimen 11, joka on yhdistettävissä elektroniikkalaitteen 1 liittimeen 8 ja I/O-lohko 12. Tehonsyöttö oheislaitteelle

KENELLEPATREK Asiakaspalvel SIVU 006

SANDISK Exhibit 1004, Page 99 of 385

6

2 järjestetään elektroniikkalaitteesta 1 liittimien 8, 11 kautta. I/O-lohkojen kautta suoritetaan elektroniikkalaitteen 1 ja oheislaitteen 2 vällnen kommunikointi. Tämä voidaan suorittaa rinnakkaismuotoisena tiedonsiirtona tai sarjamuotoisena tiedonsiirtona. Esimerkiksi malnitussa MultiMediaCard™-määritysten mukaisessa oheislaitteessa käytetään sarjamuotoista tiedonsiirtoa. Nyt esillä olevan keksinnön kannalta ei kuitenkaan ole merkitystä sillä, missä muodossa tiedonsiirto elektroniikkalaitteen 1 ja oheislaitteen 2 välillä toteutetaan.

Oheislaitteessa 2 on myös suoritin 13 tal vastaava oheislaitteen 2 toimintojen ohjaamiseksi. Oheislaite käsittää myös muistia 14, kuten luku/kirjoitusmuistia (RAM) mm. tietojen tallentamiseksi, sekä lukumuistia (ROM, NVRAM) suorittimen ohjelmakoodin tallennusta varten. Suoritin huolehtii mm. I/O-lohkojen ohjaamiseksi tiedonsiirrossa oheislaitteen 2 ja eloktroniikkalaitteen 1 välillä. Oheislaitteen muistiin 14 on tallennettu myös alnakin tehonkulutuksen ensimmäinen maksimiarvo sekä toinen maksimiarvo, joita käytetään nyt esillä olevan keksinnön mukaisessa menetelmässä. Lisäksi oheislaite käsittää välineet suorittimen toiminnassa tarvittavan yhden tai useamman kellosignaalin muodostamiseksi, kuten kellogeneraattorin 16.

Seuraavaksi selostetaan keksinnön erään edullisen suoritusmuodon mukaisen menetelmän toimintaa kuvan 1 mukaisessa järjestelmässä. I/O-lohkojen kautta välitetään elektroniikkalaitteelle 1 mm. tieto siitä, 25 onko elektroniikkalaitteen liitäntävälineiden liittimeen 8 asetettu oheislaitetta 2. Tämä voidaan toteuttaa esimerkiksi siten, että I/O-lohkossa 9, 12 on tunnistuslinja 15, jonka tila muuttuu, kun oheislaite 2 asetetaan liittimeen 8. Tunnistuslinja 15 on toteutettu keksinnön tässä edullisessa suoritusmuodossa siten, että tunnistuslinja 15 on elektroniikka-30 laitteessa 1 asetettu loogiseen 1-tilaan ylösvetovastuksella R. Tilanmuutos aikaansaadaan kuvan 1 mukaisessa järjestelmassa siten, että oheislaite 2 maadoittaa tunnistuslinjan 15, jolloin tunnistuslinjan 15 tila muuttuu loogiseksi 0-tilaksi. Tämä tilanmuutos havaitaan elektroniikkalaitteessa 1 esimerkiksi siten, että tilanmuutos aiheuttaa keskeytyk-35 sen ohjauslohkossa 3, jolloin suoritetaan vastaava keskeytyspalveluohjelma ja aloitetaan oheislaitteen alustustoimintojen suorittaminen. Sen jälkeen kun oheislaitteelle on kytketty käyttöjännitteet, aloittaa

KENELLEPATREK Asiakaspalvel SIVU 007

SANDISK Exhibit 1004, Page 100 of 385

7

oheislaitteen 2 suoritin 13 omien alustustoimintojensa suorittamisen. Oheislaitteen 2 tehonkulutus mm. asetetaan olelusarvoonsa, joka tāssā edullisessa suoritusmuodossa on ensimmäison maksimirajan mukainen tehonkulutusarvo. Tässä oletetaan, että ensimmäinen maksimiraja on pienempi kuin toinon maksimiraja. Suoritin asettaa myös kellogeneraattorin 16 taajuuden vastaamaan tätä tehonkulutusarvoa. Tyypillisesti kellogeneraattorin taajuus asetetaan minimiarvoon. Kaikissa ohelslaittelssa 2 ei väittämättä ole mahdollista säätää kellogeneraattorin 16 taajuutta, jolloin kellogeneraattoria 16 ei voida käyttää te-10 honkulutuksen säälämisessä.

Elektroniikkalailleen 1 suorillamissa oheislailleen alustustoiminnoissa tutkitaan edullisesti oheislaitteen 2 tyyppi, mikä voi vaikuttaa siihen, minkälaisia alustustoimintoja suoritetaan. Tässä selityksessä rajoitu-15 taan kuitenkin vain keksinnön kannalta olennaisten toimintojen kuvaamiseen. Keksinnön tämän edullisen suoritusmuodon mukaisessa menetelmässä suoritettavaa signalointia on kuvattu pelkistetysti oheisessa kuvassa 3. Sen jälkeen kun oheislaitteen 2 tyyppi on selvitetty, aloitetaan kortille tallennettujen tehonkulutuksen ensimmäisen ja toisen 20 maksimirajan selvittäminen. Tällöin elektroniikkalaitteesta 1 lähetetään edullisesti maksimirajojen lukusanoma oheislaitteelle 2. Tätä esittaa nuoli 301 kuvan 3 kaaviossa. Oheislaitteessa 2 vastaanotetaan sanoma ja tutkitaan sen sisältö edullisesti suorittimessa 13. Sanoman perusteella suoritin 13 lukee muistista 14 ensimmäisen maksimirajan ja 25 toisen maksimirajan (lohko 302 kuvassa 3). Mikäli maksimirajoja on useampia kuin 2, on muistivälineisiin edullisesti tallennettu tieto maksimirajojen lukumäärästä, jolloin suoritin 13 lukee kaikkien maksimirajojen arvot muistista 14. Tämän jälkeen suoritin 13 muodostaa vastaussanoman (lohko 303), joka sisältää kysytyt tiedot, kuten ensimmäi-30 sen ja toisen maksimirajan ja tarvittaessa myös tiedon maksimirajojen lukumäärästä. Useampien maksimirajojen tapauksessa sanomaan edullisesti liitetään muidenkin maksimirajojen arvot. Sanoma lähete lään I/O-lohkojen 9, 12 kautta elektroniikkalaitteelle (nuoli 304), jossa ohjauslohko lukee vastaanotetun sanoman tiedot ja tarvittaessa tallentaa ne elektroniikkalaitteen muistiin 4.

35

VAST.OTTO 27-03-02 16:09 MISTA- 03 2886262 KENELLEPATREK Asiakaspalvel SIVU 008

Sen jälkeen kun elektroniikkalaitteessa 1 on tiedossa oheislaitteen tukemat tehonkulutuksen maksimirajat, voidaan alolttaa oheislaitteen tehonkulutuksen säätäminen tarvittaessa. Oletetaan, että cloktroniikkalaite 1 pystyy syöttämään oheislaitteelle 2 tolsta maksimirajaa vastaavan tehon. Tällöin elektroniikkalaitteesta 1 lähototään tehonsäätösa-5 noma oheislaitteelle 2 (nuoli 305). Tässä tehonsäätösanomassa ilmoitetaan se tehonkulutusarvo, joka halutaan asettaa oheislaitteen 2 maksimiarvoksi, esimerkiksi mainittu toinen maksimiraja. Ohelslaltteen suoritin 13 tutkii vastaanotetun sanoman tyypin, ja havaittuaan kyseessä olevan tehonsäätösanoma, lukee sanomassa ilmoitetun lehonkululuk-10 sen maksimiarvon (lohko 306). Tämän jälkeen oheislaitteen suoritin 13 asettaa esimerkiksi kellogeneraattorin 16 toiminlalaajuuden arvoon, joka vastaa tätä tchonkulutuksen maksimiarvoa, esimerkiksi suurimpaan mahdolliseen taajuuteen. Myös suorittimen sisäisiä väyläleveyksiä voidaan joissakin sovelluksissa muuttaa sen mukaan, minkälainen 15

- tehonkulutuksen maksimiraja on käytössä. Oheislaite 2 edullisesli ilmoittaa vielä elektroniikkalaitteelle 1, että tehonkulutus on rajoitettu pyydettyyn arvoon (nuoli 307).
- Mikäli elektroniikkalaite 1 ei pysty tuottamaan oheislaitteelle 2 toisen 20 maksimirajan mukaista tehoa, tai muusta syystä elektroniikkalaite 1 pyrkii asettamaan tehonkulutuksen maksimiarvon pienemmäksi kuin toinen maksimiraja, voidaan suorittaa signalointi, jolla elektronlikkalaite 1 ja oheislaite pyrkivät löytämään tilanteeseen sopivan tehonkulutuksen maksimirajan. I ämä voidaan toteuttaa esimerkiksi siten, että elekt-25 roniikkalaite 1 valitsee ensimmäisen ja toisen maksimirajan välistä sellaisen arvon, joka elektroniikkalaitteen 1 kannalta on maksimiarvo. Tieto tästä rajasta välitetään oheislaitteelle 2, jossa tutkitaan 13 ehdotettu arvo, ja jos se voidaan hyväksyä, välitetään siitä tieto elektroniikkalaitteelle 1. Jos oheislaite 2 ei voi asettaa omaa tehonkulutustaan 30 sellaiseksi, joka vastaa ehdotettua maksimiarvoa, ehdottaa ohelslaite 2 jotakin pienempää arvoa ensimmäisen ja toisen maksimiarvon välistä. Jos tämä arvo on elektroniikkalaitteen 1 kannalta mahdollinen, ilmoittaa clektroniikkalaite 1 tästä oheislaitteelle 2, jolla tehonkulutus asetetaan tähän arvoon. Mikäli oheislaitteen 2 ehdottama arvo ei ole sopiva, va-35 litaan edullisesti elektroniikkalaitteessa 1 jokin muu, sopivimmin pienempi arvo, joka kuitenkin on vähintään yhtä suuri kuin ensimmäinen

VAST.OTTO 27-03-02 16:09 MISTA- 03 2886262

SIVU 008 KENELLEPATREK Asiakaspalvel

9

maksimiraja, ja ilmoitetaan se oheislaitteelle 2. Edellä esitettyjä vaiheita toistetaan, kunnes on löydetty sellainen tehonkulutusarvo, joka sopii elektroniikkalaitteelle 1 ja oheislaitteelle 2. Joissakin tapauksissa saattaa käydä niin, että ainoa sopiva arvo on ensimmäinen maksimiarvo, jolloin tehonkulutusta ei tarvitse säätää, koska tämä arvo on oletusarvona.

Tehonkulutuksen arvoa voi olla tarve muuttaa myös elektroniikkalaitteen 1 ja siihen liitetyn oheislaitteen 2 toiminnan aikana. Esimerkiksi, jos ohelslaitteena on lähetin/vastaanotinkortti, kuten matkaviestinkortti 10 tai modeemikortti, saattaa oheislaitteen 2 tehonkulutusrajaa olla tarve muuttua merkittävästi esimerkiksi lähetyksen ajaksi. Tällöin silnä vaiheessa kun esim. oheislaite 2 havaitsee tarpeen muuttaa tohonkulutusta, lähettää se sanoman elektroniikkalaitteelle 1 ja ehdottaa uutta tehonkulutusarvoa, joka kuitenkin on ensimmäisen ja toisen maksimi-15 arvon välissä. Elektroniikkalaitteen 1 ja oheislaitteen 2 välillä suoritetaan sanomien vaihtoa esim. edellä kuvattuja periaatteita soveltaen oheislaitteen tehonkulutuksen säätämiseksi tarvetta vastaavaksi. Tehonkulutustarpeen jälleen muuttuessa voidaan suorittaa uusi tehonku-20 lutuksen säätö.

Oheislaitteen tehonkulutuksen muuttamistarve voi syntyä myös elektroniikkalaitteessa 1. Esimerkiksi elektroniikkalaitteen 1 toiminnan siirtyessä tehonsäästötilaan, tai elektroniikkalaitteen 1 akun (ei esitetty) varauksen pienentyessä, voi elektroniikkalaite 1 ohjata oheislaitetta 2 siirtymään vähemmän tehoa kuluttavaan tilaan.

Keksinnön mukainen oheislaite voidaan liittää myös sellaiseen elektroniikkalaitteeseen 1, jossa ei ole mahdollisuutta säätää tehonkulutusta. Tällöin tehonkulutusarvoksi asetetaan oheislaitteessa 2 oletusarvo, sils soplvimmin ensimmäinen maksimiraja. Keksinnön mukainen oheislaite voidaan siis liittää sellaiseenkin elektroniikkalaitteeseen 1, jossa ei ole toteutettu keksinnön mukaisen menetelmän vaiheita oheislaitteen 2 tohonkulutuksen säätämiseksi.

35

25

ڊ . م

Edellä oli mainittu useamman kuin kahden eri maksimirajan käyttäminen tehonkulutuksen maksimiarvoina. Tässä oletetaan, että muut mak-

→ PRH

TAMPEREEN PATENT

simirajat ovat ensimmäisen ja toisen maksimirajan välissä. Nämä erilaiset maksimirajat voivat tulla kyseeseen esimerkiksi sellaisissa sovelluksissa, joissa oheislaitteessa on mahdollista valita erilaisia väyläleveyksiä. Esimerkiksi kuvan 2 mukaisessa järjestelmässä on oheislaitteen ja elektroniikkalaitteen välisen liitännän väyläleveys valittavissa 5 joksikin kolmesta arvosta: 8, 16 tai 32 blttlä. Samalla tärnä liilännälle valittu väyläleveys tulee tässä edullisessa suoritusmuodossa käyttöön myös oheislaitteen 2 sisäisessä väylässä 17. Tyypillisesti tehonkulutus on sitä suurempi mitä leveämpää väylää käytetään. Tällöin oletuksena on sopivimmin se, että käynnistysvaiheessa väyläleveys on 8 bittiä, 10 mutta elektroniikkalaite 1 ja oheislaite 2 voivat neuvotella muun väyläleveyden käyttämisestä, siis tehonkulutuksen maksimirajan muuttamisesta. Tämä voidaan toteuttaa edellä esitettyjä periaatteita soveltamalla. On kuitenkin selvää, ellä mainitut väyläleveydet ovat vain eräitä ei rajoittavia esimerkkejä väyläleveyksistä. 15

Oheislaitteen kellogeneraattorin 16 taajuus ei välttämättä ole portaattomasti säädettävissä, vaan taajuudelle voidaan valita jokin arvo joistakin määrätyistä arvoista. Näitä eri taajuuksia vastaavat tehonkulutuksen maksimirajat voidaan tällöin tallentaa oheislaitteelle mainituiksi maksimirajoiksi, tai mikäli tallennetaan vain ensimmäinen maksimiraja (pienin tehonkulutus) ja toinen maksimiraja (suurin tehonkulutus), voidaan elektroniikkalaitteen 1 ja oheislaitteen välillä suorittaa aikaisemmin tässä selityksessä esitetty sanomien vaihto sopivan tehonkulutusrajan säätämiseksi.

Oheislaitteen 2 tehonkulutusta voidaan siis säätää mm. kellotaajuutta ja/tai väyläleveyttä muuttamalla, mutta on selvää, että muitakin tehonkulutuksen säätökeinoja tunnetaan ja joita keksinnön yhteydessä voidaan soveltaa. Myös käyttöjännitteen säätämisellä voidaan tehonkulutusta säätää, mikäli oheislaitteen 2 käyttöjännitteen ei tarvitse olla tietty vakioarvo. Tunnetaan oheislaitteita, joissa käyttöjännitteeksi voidaan valita esimerkiksi joko 3 V, 3,3 V, tai 5 V. Vielä eräänä esimerkkinä oheislaitteen tehonkulutuksen säätämismahdollisuuksista mainittakoon tässä yhteydessä oheislaitteen virrankulutuksen säätäminen.

Keksinnön eräässä edullisessa suoritusmuodossa on ainakin osa oheislaitteen 2 muistista jaettu kahteen tai useampaan mulstilohkoon ns. muistipankkien muodostamiseksi. Tällöin oheislaitteessa voidaan näistä muistilohkoista valita käyttöön yksi tai useampi mm. sen perusleella, mikä on oheislaitteelle 2 määritetty maksimitehonkulutusarvo. Suuremmilla tehonkulutusarvoilla voidaan tyypillisesti ottaa käyttöön useampja muistilohkoja kuin pienemmillä tehonkulutusarvoilla. Kuvassa 4 on esitetty eräs esimerkki tällaisen oheislaitteen rakenteesta. Kuvassa 4 esitetyssä oheislaitteessa 2 muistiin 14 on muodostettu neljä muistilohkoa 14a, 14b, 14c, 14d, mutta on selvää, että käytännön sovelluksissa muistipankkien lukumäärä voi olla keksinnön puitteissa myös muu kuin neljä. Muistilohkojen 14a-14d käyttöön ottamiseksi ja käytöstä poistamiseksi on edullisesti suorittimesta 13 muodostettu kytkentälinjat 18a-18d, joilla voidaan esim. kytkeä käyttöjännite haluttulhin muistilohkoihin 14a-14d, tai kytkentälinjoilla ohjataan kukin muis-

15 tilohko 14a-14d joko aktiiviseen tilaan tal tehonsäästötilaan. Myös edellä esitetyllä menetelmällä voidaan oheislaitteen 2 tehonkulutusta säätää aikaisemmin tässä selityksessä esitettyjen tehonkululuksen säätömenetelmien sijasta tai niiden lisäksi.

5

10

Elektroniikkalaitteessa 1 tehonsäätö voidaan suorittaa csimorkiksi siten, että elektroniikkalaitteessa 1 on teholähde, jonka lähtöjännitettä voidaan muuttaa. Tällöin elektroniikkalaitteessa 1 valitaan oheislaitteelle johdettavaksi käyttöjännitteeksi kulloistakin lehonkululusla vastaava jännitearvo.

Keksinnön mukaista menetelmää voidaan soveltaa myös esimerkiksi erilaisten sisältöjen toteuttamisessa elektroniikkalaitteiden 1 yhteydessä käytettäväksi esim, seuraavasti. Oheislaitteena 2 voidaan käyttää muistikorttia, kuten MultiMediaCard<sup>™</sup>-standardin määritysten mukaista korttia, johon sisältöjä voidaan tallentaa. Sisällöillä tässä yhteydessä tarkoitetaan tietojoukkoja, sovellusohjelmia, elektronisia kirjoja, audiovisualista informaatiota, kuten musiikkia, videoita, jne. Fsimerkiksi sisällön tuottaja tallentaa tällaisia sisältöjä muistikortille. Tällöin muistikortti 2 liitetään elektroniikkalaitteeseen, jossa on välineet sisällön siirtämiseksi muistikortille 2. Tällöin ennen tallennuksen aloittamista elektronlikkalaite ja muistikortti 2 suorittavat muistikortin tehonkulutuksen

KENELLEPATREK Asiakaspalvel SIVU 012

10

12

asettamiseksi edullisesti toista maksimirajaa vastaavaan arvoon. Tämä on mahdollista, koska tällaisessa sisällön tallentamisessa käylellävässä elektroniikkalaitteessa 1 ei muistikortin tehonkulutuksella ole juurikaan merkitystä, vaan elektroniikkalalte 1 voi tuottaa riillävän lehon muistikortille 2. Tallennus voidaan tällöin suorittaa mahdollisimman suurella nopeudella, koska muistikortin kellotaajuus ja/tai väyläleveys saadaan asetettua suurimmaksi mahdolliseksi. Myös muistikortille 2 tallennetun sisallön varmistaminen mahdollisten tallennusvirheiden havaitsemiseksi voidaan myös suorittaa suurimmalla mahdollisella nopeudella. Suuri tallennus- ja/tai tarkistusnopeus aikaansaa sen, että elektroniikkalaitteella 1 saadaan sisältöjon tuotantonopeutta kasvatettua verrattuna tunnetun tekniikan mukaisiin menetelmiin.

Vastaavasti siinä vaiheessa kun muistikortille 2 tallennettua sisältöä
halutaan käyttää jossakin elektroniikkalaitteessa 1, voidaan muistikortille 2 tehonkulutus asettaa sellaiseksi, joka elektroniikkalaitteen 1 kannalta on sopiva, esimerkiksi alin mahdollinen tehonkulutus. Tällöin keksinnön mukaista menetelmää sovellettaessa ei sisältöjen tuotantonopeutta tarvitse rajoittaa sen mukaan, mikä on sisällön käyttämisessä
20 mahdollinen maksimi tehonkulutusarvo.

Koska keksinnön mukaisella menetelmällä voidaan suorittaa oheislaitteen tehonsäätö, voidaan oheislaite 2 liittää useisiin erilaisiin elektroniikkalaitteisiin. Joissakin elektroniikkalaitteissa on oheislaitteelle syötettävissä vain minimitehonkulutusta vastaava teho (jannite ja virta), 25 iolloin elektroniikkalaitteessa 1 ei tarvita suurikokoista regulaattoria ja elektroniikkalaitteen kokoa ei tarvitse kasvattaa suurikokoisen regulaattorin tilantarpeen johdosta. Toisaalta kehitettävissä oheislaitteissa 2 ei tarvitse rajoittaa tehonkulutusta, koska elektroniikkalaite ja oheislaite voivat neuvotella sopivan tehonkulutusarvon. Tällöin jos oheislaite lii-30 tetään sellaiseen elektronlikkalaitteeseen, jossa oheisiaitellitäntään voidaan syöttää suhteellisen suuri teho, voidaan oheislaitetta käyttää mahdollisimman tehokkaasti (suurella kellotaajuudella/väyläleveydellä). Alustusvaiheessa tällainonkin oheislaite toimii pionommällä tohonkulu tuksella, kunnes sopiva tehonkulutuksen arvo on valillu. Keksinnön 35 mukaisessa järjestelmässä voidaan varautua tulevaisuudessa kehitettävien mahdollisesti suurtakin tehoa vaativien oheislaitteiden käyttämi-

KENELLEPATREK Aciakaspalvel SIVU 013

SANDISK Exhibit 1004, Page 106 of 385

seen elektroniikkalaitteissa. Kuitenkaan oi kaikkien elektroniikkalaitteiden suunnittelussa tarvitse ottaa huomioon paljon tehoa kuluttavia kortteja.

5 On selvää, että tehonkulutuksen asettamisessa suoritettavat vaiheet voidaan toteuttaa muullakin tavalla kuln edellä esitetty sanomien muodossa tapahtuva kättely. Liitäntävälineissä 7, 10 voi olla esimerkiksi liitäntälinjoja, joita käyttämällä voldaan tehonkulutus asellaa oheislailteelle. Lisäksi keksintöä voidaan soveltaa siten, että mainituille maksimirajoille on määritelly liellyjä vaihtoehtoisia (sallittuja) arvoja, jolloin kullakin oheislaitteella on ensimmäinen maksimiraja ja toinen maksimiraja valittu näiden vaihtoehtoisien rajojen joukosta.

Lisäksi mainittakoon, että oheislaitteen 2 ei tarvitse olla korttimuotoinen oheislaite, vaan oheislaitteena 2 voidaan käyttää muutakin laitetta, joka 15 on liitettävissä elektroniikkalaitteeseen 1. Eräänä ei rajoittavana esimerkkinä tällaisesta oheislaitteesta mainittakoon kamera, joka liitetään esimerkiksi langattomaan viestimeen, tietokoneeseen, tms. Tällöin tehonkulutusta säätämällä voidaan vaikuttaa kameran toiminnallisiin ominaisuuksiin. Esimerkiksi pienemmällä tehonkulutuksella kameran 20 kuvien päivitysnopeus elektroniikkalaitteen näytöllä voi olla pienempi kuin suuremmalla tehonkulutuksella. Tällöin elektroniikkalaite 1 voi asettaa oheislaitteena 2 käytettävän kameran tehonkulutuksen edullisesti sen perusteella, kuinka suuren tehon elektroniikkalaite 1 pystyy syöttämään oheislaitteelle. Keksinnön eräässä edullisessa suoritus-25 muodossa myös cicktroniikkalaitteen 1 käyttäjä voi asettaa tohonkulutuksen maksimirajan, jolloin käyttäjä voi halutessaan esim. plenentää maksimirajaa kannettavan elektroniikkalaitteen käyttöajan pidentämi seksi.

30

On selvää, että nyt esillä olevaa keksintöä ei ole rajoitettu ainoastaan odellä ositettyihin suoritusmuotoihin, vaan sitä voidaan muunnella oheisten patenttivaatimusten puitteissa.

#### Patenttivaatimukset:

 Menetelmä tehonkulutuksen määrittämisoksi elektroniikkalaitteessa (1), johon liitetään ohelsialte (2), jolle teho syölelään elektroniikkalaitteesta (1), tunnettu siitä, että määritetään tehonkulutukselle ainakin ensimmäinen maksimiarvo ja ensimmäistä maksimiarvoa suurempi toinen maksimiarvo, ja että elektroniikkalaitteen (1) ja oheislaitteen (2) välillä suoritetaan oheislaitteen (2) tehonkulutuksen maksimin asettaminen arvoon, joka on olennaisesti mainittujen ensimmäisen ja toisen maksimiarvon välissä.

2. Patentlivaalimuksen 1 mukainen menetelmä, tunnettu siitä, että mainittua ensimmäistä maksimirajaa käytetään tehonkulutuksen olelusarvona, jolloin oheislaitteen (2) tehonkulutus asetetaan käynnistysvaiheessa korkeintaan olennaisesti samaksi kuin mainittu ensimmäinen maksimiraja.

 Patenttivaatimuksen 1 tai 2 mukainen menetelmä, tunnettu siitä, että mainittua toista maksimirajaa käytetään tehonkulutuksen suurimpana sallittuna arvona.

4. Patenttivaatimuksen 1, 2 tai 3 mukainen menetelmä, tunnettu siitä, että elektroniikkalaitteen (1) ja oheislaitteen (2) välillä siirretään sanomia oheislaitteen tehonkulutuksen asettamiseksi johonkin arvoon olennaisesti mainittujen ensimmäisen maksimirajan ja toisen maksimirajan välissä.

5. Jonkin patonttivaatimuksen 1–4 mukainen menetelmä, tunnettu siltä, että oheislaitteelle (2) tallennetaan ainakin yksi sisältö käytettäväksi elektroniikkalaitteen (1) yhteydessä, jolloin sisällön tallennusvaiheessa oheislaitleen (2) lehonkulutukseksi asetetaan mainittua toista maksimirajaa vastaava arvo, ja sisällön käyttövaiheessa oheislaitteen (2) tehonkulutukseksi asetetaan mainittua ensimmäistä maksimirajaa vastaava arvo.

35

15

20

25

30

6. Jonkin patenttivaatimuksen 1---5 mukainen menetelmä, tunnettu siitä, että oheislaitteessa (2) muodostetaan ainakin yksi kellosignaali, ja

KENELLEPATREK Asiakaspalvel SIVU 015

→ PRH

että oheislaitteen (2) tehonkulutuksen säätäminen suoritetaan mainitun alnakin yhden kellosignaalin laajuulla säätämällä.

7. Jonkin patenttivaalimuksen 1---6 mukainen menetelmä, tunnettu
 5 siitä, että oheislaitteessa (2) on ainakin yksi väylä, ja että oheislaitteen (2) tehonkulutuksen säätäminen suoritetaan oheislaitteen (2) väyläleveyttä säätämällä.

- Jonkin patenttivaatimuksen 1-7 mukainen menetelmä, tunnettu
   siitä, että oheislaitteelle (2) on muodostettu kaksi tai useampia muistilohkoja (14a—14d), jolloin oheislaitteen (2) tehonkulutuksen säätäminen suoritetaan oheislaitteen (2) olennaisesti samanaikaisesti käsittelemien muistilohkojen (14a—14d) määrää säätämällä.
- 9. Järjestelmä, joka käsittää elektroniikkalaitteen (1), jossa on välineet (7) oheislaitteen (2) liittämiseksi ja välineet (8) tehon syöttämiseksi oheislaitteelle (2), ja joka järjestelmä käsittää välineet (7, 10, 14) tehon-kulutuksen määrittämiseksi, tunnettu siitä, että tehonkulutukselle on määritetty ainakin ensimmäinen maksimiarvo ja ensimmälstä maksimiarvoa suurempi toinen maksimiarvo, ja että välineet tehonkulutuksen määrittämiseksi käsittävät välineet (3, 13, 16, 17) oheislaitteen (2) tehonkulutuksen maksimia asettamisen arvoon, joka on mainittujen ensimmälsen maksimiarvon ja toisen maksimiarvon välissä.
- 25 10. Patenttivaatimuksen 9 mukainen järjestelmä, tunnettu siitä, että se käsittää välineet (7, 10) sanomien siirtämiseksi elektroniikkalaitleen (1) ja oheislailleen (2) välillä oheislailteen lehonkululuksen aseltamiseksi johonkin arvoon olennaisesti mainittujen ensimmäisen maksimirajan ja loisen maksimirajan välissä.

30

35

11. Patenttivaatimuksen 9 tai 10 mukainen järjestelmä, tunnettu siitä, että oheislaitteessa (2) on välineet (16) ainakin yhden kellosignaalin muodostamiseksi, ja että järjestelmä käsittää välineet (7, 10, 13) oheislaitteen (2) tehonkulutuksen saatamiseksi mainitun ainakin yhden kellosignaalin taajuutta säätämällä.

SANDISK Exhibit 1004, Page 109 of 385

15

→ PRH

12. Patenttivaatimuksen 9, 10 tai 11 mukainen järjestelmä, tunnettu siitä, että oheislailleessa (2) on ainakin yksi väylä, ja että järjestelmä käsittää välineet (7, 10, 13) oheislaitteen (2) tehonkulutuksen säätämiseksi suoritetaan oheislailleen (2) väyläleveyttä säätämällä.

13. Jonkin palenttivaatimuksen 9-12 mukainen järjestelmä, tunnettu siitä, että oheislaitteelle (2) on muodostettu kaksi tai useampia muistilohkoja (14a—14d), ja että välineet (7, 10, 13) oheislaitteen (2) tehonkulutuksen säätämiseksi käsittävät välineet (13, 18a—18d) oheislaitteen (2) olennaisesti samanaikaisesti käsittelemien muistilohkojen (14a—14d) määrän säätämiseksi.

14. Jonkin patenttivaatimuksen 9----13 mukainen järjestelmä, tunnettu siitä, että elektroniikkalaite (1) on kannettava elektroniikkalaite (1).

15. Patenttivaatimuksen 14 mukainen järjestelmä, tunnettu siitä, että se käsittää välineet (6) matkaviestintoimintojen suorittamiseksi.

16. Flektroniikkalaite (1), jossa on välineet (7) ohelslaltteen (2) liittämiseksi ja välineet (8) tohon syöttämisoksi ohoislaittoollo (2), ja välineet (7) tehonkulutuksen määrittämiseksi, tunnettu siilä, ellä tehon-kulutuksollo on määritotty ainakin onsimmäinen maksimiarvo ja ensimmäislä maksimiarvoa suurempi toinen maksimiarvo, ja ellä välineet tehonkulutuksen määrittämiseksi käsittävät välineet (3) oheislaitleen (2) tehonkulutuksen maksimiarvon ja toisen maksimiarvon välissä.

17. Patenttivaatimuksen 16 mukainen elektroniikkalaite (1), tunnettu siitä, että se käsittää välineet (7) sanomien lähettämiseksi oheislait30 teelta (2) ja vastaanottamiseksi oheislaitteelta (2) oheislaitteen tehon-kulutuksen asettamiseksi johonkin arvoon olennaisesti mainittujen ensimmäisen maksimirajan ja toisen maksimirajan välissä.

18. Patenttivaatimuksen 16 tai 17 mukainen elektronlikkalaite (1),
 35 tunnettu siitä, että se on kannettava elektroniikkalaite (1).

\* \* \* \*

20

17

19. Patonttivaatimuksen 18 mukainen elektroniikkalaite (1), tunnettu siitä, että se käsittää välineel malkaviestintoimintojen suorittamiseksi.

20. Oheislaite (2), jossa on välineet (10) oheislaitteen (2) liittämiseksi elektroniikkalaitteeseen (1), josta oheislaitteen (2) käyttämisessä tarvitlava leho on järjestetty syötettäväksi oheislaitteelle (2), tunnettu siitä, että tehonkulutukselle on määritetty ainakin ensimmäinen maksimiarvo ja ensimmäistä maksimiarvoa suurempi toinen maksimiarvo, ja että oheislaite käsittää välineet (13, 16, 17) tehonkulutuksen maksimiarvon ja toisen maksimiarvon välissä.

21. Patenttivaatimuksen 20 mukainen ohelslalte (2), tunnettu siitä, että oheislaitteelle (2) on tallennettu ainakin yksi sisältö käytettäväksi
 15 elektroniikkalaitteen (1) yhteydessä.

22 Patenttivaatimuksen 20 tai 21 mukainen ohelslalte (2), tunnettu siitä, että oheislaitteessa (2) on välineet (16) ainakin yhdon kollosignaalin muodostamiseksi, ja välineet (13) oheislaltteen (2) tehonkulutuksen säätämiseksi mainitun ainakin yhdon kollosignaalin taajuutta säätämällä.

23. Patenttivaatimuksen 20, 21 tai 22 mukainen oheislaile (2), tunnettu siitä, ottä oheislaitteessa (2) on ainakin yksi väylä, ja väli25 neet (13) oheislailleen (2) lehonkulutuksen säälämiseksi oheislailteen (2) väyläleveyttä säätämällä.

24. Jonkin patenttivaatimuksen 20-23 mukainen oheislaite (2), tunnettu siitä, että oheislaitteelle (2) on muodostettu kaksi tai useam30 pia muistilohkoja (14a—14d), ja että välineet (7, 10, 13) oheislaitteen (2) tehonkulutuksen säätämiseksi käsittävät välineet (13, 18a— 18d) oheislaitteen (2) olennaisesti samanaikaisesti käsittelemien muistilohkojen (14a—14d) määrän säätämiseksi.

35 25. Jonkin patenttivaatimuksen 20-24 mukainen oheislaite (2), tunnettu siitä, että se on MultiMediaCard<sup>™</sup> -oheislaite.

### 18

### (57) Tiivistelmä

Nyt esillä oleva keksintö kohdistuu menetelmään ja järjestelmään tehonkulutuksen määrittämiseksi elektroniikkalaitteessa (1), johon liitetään oheislaite (2), jolle teho syötetään elektroniikkalaitteesta (1). Tehonkulutukselle määritetään ainakin ensimmäinen maksimiarvo ja ensimmäistä maksimiarvoa suurempi toinen maksimiarvo. Elektroniikkalaitteen (1) ja oheislaitteen (2) välillä suoritetaan oheislaitteen (2) tehonkulutuksen maksimin asottaminen arvoon, joka on olennaisesti mainittujen ensimmäisen ja toisen maksimiarvon välissä. Keksintö kohdistuu lisäksi elektroniikkalaitteeseen (1) ja oheislaitteeseen (2), joissa menetelmää sovelletaan.

#### INFORMATION\_DISCLOSURE STATEMENT

Sir:

Applicant submits herewith references of which he is aware, which he believes may be material to the examination of this application and which he may have a duty to disclose in accordance with 37 CFR 1.56.

While this Information Disclosure Statement may be "material" pursuant to 37 CFR 1.56, it is not intended to constitute an admission that any document referred to herein is "prior art" for this invention unless specifically designated as such.

FILING OF PAPERS AND FEES BY "EXPRESS MAIL" WITH CERTIFICATE IN ACCORDANCE WITH 37 CFR 1.10

I hereby certify that this correspondence is being deposited with the United States Postal Service on the date shown below with sufficient postage as "Express Mail" in an envelope with Mailing Label No. EV137073922US placed thereon prior to mailing and addressed to the U.S. Patent and Trademark Office, P.O. Box 2327, Arlington, VA 22202.

0 00

Margery B. Hood Dated: March 26, 2003

In accordance with 37 CFR 1.97(g), the filing of this Information Disclosure Statement should not be construed to mean that a search has been made or that no other material information as defined under 37 CFR 1.56(a) exists.

Enclosed is a copy of the first Official Action with its English translation together with cited references.

Also enclosed is a Form PTO-1449 listing the cited references.

Respectfully submitted,

haorne

Francis J. Maguire Attorney for the Applicant Registration No. <u>31</u>,391

02/07494 A2 (57) Abstract: A hand-held, PCMCIA cellular radio modem card is described which uses a non-standard power output level. The non-standard power output is defined as the maximum RF power attainable such that the current drawn by the power amplifier does not exceed 400 mA. This definition permits the use of the wireless modern inside hand-held computing devices without the use of an additional battery pack extension.

## PERSONAL COMPUTER CARD RADIO MODEM USING NON-STANDARD POWER OUTPUT LEVEL

### **Background of the Invention**

The present invention relates to personal computer (PC) card radio modems. 5 Small hand-held personal computing devices can use Personal Computer Memory Card Interface Association (PCMCIA) radio modems to connect to a wireless network. PC card radio modems typically use battery power from the hand-held PC or from a battery pack extension.

A problem that exists in prior-art systems in which the wireless modem operates on a network such as the North American AMPS or CDPD network, is a battery pack extension is used to supplement the power supplied to the wireless modem. Typically, hand-held PCs use two AA batteries, which suffer from low capacity and a low peak current capability.

Six different standard RF power levels are required by the CDPD standard (CDPD R1.1 Part 409) and the AMPS standard (IS-19B) for a class III cellular device. With two AA batteries supplying the hand-held PC and the PCMCIA wireless card, it is difficult to achieve the highest RF power level; which, for a class III cellular device, is an output power of 28 dBm where 0 dBm is 1mW output power. Typically, prior art uses a battery pack extension on the PCMCIA card to achieve the highest RF power output.

20 This is an undesirable solution as the esthetics of the complete product are poor.

It is desirable to have an improved system, which avoids some of the problems of the prior art.

### Summary of the Invention

25

In one embodiment, the present invention relates to a PC card radio transceiver which uses a non-standard power output level. The non-standard power output level is limited by the peak sustainable current available from the battery inside the hand-held PC. In one embodiment, this current is limited to 600 mA. The non-standard RF power

-2-

obtainable, given a 600mA maximum limit, is typically between 24 dBm and 28 dBm (in one implementation, 26.5 dBm). The non-standard power output level has a nominal value less than the nominal value required by the standard, yet is still within the acceptable range (+2, -4dB) specified in the standard.

5

The advantage of the present invention is that the radio transceiver in the PC card can operate while attached to a hand-held PC without requiring a battery pack extension. The system allows the two AA batteries of the hand-held PC to produce an acceptable, high-level RF output power.

Implementation of a non-standard RF power level, which is based on a current restriction, requires the automatic leveling circuit (ALC) of the power amplifier to be a current leveling circuit as opposed to a power leveling circuit as in prior art systems. A current leveling circuit achieves the same effect as a power leveling circuit, given the load on the power amplifier remains constant. In practice, this is a reasonable assumption.

15

-3-

### **Detailed Description of the Preferred Embodiment**

Fig. 1 is a block diagram that illustrates a hand-held personal computer 20 and PC card 22. In one embodiment, the PC card is a cellular modern with a built-in radio transceiver.

5

10

15

20

25

The hand-held PC 20 sends signals to be transmitted to the PC card cellular modem 22. Additionally, the hand-held PC supplies power for the operation of the PC card cellular modem 22. Typically, two AA batteries in the hand-held PC power both the hand-held PC and the PC card cellular modem 22. Since relatively small batteries are used, the maximum current which can be drawn by the PC card cellular modem 22 is

limited to less than what is needed to meet the nominal output power requirements of IS-19B and CDPD Part 409 standards given present power amplifier and duplexer technologies. In one embodiment, the PC card cellular modem 22 should not draw more than 600 mA of current.

Fig. 2 is a simplified diagram of the elements in the PC card cellular modem of one embodiment of the present invention. A current leveling circuit 32 controls the current supplied to power amplifier 30 and hence indirectly controls the output power of amplifier 30. In a PC card cellular modem, the current supplied to the power amplifier makes up a large percentage of the total current consumed by the device. The output of the power amplifier 30 is sent to a duplexer 34, then out the antenna 36.

In the present invention, the current leveling circuit 32 limits the current used by the power amplifier 30 at the highest power output level. This highest power output level is the non-standard power output level described below.

In one embodiment, the current leveling circuit 32 limits the current drawn by the power amplifier 30 to 400 mA when it is transmitting at the highest output power level. The current consumption of the entire card is therefore limited to 600mA.

Fig. 3 illustrates the RF output levels for the standard and non-standard power outputs for CDPD standard R.1.1 Part 409 and AMPS standard IS-19B. There are six standard output power levels for a class III cellular device. The standard, nominal power WO 02/07494

-4-

output levels range from 8 to 28 dBm in 4 dB steps. In one embodiment, the nonstandard power output level is between the highest standard power level, which is not implemented (28 dBm), and the highest implemented power level (24 dBm). In one embodiment, by limiting the current draw by the power amplifier to 400 mA or less (the total PC card current draw to 600mA or less), the non-standard power output level is about 26.5 dBm. This level is below the nominal 28 dBm power level specified in the standard, yet still falls within the acceptable range of +2dB to -4dB from nominal specified in the standard.

Fig. 4 is a block diagram of a circuit to implement one embodiment of the present invention. A set point value 48 is sent to adder 40 and combined with a feedback value on line 44 from current-sensor 42 to produce a gate bias (power control) signal for power amplifier 46. The set point values are controlled by the micro-processor. Each set point value corresponds to a power output level for the power amplifier 46. The current leveling circuit limits the power output by the power amplifier. In a preferred embodiment, the maximum set point value is such that the current drawn by the power amplifier is less than 400 mA.

Fig. 5 illustrates details of one embodiment of the current leveling circuitry for operation with the PC card radio transceiver of the present invention.

Other modifications and implementations will occur to those skilled in the art, without departing from the spirit and scope of the present invention. Accordingly, the above description is not intended to limit the invention, which is to be limited only by the following claims.

15

20

5

10

### Claims:

5

1. A PC radio card adapted to be connected to and powered by a hand-held personal computer, the PC radio card using a number of output power levels controlled by current supplied to power amplifier in the PC radio card, the output power levels including multiple implemented standard power output levels and a nonstandard batterylimited power output level, the nonstandard battery-limited power output level being greater than the multiple implemented standard power output levels but less than an unimplemented standard power output level.

The PC radio card of Claim 1 wherein the non-standard battery-limited
 power output level is such that the current drawn by the power amplifier is 400 mA or less.

3. The PC radio card of Claim 1 wherein the PC radio card includes a current control automatic leveling circuit, keeping the current supplied to the power amplifier less than 400 mA.

15 4. The PC radio card of Claim 1 wherein the PC radio card is powered by a hand-held personal computer using two AA batteries.

5. The PC radio card of Claim 1 wherein the non-standard battery-limited power output level is less than 28 dBm and more than 24 dBm, wherein an output of 0 dBm is calibrated to 1 mW of output power.

20 6. A PC radio card adapted to be connected to and powered by a hand held personal computer, the PC radio card using a number of output power levels set by current supplied to power amplifier in the PC radio card, the output power levels including multiple implemented standard power output levels and a nonstandard battery-

10

15

-6-

limited power output level, the nonstandard battery-limited power output level being such that the current drawn by the power amplifier is 400mA or less.

7. The PC radio card of Claim 6 wherein the non-standard battery-limited power output level is greater than the implemented standard but less than an unimplemented standard power output level.

8. The PC radio card of Claim 6 wherein the PC radio card is powered by a hand-held personal computer using two AA batteries.

9. The PC radio card of Claim 6 wherein the PC radio card has a current controlled automatic leveling circuit to limit the current supplied to the power amplifier.

10. The PC radio card of Claim 6 wherein the non-standard battery-limited power output level is less than 28 dBm and more than 24 dBm when 0 dBm is calibrated to one mW of output power.

11. A system including:

a battery-powered hand held personal computer; and

a PC radio card connected to and powered by the hand held personal computer, the PC radio card using a number of output power levels set by current supplied to power amplifier in the PC radio card, the output power levels including multiple implemented standard power output levels and a nonstandard battery-limited power output level, the nonstandard battery-limited power output level being greater than the multiple

20 implemented standard power output levels but less than an unimplemented standard power output level.

12. The system of Claim 11 wherein the nonstandard battery-limited power level is such that the current drawn by the power amplifier is 400 mA or less.

-7-

13. The system of Claim 11 wherein the hand-held personal computer is powered two AA batteries

14. The system of Claim 11 wherein the nonstandard battery-limited power level limits the current supplied by the hand-held personal computer to the PC radio card
5 to less than a given amount.

15. The system of Claim 11 further comprising a current controlled automatic leveling curcuit in the PC radio card to limit the current supplied to the power amplifier.

16. A PC card transceiver including:

an antenna;

10

15

an amplifier operably connected to the antenna:

a current controller operably connected to the amplifier to set the power output of the transceiver, the current controller adapted to produce a number of standard transceiver power output levels and a nonstandard transceiver output power level, the nonstandard transceiver output power level being such that the amplifier current is at a level that makes efficient use of the PC card transceiver batteries.

17. The PC card of Claim 16, further comprising a duplexer operatively positioned between the amplifier and the antenna.

 The PC card of Claim 16 wherein the non-standard battery-limited power output level is greater than the implemented standard but less than an unimplemented
 standard power output level.

19. The PC card transceiver of Claim 16 wherein the amplifier is limited to 400 mA of current draw.

### · **-8-**

20. The PC card transceiver of Claim 16 wherein the PC card transceiver is adapted to be powered by a hand-held personal computer.

#### (57) Abstract

Digital data are stored in a memory means in prescribed arranging order and, when a data arrangement to be corrected for an error contained in the arrangement or a data arrangement to be produced is read out, the control of the access to the memory means is made easier, the number of accesses to the memory means is reduced and a data transfer speed is increased to thereby reduce the power consumption when using a semiconductor chip containing the memory means. The memory means which can switch the access bit width between (n) bits and (n x m) bits (n and m: natural numbers), a bus width switching means which can switch the memory access bit width between the (n) and (n x m) bits, and a control means which controls the access are provided. Since the control means controls the access so that the bus width can be switched to the (n x m) bit width at the time of reading out the data arrangement to be reproduced from the memory means, the number of accesses is reduced and the transferring speed of reproduced data is improved. When the memory means which can be changed in access bit width, a means required for the execution of processing, etc., are provided on the same semiconductor chip, the memory means is customized so that the access bit width can be variably set in accordance with each required means.

メモリ手段に対し、ディジタルデータを所定の配列順に記憶し、配列 中の誤り訂正を行うデータ配列、再生データ配列の読み出しを行う際に、 メモリ手段へのアクセス制御を容易に、アクセス回数の減少を実現する と共に、データの転送速度の向上を実現し、メモリ手段を含む半導体チ ップで実現した際の消費電力低減を実現する。

アクセスビット幅をnビット、n×mビット(n、mは自然数)と切 替可能なメモリ手段を設け、メモリ手段に対してアクセスビット幅をn ビット、n×mビットと切替え可能なバス幅切替手段と、アクセスを制 御する制御手段を設け、制御手段は再生データ配列をメモリ手段から読 みだす際には、n×mビット幅のバス幅とするように制御することによ りアクセス回数が減少、再生データの転送速度が向上する。

また、アクセスビット幅可変なメモリ手段と処理の実行に必要な手段 等を同一の半導体チップに設ける際、メモリ手段は必要なそれぞれの手 段に応じてアクセスビット幅を可変に設定できるようにカスタマイズさ れる。

8

処理について説明する。

第5図に示すように、光ディスク1に記録する単位であるフレーム5
01の構成は、フレームの先頭を示す同期信号502と、そのフレームについての再生時間情報などを記録したサブコード503、フレームデ
5 ータ504により構成される。フレーム同期信号の検出、EFM復調処理を行った後のサブコード、フレームデータは8ビットを1シンボルとした単位で構成され、フレームデータはデータ24シンボル、C1、C2訂正符号各4シンボル、合計32シンボルで構成される。元のオーディオ再生データを得る為には第6図に示すように復調処理を行ったフレームに対して、フレーム番号順に複数ならべたフレーム系列に対し(図中601)、C1訂正は奇数番号のシンボルデータを1フレーム分遅延

- 中0017、C1訂正は奇数番号のシンホルテーダを17レーム分遅延 した図中602に示す様なフレーム系列に対して行う。C2訂正はシン ボル毎に4フレーム遅延が増加、最大108フレーム遅延までのフレー ム系列(図中603)の32-4=28シンボルに対して行い、再生デ
- 15 ータはC2訂正を終了したフレーム系列内の0~11までのシンボル番号の系列604と、2フレーム分遅延したC2訂正フレーム系列内の1
   6~27までのシンボル番号の系列605からなる。

以上のような各系列のフレームデータに対する各処理を第1図で行い、 出力補間、フィルタ回路7への再生データ読み出しを2シンボル(1ワ

20 ード)単位で容易に行う為のシンボルデータの配置、及びメモリアドレス制御の方法を第3図を用いて説明する。

第3回において、304、305は再生データの読み出し制御を容易 にかつ、アクセス単位を1ワードとする事が可能なシンボル単位のデー タの配置例であり、304は第(n-3)フレーム目の0~11シンボ ル目までの再生データ系列、305は第(n-3)フレーム目の16~ 27シンボル目までの再生データ系列である。このような配置で再生デ

ータ系列を構成しようとすると、C2訂正系列は第6図で説明したC2 訂正系列603と再生系列604、605で示した関係のフレーム遅延 で与えられるので、再生データ系列中の0~15シンボルと、2フレーム遅延した再生データ系列の16~27シンボルとなる。従ってこの場
6の再生系列に対するC2訂正系列は、303の様に1列に並ぶ配置になる(第3図中、303は第(n-1)フレーム目のC2訂正系列を示す)。 C2訂正系列はC1訂正系列に対し最大フレーム遅延108フレームで、 1シンボル毎に4フレーム遅延が増加するので、303のC2訂正系列 に対し、C1訂正系列は302の様な配置になる。(図中302は(n
10 -1)フレーム目のC1訂正系列を示す)。更にC1訂正系列は、復調

- 系列に対して奇数シンボル番号が1フレーム遅延されるので、復調系列 は301の様な配置になる(図中301はnフレーム目の復調系列を示 す)。以上の各系列のシンボル配置をメモリでアクセス際のアドレス制 御方法は、アドレス制御を容易に行う為、例えば横方向に16シンボル、
- 15 縦方向に4個の64バイトをアドレス制御の1単位、1バンクとし(図中306)アドレス制御の際の基本単位としている。307は1バンクの縦方向のアドレスを示すカラムアドレス、308は横方向のアドレスを示すロウアドレスである。更にバンク単位のアドレス制御を行う為、カラムバンクアドレス309、ロウバンクアドレス310が与えられる。

20 アクセスする際にはロウバンク、カラムバンクアドレスと、バンク内の ロウ、カラムアドレスを指定してアドレス制御を行い、再生データ系の 読み出しの際には、2シンボル構成のワード単位の最初のシンボルに対 するアドレスを指定して、1 ワード単位のアクセスを行う(図中311)。

第3図で説明したアドレス制御方法を用い、第1図の再生装置におい 25 て再生データを得るまでの処理の流れを第2図のフローチャートを併せ て用いて説明する。

10

第1図において、アクセス開始命令に従い光ディスク1から信号の読 み出しが開始されると、11のアクセス制御回路Aは、10のセレクタ A、9のメモリセルA、12のアドレズ生成回路Aそれぞれの制御対象 に対し各制御命令を生成する。10のセレクタAはアクセス選択命令に 従い5のEFM復調回路からの8ビットデータバスとメモリセルAの1 6ビットデータバスの下位8ビットに接続、9のメモリセルAは8ビッ ト、16ビット切替命令に従い、シンボル単位の復調データをライトす る為、アクセスビット幅を8ビットに設定、リード、ライト切替命令に 従いライトを選択し、12のアドレス生成回路Aはアドレス系列選択命 令に従い、復調系列のアドレスを生成するように設定される(ステップ 201)。メモリセルAへのアクセス準備が完了するとEFM復調処理 が開始され、12のアドレス生成回路Aは第3図で説明したアドレスの 指定方法に従い、復調系列のロウ、カラムアドレス、ロウバンク、カラ ムバンクアドレスを1シンボルライト毎に生成、13のアドレスデコー ダAでメモリセルAのアドレスにデコードされ1シンボル毎にメモリセ

ここでアクセスビット幅が8、16ビットと可変な10のメモリセル Aについて説明する。第4図はメモリセルAの構成例で、8ビット単位 でアクセス可能な2つのメモリバンク401と402を持ち、行方向、 列方向のアドレスを指定する事でメモリバンクへのアクセスが可能とな っている。403はバンク切替用のセレクタでバンク選択信号に従い8 ビット単位アクセスのメモリバンク選択が可能である。404は8ビッ ト、16ビット切替命令に従い、メモリバンク108ビットバスを上位 8ビット、メモリバンク2の8ビットバスを下位8ビット、合計16ビ ットデータをして扱う場合と、セレクタ403で選択されたメモリバン ク1または2の8ビットデータを下位8ビットとし、リード時、上位8

ルAにライトされる(ステップ203)。

ビットのデータとして"0"を加え16ビットデータとした物の選択を 行うセレクタである。405はリード、ライト切替命令に従い、データ の転送方向を決定するI/Oバッファである。このような構成でメモリ セルAは構成され、アクセスビット幅の切替が可能になる。なお、物理 的にバスを切り替える変わりに、物理的にはすべてのバスが接続されて いるがその時に使用するバス幅分のバスのみを有効にする構成としても 構わない。

C2訂正可能な復調フレームのライトが終了したと判断されると(ス テップ204)、アクセス制御回路Aは各制御対象に対しC1訂正系列 のフレームをメモリセルAからリードする為の命令を生成する。セレク タAはC1、C2訂正回路にC1訂正系列のシンボルデータをリード可 能な様にC1、C2訂正回路への8ビットデータバスとメモリセルAの 16ビットデータバスの下位8ビットを接続、メモリセルAはリードを 選択、アドレス生成回路AはC1訂正系列のアドレスを生成するように 設定される(ステップ205)。C1訂正処理の為のメモリアクセス選 15 択が終了すると、アドレス生成回路AはC1訂正系列のロウ、カラム、 ロウバンク、カラムバンクアドレスを1シンボルリード毎に生成、アド レスデコーダAでメモリセルAのアドレスにデコードされ1シンボル毎 にС1訂正系列データがメモリセルAからリードされ(ステップ20 6)、リードされたC1訂正系列のフレームに対して系列中に発生した 20 エラーの訂正が実行される(ステップ207)。

C1訂正系列の処理が終了すると、アクセス制御回路Aは各制御対象 に対してC2訂正系列のフレームをメモリセルAからリードする為の命 令を生成する。アドレス生成回路AはC2訂正系列のアドレスを生成す るように設定され(ステップ208)、 C2訂正系列のロウ、カラム、 ロウバンク、カラムバンクアドレスを1シンボルリード毎に生成、アド

12

レスデコーダAでメモリセルAのアドレスにデコードされ1シンボル毎 にC2訂正系列データがメモリセルAからリードされ(ステップ20 9)、リードされたC2訂正系列のフレームに対して系列中に発生した エラーの訂正が実行される(ステップ210)。

- 5 C2訂正系列の処理が終了すると、アクセス制御回路Aは各制御対象に 対して再生データ系列を1ワード(2シンボル)単位でメモリセルAか らリードする為の命令を生成する。セレクタAは1ワード単位で処理を 行う出力補間、フィルタ回路7への16ビットデータバスとメモリセル Aの16ビットデータバスを接続、出力補間、フィルタ回路7への1ワ
- 10 ード単位のデータ転送を可能にし、メモリセルAはアクセスビット幅を 16ビットに選択、アドレス生成回路Aは再生データ系列のアドレスを 生成するように設定(ステップ211)、リードの単位である2シンボ ルデータの中で最初にアクセスを行うのロウ、カラム、ロウバンク、カ ラムバンクアドレスを1ワードリード毎に生成し、アドレスデコーダA
- 15 でメモリセルAのアドレスにデコードし再生データをリードする(ステ ップ212)。リードされた再生データは7の出力補間、フィルタ回路 において、訂正不能の場合は補間処理が行われ、フィルタ処理後、出力 端子8より出力される。再生を継続する場合には、ステップ201から 処理を再開する(ステップ213)。
- 第1の実施形態の例において、光ディスク1から読み取られ、ディジタル化されたシリアルデータに対する復調方法が、シリアルデータに同期して送られてくるビットクロック17個分のシリアルデータ(復調データ14ビットとマージン3ビット単位でシリアル転送される)から8ビット単位のパラレルデータにEFM復調回路で変換される場合、シリ
   アルデータの転送回数を示すビットクロック数と、出力補間、フィルタ
- 回路へ16ビット単位でデータ転送を行う際のメモリのアクセス回数と

25

13

の関係は、アクセスビット幅可変なメモリを用いた場合、誤り訂正符号 等の冗長分を考慮し冗長度が100%とすると、ビットクロック(17+ 17)個に対して、8ビットで書き込まれたメモリから16ビットのデー 夕量のデータ転送が1回で行われるので34:1となり、また、冗長度 が0の場合17:1の関係となる。よって、一般的に冗長度は100% より小、0%より大であるので、ビットクロック周波数1に対して、出 力転送周波数Foは1/34<Fo<1/17となる。

これに対して、出力補間、フィルタ回路へのデータ転送が1回につき 8ビット単位であれば、同じ16ビットのデータ量を転送するのに2回 10 の転送が必要となり、上記と同様の条件の場合、ビットクロック周波数 1に対して、出力転送周波数Foは1/68<Fo<1/34となり、 アクセスビット幅可変なメモリを用いた場合よりもデータの転送効率が 低下する。

以上のように本発明の第1の実施の形態においては、光ディスクから 15 読みだされた信号に対し同期信号の検出、復調処理後のシンボル単位の データ書込みから、再生データの読み出しを行うまでの処理に対するア ドレス制御を、まとまった複数シンボル単位で1バンクを構成、1バン ク中のロウ、カラムアドレスと、バンクに対するロウ、カラムアドレス を指定してアクセス制御を行う事によりアドレス制御が容易となる。

20 また、アドレス制御を行う際の再生データ系列の配置を工夫する事に より、2シンボル単位でアクセス、データリードが可能となり、再生デ ータに対する出力処理を2シンボル単位で行う事ができる。

また、再生データ系列の読み出しの際のメモリセルAのアクセスビッ ト幅を16ビット、リード単位を1ワード単位で行える為、メモリアク セス回数が減少し、再生装置全体の消費電力低減につながる。

また、以上説明した再生処理に必要なメモリセルA、各処理回路、制

御回路を同一の半導体チップ上に設けた場合でもメモリアクセス回数が 減少し、半導体チップ全体の消費電力低減につながる。

第7図は本発明による再生装置及び再生方法の第2の実施の形態を示 すブロック図であって、参照数字1はホストコンピュータで処理を行う 5 ディジタルデータが記録された光ディスク、14はメモリセルAから1 ワード単位でリードされた再生データで構成されるセクタの先頭を検出 するセクタ同期信号検出回路、15は1セクタ内に含まれる訂正符号の 復号によりセクタ中に発生したエラーの訂正を行うP,Q訂正回路、1 6はホストコンピュータと再生装置の間で2ワード(32ビット)単位

25

25

カラムアドレスを生成、32ビット単位のデータの最初にアクセスする ロウ、カラムアドレスを指定する。アドレスデコーダCは生成された3 2ビット単位の先頭アドレスをメモリセルCのアドレスにデコードし、 1回のアクセスにつき32ビット単位でリード、インターフェイス回路 16に転送、訂正ブロック中に含まれるメインデータに転送処理を行う (ステップ14K)。ホストコンピュータからの転送要求セクタ数に満 たない場合(ステップ14L)、ステップ14Cから処理を繰返し、要 求セクタ数に達したのであれば、処理を終了する。

この第3の実施形態において、光ディスク1から読み取られ、ディジ クル化されたシリアルデータに対する復調方法が、シリアルデータに同 期して送られてくるビットクロック16個分のシリアルデータから8ビ ット単位のパラレルデータにデータ復調回路で変換される場合、シリア ルデータの転送回数を示すビットクロック数と、インターフェイス回路 から32ビット単位でデータ転送を行う際の転送回数との関係は、アク

15 セスビット幅可変なメモリを用いた場合、誤り訂正符号等の冗長分を考慮し冗長度が100%とすると、ビットクロック(16+16)個に対して、8ビットで書き込まれたメモリから32ビットのデータ量のデータ転送が1回で行われるので32:1となり、また、冗長度が0の場合16:1の関係となる。よって、一般的に冗長度は100%より小0%よりり大であるので、ビットクロック周波数1に対して、出力転送周波数Foは1/32<Fo<1/li>

これに対して、インターフェイス回路からのデータ転送が1回につき 16ビット単位であれば、同じ32ビットのデータ量を転送するのに2 回転送が必要となり、上記と同様の条件の場合、ビットクロック周波数 1に対して、出力転送周波数Foは1/64<Fo<1/32となる。 更にインターフェイス回路からのデータ転送或は、メモリ手段からイ

26

ンターフェイス回路へのデータ転送が8ビット単位で行われるのであれ ば、32ビットのデータ量を転送するのにインターフェイス回路からの 転送或はメモリアクセスが4回必要となり、上記と同様の条件の場合、 ビットクロック周波数1に対して、出力転送周波数Foは1/128< Fo<1/64となり、データ転送効率が著しく低下する。

従って第3の実施の形態においては、光ディスクから読みだされた信 号に対し必要な処理を行い、インターフェイス回路を通じてホストコン ピュータにデータ転送を行う際には、32ビット単位で行う事により、 ホストコンピュータへのデータの転送速度が向上する。また、メモリセ

10 ルCのアクセス回数が減少するので、上記した複数の訂正ブロックを一時的に記憶するのに必要な大容量のメモリセルCを含む、再生装置全体の消費電力低減につながる。

また、以上説明した再生処理に必要なメモリセルC、各処理回路、制御 回路を同一の半導体チップ上に設けた場合でも、ホストコンピュータに

15 データ転送を行う際には、32ビット単位で行う事が可能となりデータ 転送速度が向上すると共に、メモリアクセス回数が減少し、半導体チッ プ全体の消費電力低減につながる。

また、アクセスビット幅可変なメモリを制御する制御手段は、同等の 制御機能を実現する様にプログラムされたマイクロプロセッサを用い実 現してもかまわず、プログラムの変更により可変なアクセスビット幅を、 処理を実行するディジタル信号のビット幅に合わせ、変更できるように

20 して処理を実行してもよく、この場合アクセスビット幅可変なメモリとマイクロプロセッサを含む所定の処理を行う手段を同一の半導体チップ上に設る事により実現される。

また、アクセスビット幅可変なメモリを同一の半導体チップ上に設け る場合、メモリは一定時間間隔で書換が必要なダイナミックなメモリ、 あるいは書換動作の必要が無いスタティックなメモリどちらで実現して も構わない。

37

また、第1から第5の実施の形態で用いるメモリセルの構成はこの実施の形態に限定される物でなく、アクセスを行う処理手段に応じてアク セスビット幅を可変にできるメモリセルであればどんな構成をとっても 構わない。

- 5 第1の実施の形態におけるアドレス制御の単位である1バンクの構成 は、この実施の形態に限定される物でなく、メモリ等の一時記憶手段に 記録、所定の処理を行った後の転送データに対するアクセスが容易にな るような1バンク構成が採用される。
- 第2、第3、第4の実施の形態における、メモリセルB、メモリセル
  10 Cにおいて、各処理を行う際に必要なデータ系列のアクセスに対するアドレス制御方法は、第1図の実施の形態で説明した、1バンク単位で、1バンク中のロウアドレス、カラムアドレス、バンクに対するロウバンクアドレス、カラムバンクアドレスを指定することにより行ってもよい。第2、第3、第4、第5の実施の形態におけるホストコンピュータと
- 15 の間でデータ転送を行うインターフェイス回路はこの実施の形態に限定 される物でなく、ホストコンピュータとのアクセスバス幅が64ビット あるいはそれ以上でも構わない。この場合メモリセルはインターフェイ ス回路との間で64ビット単位、或はそれ以上のアクセスビット幅でデ ータ転送を実行し、それぞれのアクセスビット幅に対応したメモリセル、
   20 アクセスの対象を制御するセレクタが用意される。

また、第4の実施の形態において記録可能な光ディスク1にあらかじ め記録されている物理IDの検出方法は、この実施の形態に限定される 物でなく、光ディスク中の記録トラックをうねらせIDの代用となる物 を記録した光ディスクの記録にも適応される。この場合のID検出は例 えば、トラックのうねりによる周波数変化を物理ID検出回路で計測し、

光ディスク上のアドレスとして認識され処理が行われる。

10

. - -

38

また、説明した全ての実施の形態において用いられるメモリ手段の、 可変なアクセスビット幅の種類は、この実施の形態に限定される物でな く、メモリ手段に記憶されているデータ配列に対して、処理を実行する 手段が最も効率よく処理を行えるようアクセスする処理手段に応じて何 種類にでも切替えるようにしても良い。

また、説明した全ての実施の形態を実現する為に必要なメモリセル、 各処理回路、制御回路、或は処理回路、制御回路と同等の処理をプログ ラム制御により実行するマイクロプロセッサを同一の半導体チップ上に 設けることによっても、再生装置、記録装置と同様の処理が実現できる。

産業上の利用可能性

本発明によると、光ディスクから読みだされた信号に対しデータ復調 処理後の1シンボル(8ビット)単位のデータ書込みから、2シンボル (16ビット)単位で再生データの読み出しを行うまでのアドレス制御

15 を、まとまった複数シンボル単位で1バンクを構成し、1バンク中のロウ、カラムアドレスと、バンクに対するロウバンク、カラムバンクアドレスを指定して1又は2シンボル単位のデータに対するアクセスを行う事によりアドレス制御が容易となる。

また、アドレス制御を行う際の再生データ系列の配置を工夫し、それ
20 に対するC1、C2訂正系列、復調系列の配置でアドレス制御する事により1回のアクセスで再生データを2シンボル転送する事が容易になる。
また、再生データ系列の読み出しの際のアクセスビット幅を16ビット或は32ビットで行うため、再生データを1回のアクセスにつき16
ビット或は32ビット単位で転送でき、再生データに対して補間、フィ
25 ルタ処理を行う手段やホストコンピュータとのインターフェイス手段へのこのももいます。

のデータ転送速度が向上し、インターフェイス手段からホストコンピュ

ータへのデータ転送速度も向上する。また、一連のディジタル信号処理 を行う際に必要なメモリアクセス回数を減少させる事ができる。

また、一連のディジタル信号処理に必要なメモリ手段、各処理回路、 制御回路を同一の半導体チップ上に設ける際には、各処理を効率良く行

- 5 うために必要なメモリ手段へのアクセスビット幅の単位で処理を行える ように構成される。例えばEFM復調回路は8ビット単位で復調データ を出力するように構成され、16ビットディジタルオーディオ再生デー タに対する出力補間、フィルタ処理回路はデータの単位にあわせて16 ビット単位で処理を行うよう構成、ホストコンピュータとの間でデータ
- 10 転送を行うインターフェイス回路は、ホストコンピュータとのインター フェイスバス幅にあわせて16ビット、32ビット或はそれ以上のバス 幅でメモリ手段とのデータ転送を行うように構成される。これら処理回 路により異なるアクセスビット幅に対し、メモリ手段は可変なアクセス ビット幅の種類に対応したアクセスが可能なようにカスタマイズされ、
- 15 アクセスする対象に従って可変にアクセスビット幅を設定できるような メモリ手段が半導体チップ上に設けられる。

このように一連のディジタル信号処理に必要な手段とアクセスビット 幅を可変に設定できるようにカスタマイズされたメモリ手段を同一の半 導体チップ上に実現した場合でも、メモリアクセス回数の減少による半 20 導体チップ全体の消費電力低減、一連のディジタル信号処理の高速処理 が実現できると共に、半導体チップから出力される再生データの転送速 度向上が実現できる。また、アクセスビット幅可変にカスタマイズされ たメモリ手段をダイナミックなメモリで構成した場合には、大容量メモ リを必要とするディジタル信号処理システムを同一の半導体チップ上に 実現でき、消費電力の低減、高速な信号処理、半導体チップからのデー 夕転送速度の向上の効果を得る事ができる。

## 請求の範囲

記録媒体からの読み出し信号に対し所定の信号処理を行う信号処理
 手段と、データを一時的に記憶するメモリ手段を有し信号処理後のディ

5 ジタルデータを出力するディジタル信号再生装置であって、

有効アクセスビット幅をnビットとn×mビット(n、mは自然数) に変更可能なバス幅可変手段と、

前記メモリ手段のアクセスを行う制御手段とを有し、

該制御手段は、前記バス幅可変手段により、前記メモリ手段の有効ア

10 クセスビット幅をnビットとn×mビットのバス幅に変更可能であり、 少なくとも、前記メモリ手段に対して、nビット単位のディジタルデー 夕の書込みを行い、n×mビット単位で読出しを行うことを特徴とする バス幅可変メモリを用いたディジタル信号再生装置。

2.請求の範囲第1項記載のバス幅可変メモリを用いたディジタル信号
 15 再生装置において、

- 前記制御手段は、前記メモリ手段のアクセスとして、nビット単位で、 ディジタルデータを所定の順番に配列するためのデータの書込み、及び、 配列中のデータに含まれる誤り訂正に必要な処理を実行する為のデータ 系列の読み出しを行い、n×mビット単位で転送データ系列の読み出し
- 20 を行うことを特徴とするバス幅可変メモリを用いたディジタル信号再生装置。

3.請求の範囲第2項記載のバス幅可変メモリを用いたディジタル信号 再生装置において、

前記バス幅可変手段と、メモリ手段と、少なくとも前記誤り訂正を行 25 う訂正手段は、同一の半導体チップ上に設けることを特徴とするバス幅 可変メモリを用いたディジタル信号再生装置。

4.請求の範囲第3項記載のバス幅可変メモリを用いたディジタル信 号再生装置において、

前記メモリ手段は、一定時間で書き直し動作が必要なダイナミックな メモリを用いることを特徴とするバス幅可変メモリを用いたディジタル 5 信号再生装置。

5.請求の範囲第1項記載のバス幅可変メモリを用いたディジタル信号 再生装置において、

前記メモリ手段は、nビット幅でアクセスを行う一時記憶手段m個からなり、

10 前記バス幅可変手段は、前記m個の一時記憶手段の選択を行う第1の
 選択手段と、

該第1の選択手段で選択されたnビットデータバスと、m個の一時記 憶手段で構成されたn×mビットデータバスの選択を行う第2の選択手 段と

15 を有することを特徴とするバス幅可変メモリを用いたディジタル信号 再生装置。

6. 請求の範囲第1項記載のバス幅可変メモリを用いたディジタル信号 再生装置において、

記録媒体からの読取り信号を復調し該復調データをnビット単位で出 20 力する復調手段と、

誤り訂正処理に対するデータ配列に対し、nビット単位で処理を行う 誤り訂正手段と、

誤り訂正後のデータ配列に対し、n×mビット単位で処理を行う出力 処理手段と、

25 前記メモリ手段のデータバスに対し、前記復調手段、誤り訂正手段、 出力処理手段のデータバスを選択的に接続する接続手段と

前記復調手段、誤り訂正手段、出力処理手段のそれぞれの処理に必要 な、データ配列のアクセスに必要なアドレスを生成するアドレス生成手 段と、

生成されたアドレスをメモリ手段上のアドレスにデコードする手段と、 前記メモリ手段、接続手段、アドレス生成手段に対する制御命令を生 成する手段とを有し、

前記制御手段は、前記メモリ手段のアクセスとして、n ビット単位で、 復調後のディジタルデータを所定の順番に配列するためデータの書込み、 及び、配列中のデータに含まれる誤り訂正に必要な処理を実行する為の

- 10 データ系列の読み出しを行い、n×mビット単位で前記出力処理手段への転送データの読み出しを行う際に、n×mビットのバス幅とすることを特徴とするバス幅可変メモリを用いたディジタル信号再生装置。
   7.請求の範囲第6項記載のバス幅可変メモリを用いたディジタル信号再生装置において、
- 15 前記アドレス生成手段は、前記復調手段からのデータ書込み、前記誤り 訂正手段へのデータ読み出し、前記出力手段へのデータ読み出しを行う 時、それぞれの処理の対象のデータ配列に対しn×iビット(iは自然 数)と(n×m)×jビット(jは自然数)を単位とするバンク単位で アクセスを行うために、1バンク単位の縦方向のアドレスと横方向のア
- 20 ドレス、及び、各バンクにおける、縦方向のバンクアドレス、横方向の バンクアドレスをそれぞれ生成することを特徴とするバス幅可変メモリ を用いたディジタル信号再生装置。

8. 請求の範囲第1項記載のバス幅可変メモリを用いたディジタル信号 再生装置において、

25 記録媒体からの読取り信号を復調し該復調データをnビット単位で出 力する復調手段と、

5

誤り訂正処理に対するデータ配列に対し、nビット単位で処理を行う 誤り訂正手段と、

誤り訂正後のデータ配列に対し、n×mビット単位でデータを受付け、 n×mビット単位でホストコンピュータへデータ転送を行うインターフ 5 ェイス手段と、

前記メモリ手段のデータバスに対し、前記復調手段、誤り訂正手段、 インターフェイス手段のデータバスを選択的に接続する接続手段と 前記復調手段と前記誤り訂正手段のそれぞれの処理に必要なデータ配 列及び前記インターフェイス手段へデータ転送を行う際に必要なデータ

10 配列のアクセスに必要なアドレスを生成するアドレス生成手段と、 生成されたアドレスをメモリ手段上のアドレスにデコードする手段と、 前記メモリ手段、接続手段、アドレス生成手段に対する制御命令を生 成する手段とを有し、

前記制御手段は、前記メモリ手段のアクセスとして、nビット単位で、 25 変調後のディジタルデータを所定の順番に配列するためデータの書込み、 及び、配列中のデータに含まれる誤り訂正に必要な処理を実行する為の データ配列の読み出しを行い、n×mビット単位で前記インターフェイ ス手段へ転送データの読み出しを行う際に、n×mビットのバス幅とす ることを特徴とするバス幅可変メモリを用いたディジタル信号再生装置。

20 9. 請求の範囲第8項記載のバス幅可変メモリを用いたディジタル信号 再生装置において、

前記復調手段へ送られるシリアルデータの復調方式が、 k ビットを n ビット(k、nは自然数)に復調する方式であり、シリアルデータの復 調手段への転送回数を示すビットクロックの単位時間当たりのクロック 数と、1回の転送につき n × m ビット単位の前記データ転送を行う際の 単位時間当たりの転送回数の関係が、1:1/k~1:1/2 k の範囲の

関係である事を特徴とするバス幅可変メモリを用いたディジタル信号再 生装置。

10. アクセスビットバス幅が可変な、データを一時的に記憶するメモ リ手段を用いた、記録媒体からのディジタル信号を再生する再生装置の 再生方法であって、

アクセス命令に呼応して、記録媒体からの読取り信号を復調し該復調 データをnビット単位でメモリ手段に書き込むためのアドレス生成、メ モリアクセスを行う第1のステップと、

復調データのメモリ手段への書込みが終了した事に呼応して、誤り訂
 10 正処理のために該復調データをnビット単位でメモリ手段から読み出す
 ためのアドレス生成、メモリアクセスを行う第2のステップと、

誤り訂正処理が終了した事に呼応して、メモリ手段に対してはアクセ スビット幅をn×mビットを指定し、誤り訂正処理後の再生データを出 力するようにアドレス生成、メモリアクセスを行う第3のステップによ

15 りディジタル信号を再生することを特徴とするバス幅可変メモリを用い たディジタル信号の再生方法。

11.請求の範囲第10項記載のバス幅可変メモリを用いたディジタル 信号の再生方法において、

前記アクセス命令は、前記再生装置のホストコンピュータとのインタ 20 ーフェイス手段から受付けた命令であって、

前記第3のステップにおける再生データの出力は、インターフェイス 手段を介してホストコンピュータへデータ転送することを特徴とするバ ス幅可変メモリを用いたディジタル信号の再生方法。

12. ディジタルデータに対し所定の信号処理を行う信号処理手段と、 データを一時的に記憶するメモリ手段を有し信号処理後のディジタルデ

ータを記録媒体に記録するディジタル信号記録装置であって、

有効アクセスビット幅をnビットとn×mビット(n、mは自然数)に変更可能なバス幅可変手段と、

前記メモリ手段のアクセスを行う制御手段とを有し、

該制御手段は、前記バス幅可変手段により、前記メモリ手段の有効ア 5 クセスビット幅をnビットとn×mビットのバス幅に変更可能であり、 少なくとも、前記メモリ手段に対して、n×mビット単位でディジタル データの書込みを行い、nビット単位で読出しを行うことを特徴とした バス幅可変メモリを用いたディジタル信号記録装置。

13.請求の範囲第12項記載のバス幅可変メモリを用いたディジタル10 信号記録装置において、

前記制御手段は、前記メモリ手段のアクセスとして、n×mビット単 位で、ディジタルデータを所定の順番に配列するためデータの書込み、 及び、配列中のデータに含まれる誤り訂正に必要な処理を実行する為の データ系列の読み出しを行い、nビット単位で転送データ系列の読み出

15 しを行うことを特徴とするバス幅可変メモリを用いたディジタル信号記録装置。

14.請求の範囲第13項記載のバス幅可変メモリを用いたディジタル 信号記録装置において、

前記バス幅可変手段と、メモリ手段と、少なくとも前記誤り訂正を行 20 う訂正手段は、同一の半導体チップ上に設けることを特徴とするバス幅 可変メモリを用いたディジタル信号記録装置。

15.請求の範囲第14項記載のバス幅可変メモリを用いたディジタル 信号記録装置において、

前記メモリ手段は、一定時間で書き直し動作が必要なダイナミックな 25 メモリを用いることを特徴とするバス幅可変メモリを用いたディジタル 信号記録装置。

.....

16.請求の範囲第12項記載のバス幅可変メモリを用いたディジタル 信号記録装置において、

前記メモリ手段は、nビット幅でアクセスを行う一時記憶手段m個からなり、

5 前記バス幅可変手段は、前記m個の一時記憶手段の選択を行う第1の 選択手段と、

該第1の選択手段で選択されたnビットデータバスと、m個の一時記 憶手段で構成されたn×mビットデータバスの選択を行う第2の選択手 段とを有することを特徴とするバス幅可変メモリを用いたディジタル信

10 号記録装置。

17.請求の範囲第12項記載のバス幅可変メモリを用いたディジタル 信号記録装置において、

ホストコンピュータからのn×mビット単位の転送データを受信し、 前記メモリ手段へn×mビット単位でデータ転送を行うインターフェイ 15 ス手段と、

該インターフェイス手段からのn×mビット単位の転送データに対し 記録媒体に記録する必要のある付加データを生成し、該付加データを付 加したデータをn×mビット単位で出力する付加データ生成手段と

誤り訂正処理を行うデータ配列に対し訂正符号を生成しnビット単位 20 で出力する訂正符号生成手段と、

変調処理を行うデータ配列をnビット単位で入力し変調データを出力 する変調手段と、

メモリ手段のデータバスに対し、前記付加データ生成手段、訂正符号 生成手段、変調手段とのデータバスを選択的に接続する接続手段と、

25 前記付加データ生成手段、訂正符号生成手段、変調手段それぞれの処理に必要なデータ配列のアクセスに必要なアドレスを生成するアドレス

生成手段と、

20

生成されたアドレスをメモリ手段上のアドレスにデコードする手段と、 前記メモリ手段、接続手段、アドレス生成手段に対する制御命令を生 成する手段とを有し、

- 5 前記制御手段は、前記メモリ手段のアクセスとして、n×mビット単位でホストコンピュータから転送され、記録媒体に記録する際に必要な付加データが付加されたn×mビット単位のディジタルデータを、所定の順番に配列するためデータの書込みを行う際に、n×mビットのバス幅とし、nビット単位で、配列中のデータに含まれ誤り訂正符号の付加
- 10 を実行するのに必要なデータ配列の読み出し、及び、変調処理を行う変 調データのデータ配列に対する読み出しを行う際に、nビットのバス幅 とすることを特徴とするバス幅可変メモリを用いたディジタル信号記録 装置。

18.請求の範囲第17項記載のバス幅可変メモリを用いたディジタル
 15 信号記録装置において、

前記アドレス生成手段は、前記付加データ生成手段からのデータ書込 み、前記訂正符号生成手段へのデータ読み出し、前記変調手段へのデー 夕読み出しを行う時、それぞれの処理の対象のデータ配列に対しn×i ビット(iは自然数)と(n×m)×jビット(jは自然数)を単位と するバンク単位でアクセスを行うために、1バンク単位の縦方向のアド レスと横方向のアドレス、及び、各バンクにおける、縦方向のバンクア ドレス、横方向のバンクアドレスをそれぞれ生成することを特徴とする バス幅可変メモリを用いたディジタル信号記録装置。

19.請求の範囲第17項記載のバス幅可変メモリを用いたディジタル
 25.信号記録装置において、

前記変調手段の変調方式が、 n ビットを k ビット (n、 k は自然数)

. •

4 8

に変調する方式であり、1回の転送につきn×mビット単位の前記イン ターフェイス手段からの前記データ転送を行う際の単位時間当たりの転 送回数と、前記変調手段からのシリアルデータの転送回数を示すビット クロックの単位時間当たりのクロック数の関係が、1:mk~1:2m kの範囲の関係である事を特徴とするバス幅可変メモリを用いたディジ タル信号記録装置。

20. アクセスビットバス幅が可変な、データを一時的に記憶するメモ リ手段を用いた、ホストコンピュータからの転送データを記録媒体に記 録する記録装置の記録方法であって、

- 10 ホストコンピュータからの記録開始に呼応して、n×mビット単位の ホストコンピュータからの転送データに対し記録媒体に記録する必要の ある付加データを付加したデータをn×mビット単位でメモリ手段に書 き込むためのアドレス生成、メモリアクセスを行う第1のステップと、 該付加データのメモリ手段への書込みが終了した事に呼応して、メモ
- 15 リ手段に対しアクセスビット幅をnビットに指定し、誤り訂正符号を付加する処理のために前記付加データをnビット単位でメモリ手段から読み出すためのアドレス生成、メモリアクセスを行う第2のステップと、

誤り訂正符号付加後データのメモリ手段への書込みが終了した事に呼応して、メモリ手段に対しアクセスビット幅をnビットに指定し、変調

20 処理のためのメモリ手段から読み出すためのアドレス生成、メモリアク セスを行う第3のステップにより変調処理後のデータを記録媒体に記録 することを特徴とするバス幅可変メモリを用いたディジタル信号の記録 方法。

21.記録媒体からの読み取り信号を復調する復調手段と、データを一
 25 時的に記憶するメモリ手段と、復調後のデータを誤り訂正処理する誤り

(54) Power management for a portable computer

4

.

۰.

(57) A power manager (PMGR) within a portable laptop computer provides power (via 26) and clocking control (via 27) to various units within the computer in order to conserve battery power. Transistor switches controlled by the power manager control the distribution of power and clock signals to the various units within the computer. The power manager includes a software routine for continually monitoring various units and when certain units are either not needed and/or not currently in use, power and/or clock signals are removed from a given unit, and the computer can be switched between three modes viz. normal, slow and sleep.

#### - 1 -POWER MANAGEMENT FOR A LAPTOP COMPUTER.

### **BACKGROUND OF THE INVENTION**

1. Field of the Invention

The present invention relates to a power distribution scheme in a portable computer and, more specifically, to power management in a laptop computer.

2. Prior Art

Power consumption in an electronic device is always a significant concern and a power supply must be designed to adequately power the device. Aside from the capability of the power supply to provide ample power to power the corresponding device, heat dissipation, physical size, weight, efficiency, and other related characteristics are paramount in designing or selecting the power source. These characteristics become exceptionally critical when the device the power supply is to support is a self-sufficient

15 portable unit.

In many portable units, a self-supporting power source, such as a battery, is used to provide the power when the unit is decoupled from its main or external power source, such as 110 Volt AC (ordinary house current). Typically a battery is used to provide the independent and portable power

20 source. In some instances the battery functions as an auxiliary power source to maintain certain critical circuits active, such as keeping the memory alive to retain any information stored in the memory. In other instances, the battery functions as the main power source to fully power the device.

In the area of information processing, miniaturization of processing devices has permitted the portability of computing devices. One of the first such portable processing devices was a hand held calculator, wherein the calculator operated from a battery power source and could easily be carried about by the user. The battery would power all of the functions of the calculator and the user could readily transport the calculator without any attachment to an external power source. The batteries were either replaced or recharged. The earliest calculators simply had an on/off state in which full power was available during the on state and the power was completely shut off during the off state.

- 5 Because of the volatile nature of many early semiconductor memories, information stored in such volatile memories were lost when the calculator was turned off. Subsequent calculators attempted to incorporate nonvolatile memory, or in the alternative, standby power was provided to such a memory when the device was turned off, so that the memory retained whatever
- 10 information was present. More advanced schemes were devised to monitor various functions, so that power was removed from various elements when those elements were not needed. Further, a time-out scheme was devised to put the calculator in a stand-by mode, such as when a key was not depressed after a certain time period, in order to preserve power. All of these features
  15 were devised primarily to extend the time period that the device could operate from its internal power source.

When the processing technology was expanded beyond a simple calculator to encompass personal desk top computers, additional constraints were placed to power consumption and management control schemes. Aside from the additional circuitry, additional memory devices consumed considerable amounts of power. These memory devices include semiconductor devices, such as read-only memories (ROMs) and random-access memories (RAMs) which include volatile and non-volatile memories, floppy disk drives and hard disk drives and other magnetic media. Also, additional

25 power is required to power the display unit which typically includes a viewing screen. Various schemes were devised to monitor and control the power distribution during on/off states.

- 2 -

·....

However, as the personal desk top computer systems are made portable, it is desirable to provide a computer which contains a fully contained power source so that the computer is completely portable. These self sufficient computer systems are typically referred to as laptops (because of the

- 3 -

- 5 small physical size and light weight) and are designed to operate for a certain number of hours from its internal power source, which is typically a battery. Although a variety of the portable calculator technology can be implemented within such a laptop, additional constraints are placed in that the additional circuitry, memory, viewing screen and any peripheral devices attached to the
- 10 system will necessarily consume additional power. In order to extend the selfsustaining time period of these laptops while keeping the battery size and weight to a minimum, a sophisticated power management scheme is required to provide power only to those circuits and devices which require such power and to remove power, or at least to make a given circuit enter a low power
- 15 consumption mode, when that circuit is not needed. The management scheme must also continually monitor the various circuits and devices in order that power can be applied immediately to activate such circuits and devices when needed.

The present invention provides for such a power management apparatus for a laptop computer in order to extend the self-sustaining time period so that the laptop computer can operate for an extended period of time once external power is disconnected.

3. Prior Art References

A number of prior art references are known for monitoring and controlling the consumption of power to a device or to a portion of a device including a means of providing a timeout when user interaction has not occurred for a given time period. However, these references pertain to the simpler calculator technology or to portions of a computer system and fail to disclose the sophisticated power management scheme for a laptop of the present invention. ### SUMMARY OF THE INVENTION

The present invention describes a power manager for use in a laptop computer. The laptop computer is a fully self-sufficient computer which is powered by an internal battery when the computer is disconnected from an external power source. Because power conservation is paramount to sustain the computer as long as possible from the internal battery, a power manager is provided to monitor and control various circuit operations. Various units of the computer, including peripheral units, generally function equivalently to

well-known personal desktop computers. However, the power source to the various devices are controlled by the power manager and a plurality of transistor switches are used to switch the power source to the various devices. The operation of these switches is controlled by the power manager.
 Additionally, various clock signals are also coupled through switches which are controlled by the power manager so that the clock signals can be

disconnected from certain units of the computer.

The power manager continually monitors various circuit functions such that devices not in use have their power sources or clock signals disconnected in order to deactivate devices to conserve battery power. The removal of clock signals from those units having clock control places these various units into an inactive state. However, because power is still applied to these units, various internal states retain their current state until the clock signal is restored.

The power manager is capable of operating in one of three modes of operation. In a first mode the computer operates in a normal active mode where most of the units are active at all times and/or some of the other units are caused to be made active when needed. A second state is a sleep state in which the computer enters into an inactive state and the power manager continues to monitor various circuit conditions. When a certain predetermined

- 5 -

condition occurs, it causes the computer to awake from its sleep state. A third state is an intermediate state in which the power manager controls the frequency of the clock signals to be decreased such that the power consumption drops by approximately 25-30% from the normal active mode.

## BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is a circuit block diagram of the various units of the laptop computer and showing power lines, clock signal lines and control lines pertaining to the power management scheme of the present invention.

7 -

Figure 2 is a circuit schematic diagram showing an example of a transistor switch utilized to control the switching of a clock signal to a given device.

10

5

Figure 3 is a circuit schematic diagram showing an example of a transistor switch utilized to control the switching of power to a given device.

# DETAILED DESCRIPTION OF THE PRESENT INVENTION

A power management system for a laptop computer is described. In the following description, numerous specific details are set forth, such as specific circuits, devices, etc., in order to provide a thorough understanding of the present invention. It will be obvious, however, to one skilled in the art that the present invention may be practiced without these specific details. In other instances, well-known circuits and signal lines have not been described in detail in order not to unnecessarily obscure the present invention.

-8-

Referring to Figure 1, an architecture for a portable computer 10 is shown, including the power manager (PMGR) 11 of the present invention. Although computer 10 can be of a variety of computers, computer 10 of the present invention is a portable computer and, more specifically, a laptop computer which is capable of operating without an external power source.

- Aside from the PMGR 11, computer 10 is comprised of a CPU 12, read-only 15 memory (ROM) 13, random-access memory (RAM) 14, liquid crystal display (LCD) unit 15 which includes a viewing screen and associated video circuitry, crystal controlled clock and oscillator 16, a battery 17, a battery charger circuit 18 and an input/output (I/O) unit 19 which includes an I/O controller 19a and at
- least one I/O device 19b. These components are typically present in most desktop or portable computer systems. Computer 10 of the present invention further includes a disk controller 20, a serial communication controller 21 and its drivers 22, a parallel communications controller 23, sound circuit and drivers 24, and a modem 25. It is to be appreciated that although units 20-25
- are included within computer 10 that these devices are typically a design 25 choice and the computer 10 can readily operate as a functioning computer without the presence of these units.

SANDISK Exhibit 1004, Page 214 of 385

10

5

20

Several additional units are included within computer 10 to operate with the PMGR unit 11. Analog interface unit 26, clock control unit 27 and an internal interface unit, referred to as a via unit 28, are included to function in conjunction with the PMGR 11. It is to be appreciated that units 12-25 are devices used in prior art computers and such description and operation of these units are not included herein. Units 12-25, except for unit 17 and 18, are available with the Macintosh<sup>™</sup> brand computers of Apple Computer Inc., of Cupertino, California.

In functional terms, CPU 12 is the main processing unit for computer 10 and in the preferred embodiment is a 68000 based (part numbers 68000, 68020 and 68030) processor manufactured by Motorola Corporation. ROM 13 is used to store the operating system of the computer 10 as well as other proprietary programs, such as file directory routines. RAM 14 is utilized as the internal memory of the computer for accessing of data. The LCD display 15

- with its associated video circuitry provides for the presentation of a display on a viewing screen. The crystal operated clock 16 provides for the necessary timing reference signals which are needed for the operation of computer 10. The battery 17 powers computer 10, permitting computer 10 to be a fully portable unit. Battery charger circuit 18 monitors the level of the battery 17 as
- 20 well as charging the battery 17 when computer 10 is coupled to an external power source such as 110 Volts AC.

The I/O unit 19 interfaces with various I/O devices, such as keyboards and cursor control devices, such as a "mouse" or a trackball. The disk controller unit 20 is used to access a disk storage medium, such as a floppy

disk. In computer 10, a hard disk is coupled and accessed by the parallel communications controller 23. The serial communication controller 21 and its drivers 22 are utilized to provide serial communication, such as supporting a RS-232 protocol. The sound circuits and drivers of sound unit 24 are utilized to

-9-

generate various audio signals from computer 10. Modem 25 is typically an external device, however, in this instance it is included within computer 10 to provide full modem capability, in order that the portable computer 10 has capabilities of interfacing with telecommunication lines at various remote

5 locations.

10

The power management apparatus of the present invention is comprised of PMGR 11, analog interface unit 26, clock control unit 27 and via unit 28. Functionally, PMGR 11 is an intelligent assistant to the CPU 12, wherein PMGR 11 monitors the state of charge of battery 17, controls the power consumption of the various subsystems, includes a real time clock which frequency is determined by the clock circuit 16, interfaces to the internal modem 25, as well as an interface to the I/O peripheral devices 19b through

I/O controller19a. It is to be appreciated that PMGR 11 of the preferred
embodiment includes its own ROM, RAM, timers, analog to digital converters,
and general purpose I/O lines. Although a variety of devices can be used to
perform the functions of PMGR 11, the preferred embodiment uses part number
50753, which is a semiconductor chip manufactured by Mitsubishi

Corporation.

The software stored within PMGR 11 of the present invention provides for three main functions in controlling the power management of the various devices. These functions are receiving commands from the CPU 12 and performing in response to these commands, controlling the transfer of communications between the PMGR and peripheral units coupled to the I/O controller unit 19, and monitoring the system as well as providing the timer to

25 maintain the real time clock. An 8-bit data bus and two handshake lines provide the coupling between CPU 12 and PMGR 11 through the via unit 28. The 8-bit databus is used to transfer command and data between CPU 12 and PMGR 11. This 8-bit communication is achieved by the use of a two line

-10-
handshaking scheme wherein commands are provided by CPU 12 and replies are provided by PMGR 11 on data and handshake lines 33.

Once the command is sent from CPU 12 through via unit 28 to PMGR 11 and the handshake is completed, PMGR 11 decodes the command and executes it. If no reply data is to be returned, PMGR 11 waits for the handshake for the next command to begin from CPU 12. If reply data is to be returned, PMGR 11 begins the reply handshake and returns the requested data. In the preferred embodiment commands and replies are transmitted in a protocol comprising of a command/reply byte, a count byte and optional data bytes.

5

10 Once every 1/60 of a second (frequency of 60 Hz), the clock oscillator 16 generates an interrupt to PMGR 11 and this interrupt is coupled to CPU 12 on line 34. When this interrupt is generated, PMGR 11 closes the I/O channel from I/O controller 19 and further, will not respond to any handshake requests from CPU 12. The interrupt on line 34 causes CPU 12 to suspend the data

15 transfer to PMGR 11. During this interrupt cycle, PMGR 11 performs its periodic monitoring routines which include updating the real time clock, checking the battery power level and sending an auto poll command. The auto poll command is associated with the auto poll scheme of the preferred embodiment in which the CPU 12, through PMGR 11, automatically

20 interrogates (polls) devices coupled to bus 37 to determine the presence of data for transfer.

PMGR 11 contains the necessary I/O transceiver functions for transfer of information between PMGR 11 and I/O unit 19 on bus 37. Packets of information to be sent on bus 37 to I/O unit 19 are sent by CPU 12 to PMGR 11

25 in the data portion of the command signal. Data received by PMGR 11 from VO controller 19 is buffered internally and once received, this data is stored within PMGR 11 until requested by CPU 12. If a new I/O command was transmitted by CPU 12 during a previous command/execution cycle, the new command and

-11-

its corresponding data is supplied as the next I/O command which is to be sent. If the I/O device has any data to return, PMGR 11 receives, buffers and stores the data. When the data is completely received, PMGR 11 interrupts CPU 12 on interrupt line 34 and CPU 12 responds to the interrupt by determining the source of the interrupt and data is obtained from PMGR 11.

PMGR 11 includes a one second timer which is based on the 60 Hz frequency of clock 16. PMGR 11 also includes its own internal clock which performs as a real time clock. The one second timer is used to supply a wake up timer and create the one second interrupt for triggering the various

- 10 monitoring functions. That is, as each new second is counted within PMGR 11, a number of periodic operations occur. Firstly, the real time clock and the wake up timer (if enabled) are updated. The wake up timer is an internal alarm clock which is used to provide an alarm/signal whenever the real time clock coincides with the tome set for the wake up timer (if enabled). Next, computer
- 10's power system and battery 17 are checked to determine the battery power level and if a low battery condition exists. The battery charger circuit 18 includes means for monitoring the level of the battery and for determining if the power level drops below a predetermined level. Then, the internal temperature is also checked followed by the interrupt to the CPU. Subsequently PMGR 11
  sends any pending I/O transactions to CPU 12.

It is to be appreciated that via unit 28 performs the function of an interface unit between the CPU 12 and PMGR 11. Via unit 28 includes general purpose I/O devices, internal timers, interrupt generators, as well as input and output ports. However, it is to be noted that PMGR 11 can be readily adapted to operate without such a via unit 28 without departing from the spirit and scope of the present invention.

In order to provide the control over the consumption of power by computer 10 for the primary purpose of extending the life of battery 17 when

-12-

5

25

computer 10 is disconnected from an external power source, PMGR 11 provides for a number of control and monitoring functions for this purpose. PMGR 11 is utilized to cause computer 10 to be in one of three separate modes of operation. The three modes are the normal, slow and sleep modes. PMGR 11 responds to each of these modes by controlling the clocking signal being sent to a given device and/or controlling the voltage being supplied to a given unit. The clock signals coupled from the clock oscillator 16 to PMGR 11 are coupled to the clock control unit 27. Clock control unit 27 operates as a switch to couple the various clock signals on lines 41, 42 and 43 to CPU 12, serial communication controller unit 21 and the disk controller unit 20, respectively.

5

10

A power supply 29, which receives its power from battery 17, provides the needed voltages by computer 10. These supply voltages, shown as Vcc's in Figure 1, are coupled through PMGR 11, wherein PMGR 11 provides separate Vcc sources to the various units through the analog interface unit 26.

- 15 As shown in Figure 1, VccA is coupled to the CPU 12 and related units. Three other separate Vcc sources are also provided from PMGR 11 as dedicated Vcc voltages to serial communication drivers 22, sound unit 24 and to the modern 25 through analog interface unit 26. These voltages are designated as VccB, VccC and VccD, respectively. It is to be noted that control lines are
- 20 also present between PMGR 11 and clock control unit 27 and between PMGR 11 and analog interface unit 26. In the preferred embodiment, analog interface unit 26 is comprised of a plurality of transistor switches for switching the various Vcc sources onto their corresponding lines. The clock control unit 27 also includes various switches for coupling the clock signals to the corresponding
- 25 units. Further, it is to be appreciated that PMGR 11 also includes circuitry for the various clocking signals for distribution onto lines 41-43. It is to be noted that PMGR 11 can change the various clocking rates of the clocking signals present on lines 41-43.

- 13 -

In the normal (or wake) mode of operation, computer 10 is fully active and all of the switches within clock control unit 27 and the analog interface unit 26 are closed. However, commands can be provided by CPU 12 automatically in response to stored routines, or in response to a user input through I/O unit 19, to deactivate transistor switches which couple VccB, VccC and VccD, in order to remove the applicable Vcc power from the serial communication controller drivers 22, sound drivers of unit 24 and modem 25. Alternatively, in order to conserve power of the battery, Vcc voltages for powering units 22, 24 and 25 need not be applied until such unit usage is requested by the system or the user.

- 14 -

In order to further conserve power, PMGR 11 will send computer 10 into a sleep (inactive) mode under an occurrence of either of two conditions. When the battery charger circuit 18 notes that battery 17 has dropped to a predetermined level, which level is deemed to be detrimental to further

15 operation of computer 10, PMGR 11 places computer 10 into a sleep mode. PMGR 11 can also enter the sleep mode when a sleep command is provided by CPU 12. CPU sends a sleep command to PMGR 11 when there has been no user activity for a predetermined amount of time or when the user decides to stop work and shut down the computer 10.

Before entering the sleep mode, the operating system of the computer, as well as the various drivers, save the current state information in RAM 14. Thus, the state of the various registers, drivers and other memory devices are stored within RAM 14 for later restoration. Once these necessary states are stored in RAM 14, PMGR 11 releases all of the switches in analog interface unit 26 so that power is removed from the various units of computer 10. It is to be noted that power is removed from RAM 14 if RAM 14 is comprised of nonvolatile memory such as an EPROM, which is the case with the memory device

•14 of the present invention. However, if RAM 14 is comprised of volatile

25

20

5

10

memory then the transistor switch applying Vcc power to RAM 14 is kept
closed so that Vcc is still applied to RAM 14 keeping it active in order to retain the stored information. It is to be noted that non-volatile memory is preferred so that Vcc need not be applied to RAM 14 in the sleep mode. Further, it is to be noted that the preferred embodiment uses CMOS memory.

In an alternative embodiment, VccA can be coupled onto line 45 in order to keep the power supplied to CPU 12. The internal clock of PMGR 11 can be decoupled from CPU 12 by clock control unit 27 thereby disabling the clock input to CPU 12 and halting the execution of the CPU. The CPU internal states are frozen with all CPU internal RAM and control registers remaining intact by halting the execution of the CPU. Halting the execution of CPU 12

typically will lower its power consumption by two orders of magnitude. Although a number of conditions can cause computer 10 to wake from

10

the sleep mode, computer 10 of the present invention has three possible
conditions which triggers it to leave the sleep mode. PMGR 11 continues to
monitor lines 37 such that any input from I/O controller19a will cause computer
10 to wake from the sleep state. The I/O input is typically a pressing of a key on
the keyboard and/or the movement of the cursor control device. The second
condition for waking up computer 10 occurs if the wake up timer (alarm clock)

within PMGR 11 had been enabled and matches the real time clock within
PMGR 11. Upon the activation of the alarm clock, PMGR wakes computer 10
from its sleep state. Finally, the third condition of computer 10 occurs if PMGR
11 was set to monitor the detection of a ring signal from modem 25. If an
incoming signal is received by modem 25, the ring signal is detected by PMGR
11 and causes computer 10 to awake from its sleep state.

Upon waking, computer 10 accesses RAM 14 to retrieve the stored state of the various units for restoring computer 10 to the state it was in prior to entering the sleep mode. Further, upon waking, computer 10 initiates a diagnostic routine for ensuring proper operation of computer 10.

The third mode of operation of computer 10 is known as the slow mode. The slow mode is a condition similar to the active mode, except that the clock rate of the clocking signal to the various units is slowed. That is, by reducing the clock rate of computer 10, as much as 25-30% of power savings can be obtained. Although all of the clocking signals on lines 41-43 can be slowed, it is to be noted that the clock signal on each line can be slowed. Slowing the clock rate of the clocking signal on line 41 to CPU 12 can achieve 25-30% savings in power.

Furthermore, the slow mode is entered from the normal mode when no

activity has been detected after a predetermined time period, this time period being less than the time period for placing the system into the sleep mode. Thus, if no activity occurs for a certain duration, computer 10 enters the slow mode first and if the non-active cycle continues, computer 10 will eventually enter the sleep mode after an additional time period.

15

20

5

10

The slow state can be entered and departed by user command or CPU command. It is appreciated that clock signals to units 20 and 21 can be decoupled by clock control unit 27, wherein units 20 and 21 are deactivated and will not lose the current internal states of those units.

Referring to Figure 2, a transistor switch 50 utilized in the clock control unit 27 is shown. It is to be appreciated that only one switch 50 is shown, however, the actual clock control unit 27 is comprised of a plurality of these switches 50. A clock signal from PMGR 11 is coupled through transistor 51 to

25 its corresponding device 52. The control signal is also obtained from PMGR 11 and is coupled to the gate of the transistor 51. When transistor 51 is made active by the control signal, the clock signal is coupled to device 52. Typically, device 52 is a CMOS device so that when the clock signal is

- 16 -

removed from this CMOS device, the device shuts down and consumes none or very little power. It is to be noted that in some of the devices, such as units 20 and 21, the clock signal can be decoupled from these devices while the Vcc supply to these devices are present.

5

10

Referring to Figure 3, a transistor switch 54 comprising one of the switches within analog interface unit 26 is shown. However, it is to be noted that a plurality of these switches reside within analog interface unit 26. One of the Vcc lines is coupled from PMGR 11 through transistor 55 to device 56. A control line also from PMGR 11 is coupled to the gate of transistor 55 for controlling the coupling of Vcc to device 56 through transistor 55. It is to be noted that power is supplied to device 56 when transistor 55 is made active and that device 56 may not necessarily be a CMOS device since power will be removed from device 56 when transistor 55 is cut off.

It is to be appreciated that the above description in reference to Figures 1-3 can be represented in various other circuit equivalent forms without departing from the spirit and scope of the invention. Further, in reference to Figure 1, the actual devices and the switching of the power and clock signals can be readily adapted to operate with other designs without departing from the spirit and scope of the present invention. However, in order to provide a more detailed workings of the present invention, various specific details pertaining to the preferred embodiment are disclosed below. CPU 12 provides various

commands to PMGR 11 for connecting the Vcc power to applicable devices as needed. Further, clock signals can be either disconnected from various devices, or in the alternative, PMGR 11 can provide different clock speeds,

such as during the slow mode. CPU 12 can be made to provide these commands in response to a stored routine or in response to a monitoring function of the PMGR or in response to a user interaction through I/O unit 19.

- 17 -

It is to be noted that the various drivers of computer 10 are responsible for powering on and off their respective peripheral devices. It is to be noted that drivers of computer 10 can be hardware or software drivers, or a combination thereof, and the preferred embodiment uses software drivers. That

is, software is used to control the powering on and off the respective devices.
Thus, the power to the disk control unit 20 also powers the floppy disk, the power to the parallel communications controller 23 also powers its associated peripheral device, such as the hard disk. The drivers of the serial communications controller 21 and the power to the sound drivers 24 also are controlled as needed. These drivers are responsible for maintaining the time

10 controlled as needed. These drivers are responsible for maintaining the time that these devices are powered to a minimum in order to conserve power. Thus, they are only activated when a given particular device is needed. Generally, each device driver will enable its peripheral device when the driver is needed.

In the case of the floppy disk controller 20, the power is only applied to the peripheral device when an actual disk read or write is under way. Also, in the instance with the modern 25, it is kept without power until a ring is detected by PMGR 11 or when activated by the CPU 12. As stated previously those devices that have system clock inputs are enabled/disabled by controlling their connection to the clock. They can remain powered even though the rest

- of the system is off, therby retaining their internal states, but consuming less power. As such, clock control devices do not need be re-initialized or reenabled when their clock is turned off. Those devices that do not have a clock input or do not require any state to be retain are enabled/disabled by
- 25 controlling their connection to power. As stated previously, the power can be removed from CPU 12 in which case the internal states of CPU 12 are stored in RAM 14 prior to power down. It is to be stressed that the clock input can be removed from CPU 12 in which case the internal states of CPU 12 are retained.

- 18 -

In reference to the battery charger circuit 18, the circuit charges the battery when coupled to an external power source, but circuit 18 is also utilized to monitor battery 17. PMGR 11 monitors the power level of battery 17 and alerts the user when that level drops to a predetermined level, permitting the user to finish the current job of the computer and shutting down the computer prior to complete breakdown of computer 10. An analog-to-digital converter within PMGR11 provides for the conversion of the analog battery voltage to a digital signal. Although not shown in Figure 1, a temperature sensing mechanism is also coupled to a PMGR 11 to sense the temperature and another analog-to-digital converter within PMGR 11 is also used to convert this

analog signal to a digital signal.

15

It is to be appreciated that the PMGR 11 of the preferred embodiment of the present invention provides for a variety of techniques to monitor and control the distribution of power and clocking signals in order to conserve the time that computer 10 can be self-sustaining when decoupled from an external power source.

- 19 -

#### **CLAIMS**

1. In a portable computer, having a central processing unit (CPU), a memory, a plurality of peripheral devices including a user interactive device, and a battery for powering said computer, an apparatus for managing the use of power from said battery by said computer, comprising:

- -20-

CPU and also coupled to receive inputs from said user interactive device;

said control means also coupled to said battery for controlling distribution of said power to various units of said computer;

said control means also coupled to provide an internal clock and distributing a clock signal to some of said units of said computer;

first switching means coupled to said control means for distributing said power to some of said various units, said first switching means including first switches for switching said power, said first switches being controlled by said control means;

second switching means coupled to said control means for distributing said clock signals to some of said units, said second switching means including second switches for switching said clock signal, said second switches being controlled by said control means.

2. The apparatus of Claim 1, wherein said first switching means decouples power from each of said variuous units coupled to said first switching means until each of said respective units are needed to be accessed by said CPU.

3. The apparatus of Claim 2, wherein said second switching means decouples said clock signal from each of various units coupled to said second switching means until each of said respective units are needed to be accessed by said CPU.

4. The apparatus of Claim 3, wherein said control means provides for three modes of operation, a first mode for providing power and clock signals to said various units when needed by said computer, a second mode for removing power or clock signal to deactivate respective devices to conserve power, and a third state in which the frequency of said clock signal is reduced in order to reduce power consumption to those units coupled to receive said clock signal.

5. In a portable computer, having a central processing unit (CPU), a memory, a plurality of peripheral devices including a user interactive device, and a battery for powering said computer, an apparatus for managing the use of power from said battery by said computer, comprising:

control means coupled to said CPU for receiving commands from said CPU and also coupled to receive inputs from said user interactive device;

said control means also coupled to said battery for controlling distribution of said power to various units of said computer;

said control means also coupled to provide an internal clock and distributing a clock signal to some of said units of said computer;

said control means providing for three modes of operation of said computer, an active mode for providing active operation of said computer, a sleep mode for placing said computer in an inactive state to conserve power and a slow mode in which the frequency of said clock signal is reduced in

SANDISK Exhibit 1004, Page 227 of 385

- 21 -

2

order to reduce power consumption to those units coupled to receive said clock signal:

- 22-

first switching means coupled to said control means for distributing said power to some of said various units, said first switching means including first switches for switching said power, said first switches being controlled by said control means;

second switching means coupled to said control means for distributing said clock signals to some of said units, said second switching means including second switches for switching said clock signal, said second switches being controlled by said control means;

monitoring means for monitoring said various units and providing information of monitored units to said control means.

6. The apparatus of Claim 5, wherein said first switching means decouples power from each of said variuous units coupled to said first switching means until each of said respective units are needed to be accessed by said CPU.

7. The apparatus of Claim 6, wherein said second switching means decouples said clock signal from each of various units coupled to said second switching means until each of said respective units are needed to be accessed by said CPU.

8. The apparatus of Claim 7, wherein prior to entering said sleep mode said apparatus stores CPU states in said memory and retrives said CPU states from said memory when reactivated to said active mode. 9. The apparatus of Claim 8, wherein said computer enters its sleep mode if an input from an input/output (I/O) device does not occur for a first predetermined time period.

10. The apparatus of Claim 9, wherein said monitoring means monitors said I/O device and causes said computer to leave its sleep mode if an input is sensed from said I/O device.

11. The apparatus of Claim 10, wherein said computer enters its slow mode if said input from said I/O device does not occur for a second predetermined time period, said second predetermined time period being shorter than said first predetermined time period.

12. The apparatus of Claim 11, wherein said monitoring means monitors said I/O device and causes said computer to leave its sleep mode if an input is sensed from a modem coupled to said control means.

13. The apparatus of Claim 12, wherein said I/O device is said user interactive device.

14. The apparatus of Claim 10, wherein said first and second switches are field-effect transistors.

15. The apparatus of Claim 14 further including a reference clock means coupled to said control means for providing a crystal controlled reference clock signal.

ş

16. In a portable computer, having a central processing unit (CPU), a memory, a plurality of peripheral devices including a user interactive device, and a battery for powering said computer, an apparatus for managing the use of power from said battery by said computer, substantially as hereinbefore described with reference to the accompanying drawings.

(54) Title: PERSONAL COMPUTER CARD RADIO MODEM USING NON-STANDARD POWER OUTPUT LEVEL

0 02/07494 (57) Abstract: A hand-held, PCMCIA cellular radio modem card is described which uses a non-standard power output level. The non-standard power output is defined as the maximum RF power attainable such that the current drawn by the power amplifier does not exceed 400 mA. This definition permits the use of the wireless modem inside hand-held computing devices without the use of an additional battery pack extension.

(10) International Publication Number

PCT/CA01/00629

## PERSONAL COMPUTER CARD RADIO MODEM USING NON-STANDARD POWER OUTPUT LEVEL

#### **Background of the Invention**

The present invention relates to personal computer (PC) card radio modems.

- 5 Small hand-held personal computing devices can use Personal Computer Memory Card Interface Association (PCMCIA) radio modems to connect to a wireless network. PC card radio modems typically use battery power from the hand-held PC or from a battery pack extension.
- A problem that exists in prior-art systems in which the wireless modem operates on a network such as the North American AMPS or CDPD network, is a battery pack extension is used to supplement the power supplied to the wireless modem. Typically, hand-held PCs use two AA batteries, which suffer from low capacity and a low peak current capability.

Six different standard RF power levels are required by the CDPD standard

15 (CDPD R1.1 Part 409) and the AMPS standard (IS-19B) for a class III cellular device. With two AA batteries supplying the hand-held PC and the PCMCIA wireless card, it is difficult to achieve the highest RF power level; which, for a class III cellular device, is an output power of 28 dBm where 0 dBm is 1mW output power. Typically, prior art uses a battery pack extension on the PCMCIA card to achieve the highest RF power output.

20 This is an undesirable solution as the esthetics of the complete product are poor.

It is desirable to have an improved system, which avoids some of the problems of the prior art.

#### **Summary of the Invention**

In one embodiment, the present invention relates to a PC card radio transceiver which uses a non-standard power output level. The non-standard power output level is limited by the peak sustainable current available from the battery inside the hand-held PC. In one embodiment, this current is limited to 600 mA. The non-standard RF power WO 02/07494

obtainable, given a 600mA maximum limit, is typically between 24 dBm and 28 dBm (in one implementation, 26.5 dBm). The non-standard power output level has a nominal value less than the nominal value required by the standard, yet is still within the acceptable range (+2, -4dB) specified in the standard.

5

The advantage of the present invention is that the radio transceiver in the PC card can operate while attached to a hand-held PC without requiring a battery pack extension. The system allows the two AA batteries of the hand-held PC to produce an acceptable, high-level RF output power.

Implementation of a non-standard RF power level, which is based on a current restriction, requires the automatic leveling circuit (ALC) of the power amplifier to be a current leveling circuit as opposed to a power leveling circuit as in prior art systems. A current leveling circuit achieves the same effect as a power leveling circuit, given the load on the power amplifier remains constant. In practice, this is a reasonable assumption.

15

#### **Brief Description of the Drawings**

Fig. 1 is a block diagram illustrating a PCMCIA cellular modem attached to a hand-held PC.

Fig. 2 is a diagram illustrating the power amplifier, current leveling circuit,
duplexer and antenna used in the PC card cellular radio transceiver of one embodiment of the present invention.

Fig. 3 is a diagram illustrating both the implemented and non-implemented standard power output levels as well as the non-standard power output level of one embodiment of the present invention.

25

Fig. 4 is a block diagram illustrating one embodiment of the current leveling system of the present invention.

Fig. 5 is a schematic illustrating one embodiment of the current leveling circuit for one embodiment of the present invention.

٠.

-3-

#### **Detailed Description of the Preferred Embodiment**

Fig. 1 is a block diagram that illustrates a hand-held personal computer 20 and PC card 22. In one embodiment, the PC card is a cellular modem with a built-in radio transceiver.

5

The hand-held PC 20 sends signals to be transmitted to the PC card cellular modem 22. Additionally, the hand-held PC supplies power for the operation of the PC card cellular modem 22. Typically, two AA batteries in the hand-held PC power both the hand-held PC and the PC card cellular modem 22. Since relatively small batteries are used, the maximum current which can be drawn by the PC card cellular modem 22 is

- 10 limited to less than what is needed to meet the nominal output power requirements of IS-19B and CDPD Part 409 standards given present power amplifier and duplexer technologies. In one embodiment, the PC card cellular modem 22 should not draw more than 600 mA of current.
- Fig. 2 is a simplified diagram of the elements in the PC card cellular modem of one embodiment of the present invention. A current leveling circuit 32 controls the current supplied to power amplifier 30 and hence indirectly controls the output power of amplifier 30. In a PC card cellular modem, the current supplied to the power amplifier makes up a large percentage of the total current consumed by the device. The output of the power amplifier 30 is sent to a duplexer 34, then out the antenna 36.
- 20 In the present invention, the current leveling circuit 32 limits the current used by the power amplifier 30 at the highest power output level. This highest power output level is the non-standard power output level described below.

In one embodiment, the current leveling circuit 32 limits the current drawn by the power amplifier 30 to 400 mA when it is transmitting at the highest output power level. The current consumption of the entire card is therefore limited to 600mA.

Fig. 3 illustrates the RF output levels for the standard and non-standard power outputs for CDPD standard R.1.1 Part 409 and AMPS standard IS-19B. There are six standard output power levels for a class III cellular device. The standard, nominal power WO 02/07494

-4-

output levels range from 8 to 28 dBm in 4 dB steps. In one embodiment, the nonstandard power output level is between the highest standard power level, which is not implemented (28 dBm), and the highest implemented power level (24 dBm). In one embodiment, by limiting the current draw by the power amplifier to 400 mA or less (the total PC card current draw to 600mA or less), the non-standard power output level is about 26.5 dBm. This level is below the nominal 28 dBm power level specified in the standard, yet still falls within the acceptable range of +2dB to -4dB from nominal specified in the standard.

Fig. 4 is a block diagram of a circuit to implement one embodiment of the present invention. A set point value 48 is sent to adder 40 and combined with a feedback 10 value on line 44 from current-sensor 42 to produce a gate bias (power control) signal for power amplifier 46. The set point values are controlled by the micro-processor. Each set point value corresponds to a power output level for the power amplifier 46. The current leveling circuit limits the power output by the power amplifier. In a preferred embodiment, the maximum set point value is such that the current drawn by the power amplifier is less than 400 mA.

Fig. 5 illustrates details of one embodiment of the current leveling circuitry for operation with the PC card radio transceiver of the present invention.

Other modifications and implementations will occur to those skilled in the art, 20 without departing from the spirit and scope of the present invention. Accordingly, the above description is not intended to limit the invention, which is to be limited only by the following claims.

5

-5-

Claims:

5

1. A PC radio card adapted to be connected to and powered by a hand-held personal computer, the PC radio card using a number of output power levels controlled by current supplied to power amplifier in the PC radio card, the output power levels including multiple implemented standard power output levels and a nonstandard batterylimited power output level, the nonstandard battery-limited power output level being greater than the multiple implemented standard power output levels but less than an unimplemented standard power output level.

The PC radio card of Claim 1 wherein the non-standard battery-limited
 power output level is such that the current drawn by the power amplifier is 400 mA or less.

3. The PC radio card of Claim 1 wherein the PC radio card includes a current control automatic leveling circuit, keeping the current supplied to the power amplifier less than 400 mA.

15 4. The PC radio card of Claim 1 wherein the PC radio card is powered by a hand-held personal computer using two AA batteries.

5. The PC radio card of Claim 1 wherein the non-standard battery-limited power output level is less than 28 dBm and more than 24 dBm, wherein an output of 0 dBm is calibrated to 1 mW of output power.

20 6. A PC radio card adapted to be connected to and powered by a hand held personal computer, the PC radio card using a number of output power levels set by current supplied to power amplifier in the PC radio card, the output power levels including multiple implemented standard power output levels and a nonstandard battery-

SANDISK Exhibit 1004, Page 237 of 385

1

5

limited power output level, the nonstandard battery-limited power output level being such that the current drawn by the power amplifier is 400mA or less.

7. The PC radio card of Claim 6 wherein the non-standard battery-limited power output level is greater than the implemented standard but less than an unimplemented standard power output level.

8. The PC radio card of Claim 6 wherein the PC radio card is powered by a hand-held personal computer using two AA batteries.

9. The PC radio card of Claim 6 wherein the PC radio card has a current controlled automatic leveling circuit to limit the current supplied to the power amplifier.

10 10. The PC radio card of Claim 6 wherein the non-standard battery-limited power output level is less than 28 dBm and more than 24 dBm when 0 dBm is calibrated to one mW of output power.

11. A system including:

a battery-powered hand held personal computer; and

15 a PC radio card connected to and powered by the hand held personal computer, the PC radio card using a number of output power levels set by current supplied to power amplifier in the PC radio card, the output power levels including multiple implemented standard power output levels and a nonstandard battery-limited power output level, the nonstandard battery-limited power output level being greater than the multiple

20 implemented standard power output levels but less than an unimplemented standard power output level.

12. The system of Claim 11 wherein the nonstandard battery-limited power level is such that the current drawn by the power amplifier is 400 mA or less.

13. The system of Claim 11 wherein the hand-held personal computer is powered two AA batteries

14. The system of Claim 11 wherein the nonstandard battery-limited power level limits the current supplied by the hand-held personal computer to the PC radio card
5 to less than a given amount.

15. The system of Claim 11 further comprising a current controlled automatic leveling curcuit in the PC radio card to limit the current supplied to the power amplifier.

16. A PC card transceiver including: an antenna;

10

15

an amplifier operably connected to the antenna:

a current controller operably connected to the amplifier to set the power output of the transceiver, the current controller adapted to produce a number of standard transceiver power output levels and a nonstandard transceiver output power level, the nonstandard transceiver output power level being such that the amplifier current is at a level that makes efficient use of the PC card transceiver batteries.

17. The PC card of Claim 16, further comprising a duplexer operatively positioned between the amplifier and the antenna.

18. The PC card of Claim 16 wherein the non-standard battery-limited power output level is greater than the implemented standard but less than an unimplemented
20 standard power output level.

19. The PC card transceiver of Claim 16 wherein the amplifier is limited to 400 mA of current draw.

•

4

20. The PC card transceiver of Claim 16 wherein the PC card transceiver is adapted to be powered by a hand-held personal computer.

SANDISK Exhibit 1004, Page 247 of 385

#### **DETAILED ACTION**

Examiner acknowledges preliminary amendments filed on 26 March 2003. The present office action is based on the claims and specification as amended.

#### Priority

Acknowledgment is made of applicant's claim for foreign priority under 35 U.S.C. 119(a)-

(d). The certified copy has been filed in parent Application No. 20020594, (Finnish Patent

Application), filed on 27 March 2002.

#### Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 2, 4, 8, 10, 12, 13, 17, and 24 are rejected under 35 U.S.C. 112, second

paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Regarding claim 2, applicant has used the word "substantially" in line 5 to describe the difference in degree between a power consumption setting and a first maximum limit. The usage of "substantially" does not unambiguously limit the scope of applicant's claims. Claims 4, 8, 10, 13, 17, and 24 are also rejected on this basis.

In addition, claim 2 recites the limitation "said first maximum limit" in line 5. There is insufficient antecedent basis for this limitation in the claim. It is noted that applicant has replaced all references to a "maximum limit" with a "maximum value." Claim 17 is also rejected on this basis.

Claim 12 recites the limitation "the bus width" in line 4. There is insufficient antecedent

basis for this limitation in the claim. Applicant has not previously recited a bus width in the claim

or its parent.

### Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the

basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-5, 9, 10, and 14-21, are rejected under 35 U.S.C. 102(b) as being anticipated

by Amoni et al., U.S. Patent No. 5,884,086<sup>1</sup> (claims 1, 2, 4, 9, 10, 16, 17, and 20), and

Robinson, U.S. Patent No. 5,532,945 (claims 1, 3, 9, 16, and 20).

Claims 1, 9, 14-16, and 18-20 are rejected under 35 U.S.C. 102(e) as being anticipated

by McKeen et al., U.S. Patent No. 6,785,830<sup>2</sup>.

Regarding claim 1, each of Amoni, Robinson, and McKeen teaches:

a method for determining the power consumption in an electronic device, to which a

peripheral device is connected, to which the power is supplied from the electronic device

<sup>&</sup>lt;sup>1</sup> Applicant-cited reference.

<sup>&</sup>lt;sup>2</sup> U.S. issued patent of applicant-cited reference, WO 02/07494 A2.

[Amoni, col. 2, lines 32-44, Fig. 6A/6B, Robinson, Fig. 6], wherein the method comprising determining, for the power consumption, at least a first maximum value [Amoni, Fig. 6A, step 611, Robinson, Fig. 6, step 130, col. 11, lines 31-34] and a second maximum value [Amoni, Fig. 6, step 619, max threshold, Robinson, Fig. 6, step 132, peak power] which is higher than the first maximum value, and performing, between the electronic device and the peripheral device, setting of a maximum for the power consumption of the peripheral device to a value which is between said first and second maximum values [Amoni, Fig. 6, step 625, Robinson, Fig. 6, step 136, reduced power, McKeen, col. 1, lines 39-50].

Regarding claim 2, Amoni teaches:

the method according to claim 1, wherein said first maximum value is used as a default value for the power consumption, wherein the power consumption of the peripheral device is set, at the startup stage, to be substantially not higher than said first maximum value [col. 8, lines 19-22].

Regarding claim 3, Robinson teaches:

the method according to claim 1, wherein said second maximum value is used as the highest allowable value for the power consumption [Fig. 6, step 132, peak power].

Regarding claim 4, Amoni teaches:

the method according to claim 1, wherein messages are transferred between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum limit and said second maximum limit [col. 6, line 32ff, "Auxiliary Power Communication Protocol"].

Regarding claim 5, Robinson teaches:

the method according to claim 1, wherein at least one content is stored in the peripheral device, to be used in connection with the electronic device, wherein at the stage of storing the

content, the power consumption set for the peripheral device is a value corresponding to said second maximum limit, and at the stage of using the content, the power consumption set for the peripheral device is a value corresponding to said first maximum limit [col. 1, line 67 to col. 2, line 3].

Regarding claims 9, 10, 16, 17, and 20, Amoni teaches the method of claims 1 and 4. Amoni also teaches the system, the electronic device, and the peripheral device to implement the claimed method.

Regarding claims 14, 15, 18, and 19, McKeen teaches the method of claim 1. McKeen also teaches the system and the electronic device to implement the claimed method, as recited in claims 9 and 16. McKeen also teaches that the electronic device is portable and comprises a means for performing mobile stations functions [hand-held PC and PC card radio transceiver, col. 1, lines 39-44].

Regarding claim 21, Robinson teaches the method of claims 1 and 5. Robinson also teaches the peripheral device recited in claim 20 and the storage of content recited in claim 21.

#### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 6, 11, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Amoni in view of Yonezu et al., U.S. Patent No. 4,841,440<sup>3</sup>.

Regarding claims 6, 11, and 22, Amoni teaches that a clock signal is generated in the device, but does not teach that the power consumption is controlled by adjusting the frequency of the clock signal.

Yonezu teaches that power consumption may be reduced by inhibiting a control clock signal for a peripheral device [abstract].

It would have been obvious to one of ordinary skill in the art to modify Amoni using the teachings of Yonezu. Both Amoni and Yonezu disclose methods of power control for peripheral devices. The addition of Yonezu's teaching would improve Amoni by providing a way to reduce power consumption.

Claims 7, 12, and 23 rejected under 35 U.S.C. 103(a) as being unpatentable over Amoni in view of Gupta et al., U.S. Patent No. 5,996,083.

Regarding claims 7, 12, and 23, Amoni teaches that the peripheral device comprises a bus, but does not teach controlling power consumption by controlling a width of the bus.

Gupta teaches a technique wherein power consumption in a processor is reduced by changing the width of a bus [col. 9, lines 21-32].

It would have been obvious to one of ordinary skill in the art to modify Amoni by providing a capability to modify the bus width, as taught by Gupta. The teachings of Gupta would improve the system of Amoni by reducing the number of data lines driven on the bus, thus reducing the overall power consumption.

<sup>&</sup>lt;sup>3</sup> Applicant-cited reference.
Claims 8, 13, and 24-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson in view of Holder, Jr., U.S. Patent No. 5,892,729.

Regarding claims 8, 13, and 24, Robinson teaches that the peripheral device comprises one or more storage blocks, but does not teach the controlling of the number of storage blocks processed.

Holder teaches a memory comprising multiple storage banks which may be selectively activated [col. 3, lines 21-32].

It would have been obvious to one of ordinary skill in the art to modify Robinson by providing selectable memory banks, as taught by Holder. The teachings of Holder would improve the system of Robinson by providing selectable memory banks so as to reduce power consumption.

Regarding claim 25, it would have been obvious to one of ordinary skill in the art to store the first and second maximum values in the peripheral device.

Regarding claim 26, it would have been obvious to one of ordinary skill in the art to apply the teachings of Robinson to a multimedia card peripheral device.

## Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure:

Schmutz, U.S. Patent No. 6,477,388 B1; Fung, U.S. Patent No. 6,859,882 B2.

Sir:

In response to the Office Action of September 22, 2005, applicant respectfully

requests reconsideration of the rejections of the claims of the above-referenced patent

application in view of the following amendments and remarks. Please amend the

application as follows.

#### CERTIFICATE OF MAILING

I hereby certify that this correspondence is being deposited with the United States Postal Service on the date shown below with sufficient postage as first class mail in an envelope addressed to Mail Stop Amendment, the Commissioner for Patenta, P.O. Box 1450, Alexandria, VA 22313-1450

Kelly Juglio \_\_\_\_\_\_ KellyPuglio \_\_\_\_\_\_ Dated:\_\_\_\_\_\_\_\_\_\_\_

## IN THE CLAIMS:

1. (Currently Amended) A method for determining power consumption in an electronic device, to which a peripheral device is connected, to which the power is supplied from the electronic device, wherein the method comprising comprises determining, for the power consumption, at least a first maximum value and a second maximum value which is higher than the first maximum value, and performing, between the electronic device and the peripheral device, setting of a maximum for the power consumption of the peripheral device to a value which is between said first and second maximum values.

2. (Currently Amended) The method according to claim 1, wherein said first maximum value is used as a default value for the power consumption, wherein the power consumption of the peripheral device is set, at a startup stage, to be substantially not higher than said first maximum limit value.

3. (Previously Presented) The method according to claim 1, wherein said second maximum value is used as a highest allowable value for the power consumption.

4. (Previously Presented) The method according to claim 1, wherein messages are transferred between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum value and said second maximum value.

5. (Previously Presented) The method according to claim 1, wherein at least one content is stored in the peripheral device, for use in connection with the electronic device, wherein at a stage of storing the content, the power

consumption set for the peripheral device is a value corresponding to said second maximum value, and at a stage of using the content, the power consumption set for the peripheral device is a value corresponding to said first maximum value.

6. (Previously Presented) The method according to the claim 1, wherein at least one clock signal is generated in the peripheral device and wherein the power consumption of the peripheral device is controlled by adjusting the frequency of at least one clock signal.

7. (Previously Presented) The method according to the claim 1, wherein the peripheral device comprises at least one bus and that the power consumption of the peripheral device is controlled by controlling a width of said bus.

8. (Previously Presented) The method according to the claim 1, wherein the peripheral device is provided with two or more storage blocks (2) controlled by controlling a number of storage blocks processed by the peripheral device substantially simultaneously.

9. (Previously Presented) A system comprising an electronic device with means for connecting a peripheral device and means for supplying power to the peripheral device, and which system comprises means for determining power consumption, wherein at least a first maximum value and a second maximum value which is higher than the first maximum value are defined for the power consumption, and wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is between said first maximum value and second maximum value.

10. (Previously Presented) The system according to claim 9, comprising means for transferring messages between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum value and said second maximum value.

•

11. (Previously Presented) The system according to claim 9, wherein the peripheral device comprises means for generating at least one clock signal, and wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting the frequency of said at least one clock signal.

12. (Currently Amended) The system according to claim 9, wherein the peripheral device comprises at least one bus, and wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting the bus <u>a bus</u> width of the peripheral device.

13. (Previously Presented) The method according to the claim 9, wherein the peripheral device is provided with two or more storage blocks, and wherein the means for controlling the power consumption of the peripheral device comprise means for adjusting a number of storage blocks processed by the peripheral device substantially simultaneously.

14. (Previously Presented) The system according to the claim 9, wherein the electronic device is a portable electronic device .

15. (Original) The system according to claim 14, comprising means for performing mobile station functions.

16. (Previously Presented) An electronic device provided with means for connecting a peripheral device and means for supplying power to the peripheral device, and means for determining power consumption, wherein at least a first maximum value and a second maximum value which is higher than the first maximum value are defined for the power consumption, and wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is between said first maximum value and said second maximum value.

17. (Currently Amended) The electronic device according to claim 16, comprising means for transmitting messages from the peripheral device and for receiving messages to the peripheral device, to set power consumption of the peripheral device to a value substantially between said first maximum limit value and said second maximum limit value.

18. (Previously Presented) The electronic device according to claim 16, wherein it is a portable electronic device.

19. (Original) The electronic device according to claim 18, comprising means for performing mobile station functions.

20. (Previously Presented) A peripheral device provided with means for connecting the peripheral device to an electronic device for supplying power to the peripheral device, wherein at least a first maximum value and a second maximum value which is higher than the first maximum value, are defined for power consumption, and wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which

is between said first maximum value and said second maximum value.

.

21. (Previously Presented) The peripheral device according to claim 20, wherein at least one content is stored in the peripheral device for use in connection with the electronic device.

22. (Previously Presented) The peripheral device according to claim 20, comprising means for generating at least one clock signal and means for controlling the power consumption of the peripheral device by frequency control of said at least one clock signal.

23. (Previously Presented) The peripheral device according to claim 20, comprising at least one bus and means for controlling the power consumption of the peripheral device by controlling a bus width of said bus of the peripheral device.

24. (Previously Presented) The peripheral device according to the claim 20, wherein the peripheral device is provided with two or more storage blocks, and that the means for controlling the power consumption of the peripheral device comprise means for controlling a number of storage blocks processed by the peripheral device substantially simultaneously.

25. (Previously Presented) The peripheral device according to the claim 20, wherein said first maximum value and said second maximum value are stored in the peripheral device.

26. (Previously Presented) The peripheral device according to the claim 20, wherein said peripheral device is a MultiMediaCard<sup>™</sup> peripheral device.

#### **REMARKS**

Claims 1-26 are pending. The independent claims are claims 1, 9, 16, and 20. All claims are rejected.

#### The Word "Substantially" is Not Indefinite

Claims 2, 4, 8, 10, 12, 13, 17, and 24 are rejected under 35 U.S.C. § 112 because the Office Action asserts that "usage of 'substantially' does not unambiguously limit the scope of applicant's claims." Applicant respectfully refers to MPEP § 2173.05(b)(D) which states that the term "substantially" is often used in a claim without rendering the claim indefinite. Applicant therefore traverses these indefiniteness rejections., for the reasons provided at MPEP § 2173.05(b)(D).

## The Independent Claims are not Anticipated by the Cited Prior Art

Independent claims 1, 9, 16, and 20 are rejected as anticipated under 35 U.S.C. 102 by *Amoni* (U.S. Patent No. 5,884,086), and also *Robinson* (U.S. Patent No. 5,532,945), and also *McKeen* (U.S. Patent No. 6,785,830).

*Amoni* discloses a system and a method for supplying power to a peripheral device in a computer system. According to *Amoni*, the peripheral device instructs the main device to provide the necessary power to the peripheral device. The power level is not adjusted (handshaked) but the peripheral device is supplied with the power level it needs. In the main device there are switches for selecting a certain, fixed power level (col. 2, lines 40—44). The *Amoni* document does not mention anything about a maximum level, nor does it mention anything about using a certain value for the power level which is less than or equal to a maximum value. Moreover, the *Amoni* 

document does not teach anything about adjusting the power level to a value which is between two different maximum values.

*McKeen* discloses a radio modem card which is intended to be used in connection with a portable PC device. The maximum transmission power of the radio modem card is adjusted to a value which is between two different power levels defined in a standard of a mobile communication system. The maximum transmission power is within allowed tolerances. The limitation of the transmission power is implemented so that the maximum current consumption of the power amplifier of the radio modem card is limited to a certain maximum value. This maximum value is defined in such a way that the total current consumption of the radio modem card does not exceed a predetermined value. The aim of this arrangement is to prevent the radio modem card from overloading the PC device from which the power is supplied to the radio modem card. This is necessary because, according to the example disclosed in *McKeen*, batteries are used as the power source of the PC device and the current which can be supplied from the batteries is limited.

*McKeen* discloses the limitation of the transmission power between two standard values. This non-standard transmission power level is defined on the basis of how much power the power source of the PC device can supply to the radio modem card. The non-standard power level is thus set to such value which allows the use of the maximum available current from the PC device. Therefore, a separate power source is not needed in the radio modem card to enable the use of the maximum transmission power of the radio modem card.

The solution of *McKeen* is quite different from the solution of the present claimed invention. In the present application, at least a first and a second maximum

values are defined for the power consumption, and the maximum of the power consumption is set to a value which is substantially between said first and second maximum value. In the system of *McKeen* the portable PC device does not affect the adjustment of the transmission power of the radio modem card. In other words, in the system of *McKeen* no actions are taken between the PC device and the radio modem card to set the power consumption of the radio modem card. This means that the radio modem card always sets its power consumption to a certain value independent of the device to which the radio modem card is connected. Further, the adjustment of the transmission power and the adjustment of the power consumption are not the same issue. The adjustment of the transmission power determines how much power can be transmitted from the card and the adjustment of the power source. The standard maximum power levels for the transmission power do not determine any limits for the power consumption of the card.

The Applicant also respectfully points out that the limitation of the transmission power of power amplifier of the radio modem card does not directly limit the power consumption of the radio modem card. It may happen that although the transmission power is limited, the power consumption of the radio modem card may still vary due to alterations in the power consumption of other electronics of the radio modem card. In the solution disclosed by *Robinson*, a "power resource table" stored at the host is used, which table is updated and it can be read by the card.

On page 6 of the Office Action, several dependent claims are rejected in view of *Yonezu* (US Patent No. 4,841,440), or in view of *Gupta* (U.S. Patent No.

5,996,083), or in view of *Holder* (U.S. Patent No. 5,892,729). *Yonezu* discloses a solution where the idle/standby power consumption is controlled to the minimum. *Holder* discloses power consumption by controlling the clock connecting to different integrated circuits. *Gupta* also discloses a solution which seems to comprise two-way handshakes. There is a register on the host side, according to which the external device controls its function (the document mentions controlling the bandwidth as one way to decrease power consumption if the host register indicates a smaller maximum consumption than what is required for the external device).

Because all of the present independent claims should be allowable, the claims depending therefrom should also be allowable, notwithstanding *Yonezu, Gupta, and Holder*.

#### **Further Comments About the Present Application**

The invention of the present application provides an improved method and system for determining the power consumption to be suitable in each situation. The invention is based on the idea that at least a first and a second maximum value are determined for the power consumption, wherein the electronic device and the peripheral device set the power consumption to a value between these first and second maximum values. Thus, in different operating situations, for example the peripheral device can adjust its power consumption to be suitable for the situation.

By the method according to the invention, it is possible to avoid the use of an unnecessarily large regulator in an electronic device, which saves costs, and wherein the size of the electronic device can, in some cases, be reduced and, on the other hand, problems of heating caused by high power consumption can be avoided. Also

the power consumption can be reduced, which is advantageous particularly in portable devices. By means of the invention, the peripheral device connection can also be provided with flexibility, because the power consumption of the peripheral device can be adjusted and set to a value suitable for each situation of use. Furthermore, the invention makes it possible that new peripheral devices to be developed will function in connection with electronic devices made earlier, and existing peripheral devices will function in connection with new electronic devices to be developed. None of these advantages can be achieved by the cited references.

## **CONCLUSION**

Thus, the Examiner is asked to kindly reconsider the Office Action in the light of the arguments presented herein, and to correspondingly issue a favorable Office Action at the next stage of the proceedings. The present amendments raise no new issues, and introduce no new matter.

Early allowance of all independent claims (and the pending claims depending therefrom) is earnestly solicited. Applicant would be grateful if the Examiner would please contact Applicant's attorney by telephone if the Examiner detects anything in the present response that might impede a speedy allowance.

## Attorney Docket No. 915-005.048 Serial No. 10/401,338

## **EXTENSION OF TERM**

NOTE: "Extension of Time in Patent Cases (Supplement Amendments) - If a timely and complete response has been filed after a Non-Final Office Action, an extension of time is not required to permit filing and/or entry of an additional amendment after expiration of the shortened statutory period.

If a timely response has been filed after a Final Office Action, an extension of time is required to permit filing and/or entry of a Notice of Appeal or filing and/or entry of an additional amendment after expiration of the shortened statutory period unless the timely-filed response placed the application in condition for allowance. Of course, if a Notice of Appeal has been filed within the shortened statutory period, the period has ceased to run." Notice of December 10, 1985 (1061 O.G. 34-35).

- NOTE: See 37 C.F.R. §1.645 for extensions of time in interference proceedings, and 37 C.F.R. §1.550(c) for extensions of time in reexamination proceedings.
- 3. The proceedings herein are for a patent application and the provisions of 37 C.F.R. §1.136 apply.

(complete (a) or (b), as applicable)

(a) □ Applicant petitions for an extension of time under 37 C.F.R. §1.136 (fees: 37 C.F.R. §1.17(a)(1)-(4)) for the total number of months checked below:

Extension (months)	Fee for other than small entity	Fee for <u>small entity</u>	
<ul> <li>□ one month</li> <li>□ two months</li> <li>□ three months</li> <li>□ four months</li> </ul>	\$ 120.00 \$ 450.00 \$1,020.00 \$1,590.00	\$ 60.00 \$225.00 \$510.00 \$795.00	

Fee: \$

If an additional extension of time is required, please consider this a petition therefor.

(check and complete the next item, if applicable)

An extension for \_\_\_\_\_ months has already been secured. The fee paid therefor of \$\_\_\_\_\_\_ is deducted from the total fee due for the total months of extension now requested.

Extension fee due with this request \$\_\_\_\_\_

OR

(b) Applicant believes that no extension of term is required. However, this conditional petition is being made to provide for the possibility that applicant has inadvertently overlooked the need for a petition for extension of time.

(Amendment Transmittal [9-19] - page 2 of 4)

## **FEE FOR CLAIMS**

4. The fee for claims (37 C.F.R. §1.16(b)-(d)) has been calculated as shown below:

WARNING: "After final rejection or action (\$1.113) amendments may be made cancelling claims or complying with any requirement of form which has been made." 37 C.F.R. \$1.116(a) (emphasis added).

(complete (c) or (d), as applicable)

(c)  $\boxtimes$  No additional fee for claims is required.

## OR

(d) Total additional fee for claims required is \$\_\_\_\_\_.

## FEE PAYMENT

5.  $\Box$  Attached is a check in the sum of \$\_\_\_\_\_.

Charge Account No. \_\_\_\_\_ the sum of \$\_\_\_\_\_. A duplicate of this transmittal is attached.

(Amendment Transmittal [9-19] - page 3 of 4)

## FEE DEFICIENCY

NOTE: If there is a fee deficiency and there is no authorization to charge an account, additional fees are necessary to cover the additional time consumed in making up the original deficiency. If the maximum six-month period has expired before the deficiency is noted and corrected, the application is held abandoned. In those instances where authorization to charge is included, processing delays are encountered in returning the papers to the PTO Finance Branch in order to apply these charges prior to action on the cases. Authorization to charge the deposit account for any fee deficiency should be checked. See the Notice of April 7, 1986 (1065 O.G. 31-33).

6. If any additional extension and/or fee is required, charge Account No. 23-0442.

## AND/OR

If any additional fee for claims is required, charge Account No. 23-0442.

den 7. Hr

## DETAILED ACTION

#### Response to Arguments

Applicant's arguments filed 27 December 2005 have been fully considered but they are not persuasive.

#### Rejections based on 35 U.S.C. 112:

Regarding claims 2, 4, 8, 10, 12, 13, 17, and 24, applicant has argued that the word "substantially" does not necessarily render the claims indefinite.

It is the opinion of the examiner that, when taking into account the context, the word "substantially" does indeed render the claim indefinite. By way of example, claims 2 recites:

"The method of according to claim 1, wherein said first maximum value is used as a default value for the power consumption, wherein the power consumption of the peripheral device is set, at a startup stage, to be **substantially not higher** than said first maximum value."

The particular wording used by applicant ("substantially not higher") appears to communicate that the power consumption for the device is set to *any* level that is not higher than the first maximum value – e.g. the power consumption may be equal to the first maximum value, it may be somewhat lower than the first maximum value, it may be considerably lower than the first maximum value, it may be considerably lower than the first maximum value, it may be considerably lower than the first maximum value, etc. Taken as a whole, the phrase "substantially not higher" lacks clarity in regards to the level at which the power consumption is being set. As an alternative, had the applicant chosen a wording such as "not substantially higher", then the word "substantially" would not render the claim indefinite (per MPEP 2173.05(b)(D)). In the alternative wording, the limitation may read as meaning "setting the power consumption to a level marginally higher than the first maximum power value."

## **Rejections based on prior art:**

Regarding independent claims 1, 9, 16, and 20, applicant's usage of the word "maximum" appears to lack any significant meaning in the context of the claims. By way of example, applicant has recited at least three "maximum" values for power consumption in claim 1 – a first maximum value, a second maximum value higher than the first maximum value, and a third maximum value that is between the first and second maximum values. Examiner fails to understand how all three power levels can be considered "maximum" when one of the three is higher than the other two. Since the applicant has not provided any legitimate definition for what "maximum" defines, examiner has interpreted the limitations in the broadest possible sense. As such, any prior art reference that determines a power consumption level for a peripheral device that is between a first power level and a second power level that is higher than the first power level may be considered as anticipating the limitations of these claims.

Based on this interpretation, Amoni teaches a method for determining power consumption for a peripheral device, the method comprising:

determining a first power level [Fig. 6A, step 611, 100 mA @ 5V minimum power]; determining a second power level higher than the first [max threshold, step 619]; setting a power level between the first and second power levels [step 625, col. 8, lines 30-39].

Robinson teaches:

determining a first power level [Fig. 6, step 130, col. 11, lines 31-34, standby power levels];

determining a second power level higher than the first [step 132, peak power levels]; setting a power level between the first and second power levels [step 136, reduced power level].

McKeen teaches:

determining a first power level [col. 1, lines 39-50, col. 2, lines 55-67, 8 dBm minimum power output level];

determining a second power level higher than the first [28 dBm maximum power output level];

setting a power level between the first and second power levels [setting current draw to 400 mA].

## Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 2, 4, 8, 10, 12, 13, 17, and 24 are rejected under 35 U.S.C. 112, second

paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject

matter which applicant regards as the invention.

Regarding claim 2, applicant has used the word "substantially" in line 5 to describe the

difference in degree between a power consumption setting and a first maximum limit. The

usage of "substantially" does not unambiguously limit the scope of applicant's claims. Claims 4,

8, 10, 13, 17, and 24 are also rejected on this basis.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

Art Unit: 2115

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-5, 9, 10, and 14-21, are rejected under 35 U.S.C. 102(b) as being anticipated

by Amoni et al., U.S. Patent No. 5,884,086<sup>1</sup> (claims 1, 2, 4, 9, 10, 16, 17, and 20), and

Robinson, U.S. Patent No. 5,532,945 (claims 1, 3, 9, 16, and 20).

Claims 1, 9, 14-16, and 18-20 are rejected under 35 U.S.C. 102(e) as being anticipated by McKeen et al., U.S. Patent No. 6,785,830<sup>2</sup>.

Regarding claim 1, each of Amoni, Robinson, and McKeen teaches:

a method for determining the power consumption in an electronic device, to which a peripheral device is connected, to which the power is supplied from the electronic device [Amoni, col. 2, lines 32-44, Fig. 6A/6B, Robinson, Fig. 6], wherein the method comprising determining, for the power consumption, at least a first maximum value [Amoni, Fig. 6A, step 611, Robinson, Fig. 6, step 130, col. 11, lines 31-34] and a second maximum value [Amoni, Fig. 6, step 619, max threshold, Robinson, Fig. 6, step 132, peak power] which is higher than the first maximum value, and performing, between the electronic device and the peripheral device, setting of a maximum for the power consumption of the peripheral device to a value which is between said first and second maximum values [Amoni, Fig. 6, step 625, Robinson, Fig. 6, step 136, reduced power, McKeen, col. 1, lines 39-50].

<sup>&</sup>lt;sup>1</sup> Applicant-cited reference.

Regarding claim 2, Amoni teaches:

the method according to claim 1, wherein said first maximum value is used as a default value for the power consumption, wherein the power consumption of the peripheral device is set, at the startup stage, to be substantially not higher than said first maximum value [col. 8, lines 19-22].

Regarding claim 3, Robinson teaches:

the method according to claim 1, wherein said second maximum value is used as the highest allowable value for the power consumption [Fig. 6, step 132, peak power].

Regarding claim 4, Amoni teaches:

the method according to claim 1, wherein messages are transferred between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum limit and said second maximum limit [col. 6, line 32ff, "Auxiliary Power Communication Protocol"].

Regarding claim 5, Robinson teaches:

the method according to claim 1, wherein at least one content is stored in the peripheral device, to be used in connection with the electronic device, wherein at the stage of storing the content, the power consumption set for the peripheral device is a value corresponding to said second maximum limit, and at the stage of using the content, the power consumption set for the peripheral device is a value consumption set for the peripheral device. It is a value consumption set for the peripheral device is a value consumption set for the peripheral device is a value consumption set for the peripheral device is a value consumption set for the peripheral device is a value consumption set for the peripheral device is a value corresponding to said first maximum limit [col. 1, line 67 to col. 2, line 3].

Regarding claims 9, 10, 16, 17, and 20, Amoni teaches the method of claims 1 and 4. Amoni also teaches the system, the electronic device, and the peripheral device to implement the claimed method.

<sup>&</sup>lt;sup>2</sup> U.S. issued patent of applicant-cited reference, WO 02/07494 A2.

Regarding claims 14, 15, 18, and 19, McKeen teaches the method of claim 1. McKeen also teaches the system and the electronic device to implement the claimed method, as recited in claims 9 and 16. McKeen also teaches that the electronic device is portable and comprises a means for performing mobile stations functions [hand-held PC and PC card radio transceiver,

col. 1, lines 39-44].

Regarding claim 21, Robinson teaches the method of claims 1 and 5. Robinson also teaches the peripheral device recited in claim 20 and the storage of content recited in claim 21.

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 6, 11, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Amoni in view of Yonezu et al., U.S. Patent No. 4,841,440<sup>3</sup>.

Regarding claims 6, 11, and 22, Amoni teaches that a clock signal is generated in the

device, but does not teach that the power consumption is controlled by adjusting the frequency

of the clock signal.

Yonezu teaches that power consumption may be reduced by inhibiting a control clock

signal for a peripheral device [abstract].

<sup>&</sup>lt;sup>3</sup> Applicant-cited reference.

It would have been obvious to one of ordinary skill in the art to modify Amoni using the teachings of Yonezu. Both Amoni and Yonezu disclose methods of power control for peripheral devices. The addition of Yonezu's teaching would improve Amoni by providing a way to reduce power consumption.

Claims 7, 12, and 23 rejected under 35 U.S.C. 103(a) as being unpatentable over Amoni in view of Gupta et al., U.S. Patent No. 5,996,083.

Regarding claims 7, 12, and 23, Amoni teaches that the peripheral device comprises a bus, but does not teach controlling power consumption by controlling a width of the bus.

Gupta teaches a technique wherein power consumption in a processor is reduced by changing the width of a bus [col. 9, lines 21-32].

It would have been obvious to one of ordinary skill in the art to modify Amoni by providing a capability to modify the bus width, as taught by Gupta. The teachings of Gupta would improve the system of Amoni by reducing the number of data lines driven on the bus, thus reducing the overall power consumption.

Claims 8, 13, and 24-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson in view of Holder, Jr., U.S. Patent No. 5,892,729.

Regarding claims 8, 13, and 24, Robinson teaches that the peripheral device comprises one or more storage blocks, but does not teach the controlling of the number of storage blocks processed.

Holder teaches a memory comprising multiple storage banks which may be selectively activated [col. 3, lines 21-32].

It would have been obvious to one of ordinary skill in the art to modify Robinson by providing selectable memory banks, as taught by Holder. The teachings of Holder would improve the system of Robinson by providing selectable memory banks so as to reduce power consumption.

Regarding claim 25, it would have been obvious to one of ordinary skill in the art to store the first and second maximum values in the peripheral device.

Regarding claim 26, it would have been obvious to one of ordinary skill in the art to apply the teachings of Robinson to a multimedia card peripheral device.

## Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ji H. Bae whose telephone number is 571-272-7181. The examiner can normally be reached on Monday-Friday, 10 am to 6:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Thomas Lee can be reached on 571-272-3667. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

## RESPONSE TO FINAL OFFICE ACTION AND REQUEST FOR CONTINUED EXAMINATION

Sir:

2006

In response to the final Office Action of March 23, 2006, applicant respectfully requests reconsideration of the rejections of the claims of the above-referenced patent application in view of the following amendments and remarks. Please amend the application as follows.

#### CERTIFICATE OF MAILING

I hereby certify that this correspondence is being deposited with the United States Postal Service on the date shown below with sufficient postage as first class mail in an envelope addressed to Mail Stop Amendment, the Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450

### IN THE CLAIMS:

1. (Currently Amended) A method comprising:

for determining <u>initiating determination of</u> power consumption in an electronic device, to which a peripheral device is connected, to <u>and from</u> which the power is supplied to the peripheral device; from the electronic device, wherein the method comprises

reading from a memory, determining, for in order to determine a maximum of the power consumption, at least a first maximum <u>limiting</u> value and a second maximum limiting value which is higher than the first maximum <u>limiting value</u>; value, and

performing, between the electronic device and the peripheral device, setting of a maximum for setting the maximum of the power consumption of the peripheral device to a value which is between said first and second maximum <u>limiting</u> values.

2. (Currently Amended) The method according to claim 1,

wherein said first maximum <u>limiting</u> value is used as a default value for the power consumption, <u>and</u>

wherein the power consumption of the peripheral device is set, at a startup stage, to be substantially not higher not substantially higher than said first maximum limiting value.

3. (Currently Amended) The method according to claim 1, wherein said second maximum limiting value is used as a highest allowable value for the power consumption.

4. (Currently Amended) The method according to claim 1, wherein messages are transferred between the electronic device and the peripheral device for setting <u>the maximum</u> <u>of</u> the power consumption of the peripheral device to a value substantially between said first maximum <u>limiting</u> value and said second maximum <u>limiting</u> value.

5. (Currently Amended) The method according to claim 1, wherein at least one content is stored in the peripheral device, for use in connection with the electronic device, wherein at a stage of storing the content, the power consumption set for the peripheral device is a value corresponding to said second maximum <u>limiting</u> value, and at a stage of using the content, the power consumption set for the peripheral device is a value corresponding to said first maximum <u>limiting</u> value.

6. (Previously Presented) The method according to the claim 1, wherein at least one clock signal is generated in the peripheral device and wherein the power consumption of the peripheral device is controlled by adjusting the frequency of at least one clock signal.

7. (Previously Presented) The method according to the claim 1, wherein the peripheral device comprises at least one bus and that the power consumption of the peripheral device is controlled by controlling a width of said bus.

8. (Currently Amended) The method according to the claim 1, wherein the peripheral device is provided with two or more storage blocks [[(2)]] controlled by controlling a number of storage blocks processed by the peripheral device substantially simultaneously.

9. (Currently Amended) A system comprising

## a peripheral device;

an electronic device with means for connecting a peripheral <u>the peripheral</u> device and means for supplying power to the peripheral device, and <del>which system comprises</del> means for determining power consumption,

wherein at least a first maximum <u>limiting</u> value and a second maximum <u>limiting</u> value which is higher than the first maximum <u>limiting</u> value are <del>defined</del> <u>stored</u> for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is between said first maximum <u>limiting</u> value and second maximum <u>limiting</u> value.

10. (Currently Amended) The system according to claim 9, <u>further</u> comprising means for transferring messages between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value substantially between said first maximum <u>limiting</u> value and said second maximum <u>limiting</u> value.

11. (Previously Presented) The system according to claim 9, wherein the peripheral device comprises means for generating at least one clock signal, and wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting the frequency of said at least one clock signal.

12. (Previously Presented) The system according to claim 9,

and

wherein the peripheral device comprises at least one bus, and wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting a bus width of the peripheral device.

13. (Currently Amended) The method system according to the claim 9,

wherein the peripheral device is provided with two or more storage blocks,

wherein the means for controlling the power consumption of the peripheral device comprise means for adjusting a number of storage blocks processed by the peripheral device substantially simultaneously.

14. (Previously Presented) The system according to the claim 9, wherein the electronic device is a portable electronic device .

15. (Currently Amended) The system according to claim 14, <u>further</u> comprising means for performing mobile station functions.

16. (Currently Amended) An electronic device provided with comprising:

means for connecting a peripheral device and device;

means for supplying power to the peripheral device, device; and means for determining power consumption,

wherein at least a first maximum <u>limiting</u> value and a second maximum <u>limiting</u> value which is higher than the first maximum <u>limiting</u> value are defined for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is between said first maximum <u>limiting</u> value and said second maximum <u>limiting</u> value.

17. (Currently Amended) The electronic device according to claim 16, <u>further</u> comprising means for transmitting messages from the peripheral device and for receiving messages to the peripheral device, to set <u>the maximum</u> power consumption of the peripheral device to a value substantially between said first maximum <u>limiting</u> value and said second maximum <u>limiting</u> value.

18. (Previously Presented) The electronic device according to claim 16, wherein it is a portable electronic device.

19. (Currently Amended) The electronic device according to claim 18, <u>further</u> comprising means for performing mobile station functions.

20. (Currently Amended) A peripheral device comprising: provided with

means for connecting the peripheral device to an electronic device for supplying power to the peripheral device,

wherein at least a first maximum <u>limiting</u> value and a second maximum <u>limiting</u> value which is higher than the first maximum <u>limiting</u> value, are defined for power consumption, and

wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which is between said first maximum <u>limiting</u> value and said second maximum <u>limiting</u> value.

21. (Previously Presented) The peripheral device according to claim 20, wherein at least one content is stored in the peripheral device for use in connection with the electronic device.

- 22. (Currently Amended) The peripheral device according to claim 20, <u>further</u> comprising means for generating at least one clock signal and means for controlling the power consumption of the peripheral device by frequency control of said at least one clock signal.
- 23. (Currently Amended) The peripheral device according to claim 20, <u>further</u> comprising at least one bus and
   means for controlling the power consumption of the peripheral device by

means for controlling the power consumption of the peripheral device by controlling a bus width of said bus of the peripheral device.

24. (Currently Amended) The peripheral device according to the claim 20,

wherein the peripheral device is provided with two or more storage blocks,

and

that wherein the means for controlling the power consumption of the peripheral device comprise means for controlling a number of storage blocks processed by the peripheral device substantially simultaneously.

25. (Currently Amended) The peripheral device according to the claim 20, wherein said first maximum <u>limiting</u> value and said second maximum <u>limiting</u> value are stored in the peripheral device.

26. (Previously Presented) The peripheral device according to the claim 20, wherein said peripheral device is a MultiMediaCard<sup>™</sup> peripheral device.

27. (New) An electronic device comprising:

a connector configured to connect a peripheral device;

a power supply configured to supply power to the peripheral device; and a power gauge configured to determine power consumption,

wherein at least a first maximum limiting value and a second maximum limiting value which is higher than the first maximum limiting value are defined for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is between said first maximum limiting value and said second maximum limiting value.

28. (New) The electronic device according to claim 27, further comprising

a transceiver configured to transmit messages from the peripheral device and for receiving messages to the peripheral device, to set the maximum power consumption of the peripheral device to a value substantially between said first maximum limiting value and said second maximum limiting value.

29. (New) A peripheral device comprising:

a connector configured to connect the peripheral device to an electronic device for supplying power to the peripheral device,

wherein at least a first maximum limiting value and a second maximum limiting value which is higher than the first maximum limiting value, are defined for power consumption, and

wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which is between said first maximum limiting value and said second maximum limiting value.

30. (New) The peripheral device according to the claim 29, wherein said first maximum limiting value and said second maximum limiting value are stored in the peripheral device.

31. (New) The electronic device according to claim 27, wherein it is a portable electronic device.

32. (New) The electronic device according to claim 27, further comprising a memory configured to store the first maximum limiting value and the second maximum limiting value.

## <u>REMARKS</u>

The independent claims are claims 1, 9, 16, and 20 plus new claims 27 and 29. Claims 1-26 are rejected. Claims 1-32 are now pending. All of the present amendments are fully supported by the specification as originally filed, and introduce no new matter.

## Amended Claim 2 is Not Indefinite

Claim 2 is now amended to state that the power consumption is "not substantially higher than a maximum" (instead of "substantially not higher"). This wording was suggested in the final Office Action, at page two.

Regarding claims 4, 8, 10, 12, 13, 17, and 24 rejected under 35 U.S.C. § 112, Applicant respectfully refers to MPEP § 2173.05(b)(D) which states that the term "substantially" is often used in a claim without rendering the claim indefinite. Applicant therefore traverses these indefiniteness rejections, for the reasons provided at MPEP § 2173.05(b)(D).

## The Amended Independent Claims are not Anticipated by the Cited Prior Art

Independent claims 1, 9, 16, and 20 are rejected as anticipated under 35 U.S.C. § 102 by *Amoni* (U.S. Patent No. 5,884,086), and also *Robinson* (U.S. Patent No. 5,532,945), and also *McKeen* (U.S. Patent No. 6,785,830). However, the independent claims are now amended to clarify the meaning of the word "maximum."

As seen in amended claim 1, for example, it is now clarified that the first value and the second value are <u>limiting</u> values for the maximum, the maximum being not yet set. Then the maximum is set, so that it falls between the limiting values. Claim 1 also clarifies that the first value and the second value are read from a memory. As indicated in claim 25, the memory may be located in the peripheral device.

The present invention is very useful when a peripheral device comes into contact with an electronic device that supplies power to the peripheral device. The peripheral device provides a range within which the maximum power consumption must fall, and the maximum power consumption is then determined, e.g. by the interaction described in claim 4.

The idea that the first and second maximum limiting values are stored is discussed, for example, at page 8, line 23 of the application (also see page 13 discussing that a memory card may be used at the peripheral device). Also, at least page 8, line 22 discusses that the first and second values are "maximum limits" (from between which the maximum will be selected).

The *Amoni* reference discloses a system and a method for supplying power to a peripheral device in a computer system. According to *Amoni*, the peripheral device instructs the main device to provide the necessary power to the peripheral device. The power level is not adjusted (handshaked) but the peripheral device is supplied with the power level it needs. In the main device there are switches for selecting a certain, fixed power level (col. 2, lines 40—44). The *Amoni* document does not mention anything about a maximum level, nor does it mention anything about using a certain value for the power level which is less than or equal to a maximum value. Moreover, the *Amoni* document does not teach anything about adjusting the power level to a value which is between two different maximum values.

*McKeen* discloses a radio modem card which is intended to be used in connection with a portable PC device. The maximum transmission power of the radio modem card is adjusted to a value which is between two different power levels defined in a standard of a mobile communication system. The maximum transmission power is within allowed tolerances. The limitation of the transmission power is implemented so that the maximum current consumption of the power amplifier of the radio modem card is limited to a certain maximum value. This maximum value is defined in such a way that the total current consumption of the radio modem card does not exceed a predetermined value. The aim of this arrangement is to prevent the radio modem card from overloading the PC device from which the power is supplied to the radio modem card. This is necessary because, according to the example disclosed in *McKeen*, batteries are used as the power source of the PC device and the current which can be supplied from the batteries is limited.

*McKeen* discloses the limitation of the transmission power between two standard values. This non-standard transmission power level is defined on the basis of how much power the power source of the PC device can supply to the radio modem card. The non-

standard power level is thus set to such value which allows the use of the maximum available current from the PC device. Therefore, a separate power source is not needed in the radio modem card to enable the use of the maximum transmission power of the radio modem card.

The solution of *McKeen* is quite different from the solution of the present claimed invention. In the present application, at least a first and a second maximum values are defined for the power consumption, and the maximum of the power consumption is set to a value which is substantially between said first and second maximum value. In the system of *McKeen* the portable PC device does not affect the adjustment of the transmission power of the radio modem card. In other words, in the system of *McKeen* no actions are taken between the PC device and the radio modem card to set the power consumption of the radio modem card. This means that the radio modem card always sets its power consumption to a certain value independent of the device to which the radio modem card is connected. Further, the adjustment of the transmission power and the adjustment of the power consumption are not the same issue. The adjustment of the transmission power determines how much power can be transmitted from the card and the adjustment of the power consumption determines how much power the card itself draws from the power source. The standard maximum power levels for the transmission power do not determine any limits for the power consumption of the card.

The Applicant also respectfully points out that the limitation of the transmission power of power amplifier of the radio modem card does not directly limit the power consumption of the radio modem card. It may happen that although the transmission power is limited, the power consumption of the radio modem card may still vary due to alterations in the power consumption of other electronics of the radio modem card. In the solution disclosed by *Robinson*, a "power resource table" stored at the host is used, which table is updated and it can be read by the card.

On page 6 of the Office Action, several dependent claims are rejected in view of *Yonezu* (US Patent No. 4,841,440), or in view of *Gupta* (U.S. Patent No. 5,996,083), or in view of *Holder* (U.S. Patent No. 5,892,729). *Yonezu* discloses a solution where the idle/standby power consumption is controlled to the minimum. *Holder* discloses power consumption by controlling the clock connecting to different integrated circuits. *Gupta* 

also discloses a solution which seems to comprise two-way handshakes. There is a register on the host side, according to which the external device controls its function (the document mentions controlling the bandwidth as one way to decrease power consumption if the host register indicates a smaller maximum consumption than what is required for the external device).

Because all of the present independent claims should be allowable, the claims depending therefrom should also be allowable, notwithstanding *Yonezu*, *Gupta*, *and Holder*.

### Further Comments About the Present Application

The invention of the present application provides an improved method and system for determining the power consumption to be suitable in each situation. The invention is based on the idea that at least a first and a second maximum value are determined for the power consumption, wherein the electronic device and the peripheral device set the power consumption to a value between these first and second maximum values. Thus, in different operating situations, for example the peripheral device can adjust its power consumption to be suitable for the situation.

By the method according to the invention, it is possible to avoid the use of an unnecessarily large regulator in an electronic device, which saves costs, and wherein the size of the electronic device can, in some cases, be reduced and, on the other hand, problems of heating caused by high power consumption can be avoided. Also the power consumption can be reduced, which is advantageous particularly in portable devices. By means of the invention, the peripheral device connection can also be provided with flexibility, because the power consumption of the peripheral device can be adjusted and set to a value suitable for each situation of use. Furthermore, the invention makes it possible that new peripheral devices to be developed will function in connection with electronic devices made earlier, and existing peripheral devices will function in connection with new electronic devices to be developed. None of these advantages can be achieved by the cited references.

### **CONCLUSION**

Thus, the Examiner is asked to kindly reconsider the Office Action in the light of the arguments presented herein, and to correspondingly issue a favorable Office Action at the next stage of the proceedings. The present amendments raise no new issues, and introduce no new matter.

Early allowance of all independent claims (and the pending claims depending therefrom) is earnestly solicited. Applicant would be grateful if the Examiner would please contact Applicant's attorney by telephone if the Examiner detects anything in the present response that might impede a speedy allowance.

Respectfully submitted,

## IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re application of: K. Mylly Application No.: 10/ 401,338 Group No.: 2115 Filed: March 26, 2003 Examiner: J. Bae For: Method and System for Determining the Power Consumption in Connection with an Electronic Device, and an Commissioner for Patents Washington, D.C. 20231

## REQUEST FOR CONTINUED EXAMINATION (RCE) (37 C.F.R. § 1.114)

1. Applicant hereby requests continued examination, in accordance with 37 C.F.R. § 1.114, for the above identified application.

NOTE: 37 C.F.R. § 1.114 Request for continued examination:

"(a) If prosecution in an application is closed, an applicant may request continued examination of the application by filing a submission and the fee set forth in § 1.17(e) prior to the earliest of:

(1) Payment of the issue fee, unless a petition under § 1.313 is granted;

(2) Abandonment of the application; or

(3) The filing of a notice of appeal to the U.S. Court of Appeals for the Federal Circuit under 35 U.S.C. 141, or the commencement of a civil action under 35 U.S.C. 145 or 146, unless the appeal or civil action is terminated.

(b) Prosecution in an application is closed as used in this section means that the application is under appeal, or that the last Office action is a final action (§ 1.113), a notice of allowance (§ 1.311), or an action that otherwise closes prosecution in the application.

## CERTIFICATION UNDER 37 C.F.R. §§ 1.8(a) and 1.10\*

(When using Express Mail, the Express Mail label number is mandatory; Express Mail certification is optional.)

(c) A submission as used in this section includes, but is not limited to, an information disclosure statement, an amendment to the written description, claims, or drawings, new arguments, or new evidence in support of patentability. If reply to an Office action under 35 U.S.C. 132 is outstanding, the submission must meet the reply requirements of § 1.111.

. 1

(d) If an applicant timely files a submission and fee set forth in § 1.17(e), the Office will withdraw the finality of any Office action and the submission will be entered and considered. If an applicant files a request for continued examination under this section after appeal, but prior to a decision on the appeal, it will be treated as a request to withdraw the appeal and to reopen prosecution of the application before the examiner. An appeal brief under § 1.192 or a reply brief under § 1.193(b), or related papers, will not be considered a submission under this section."

- NOTE: An applicant may file a submission under 37 CFR 1.114 containing only an information disclosure statement (37 CFR 1.97 and 1.98) in an application subject to a notice of allowance under 35 U.S.C. § 151. An appeal brief or a reply brief (or related papers) will not be considered a submission under 37 CFR 1.114. See 37 CFR 1.114(d). The submission, however, may consist of the arguments in a previously filed appeal brief or reply brief, or may simply consist of a statement that incorporates by reference the arguments in a previously filed appeal brief or reply brief arguments. American Inventor's Protection Act of 1999, Question & Answer A5.
- NOTE: Even though an RCE is improper (e.g., because it was filed before the prosecution is closed), an amendment submitted with the RCE will still be entered and considered by the examiner since it was timely filed and responsive to the non-final Office action in compliance with 37 CFR 1.111. American Inventor's Protection Act of 1999, Question & Answer A4.
- WARNING: 35 U.S.C. 132(b) and § 1.114 provide for the continued examination of an application and not examination of a continuing application). Accordingly, the Office will not permit an applicant to obtain continued examination on the basis of claims that are independent and distinct from the claims previously claimed and examined. Notice of March 10, 2000, 65 Fed Reg 14865, at 14868.
- WARNING: The provisions of 37 CFR 1.114 also do not apply (1) to a provisional application; (2) an application for a utility or plant patent filed under 35 U.S.C. 111(a) before June 8, 1995; (3) an international application filed under 35 U.S.C. 363 before June 8, 1995; (4) a patent under reexamination or (5) an application for a design patent. 37 CFR § 1.114(e).
- WARNING: The PTO has pointed out why § 1.97(b) does not provide that an information disclosure statement will be considered if it is filed within three months after the date of a request for continued examination under § 1.114. The PTO explained that since an RCE filing is a reply under 35 U.S.C. 132, the applicant may be entitled to patent term adjustment if the Office does not act on an application containing a request for continued examination under § 1.114 within four months. See 35 U.S.C. 154(b)(1)(A)(ii). Thus, the Office cannot delay action on RCE applications for three months to determine whether an information disclosure statement will be filed. The Office, however, is adopting provisions (§ 1.103(c)) for a limited suspension of action after the filing of a request for continued examination under § 1.114, for the applicant to obtain additional time (prior to the issuance of the next Office action) to provide an information disclosure statement (or amendments, or an affidavit or declaration) after the filing of the RCE. See, Notice of August 16, 2000, "Request for Continued Examination Practice and Changes to Provisional Application Practice; Final Rule", 65Fed. Reg., pages 50091–50105, at page 50100 (comment 11); OG: September 5, 2000, pages 13–24
- WARNING: One of the time periods excluded from patent term adjustment is the time consumed by a continued examination request under 35 U.S.C. 132(b) (§ 1.114(b) (1)).
- **WARNING:** The Office will not suspend action in an application when a reply by the applicant is outstanding. 35 U.S.C. 133 requires an applicant to "prosecute the application" within six months of an Office action (or a shorter period as set in the Office action) to avoid abandonment of the application. If an applicant files a request for continued examination but does not also provide any submission (in reply to the prior Office action) within the period for reply to the prior Office action, the application is abandoned by operation of law (35 U.S.C. 133).

The Office will treat a request for continued examination under § 1.114 containing a bona fide submission that is not fully responsive to the prior Office action under the practice set forth in § 1.135(c). In addition, under the limited suspension of action provisions of § 1.103(c), an applicant must still file a request for continued examination practice in compliance with § 1.114, but may obtain additional time (prior to the issuance of the next Office action) to provide an information disclosure statement, amendments, or an affidavit or declaration after the filing of the request for continued examination.

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 2 of 6)

See, Notice of August 16, 2000, "Request for Continued Examination Practice and Changes to Provisional Application Practice; Final Rule", 65Fed. Reg., pages 50091-50105, at page 50102 (comment 20); OG: September 5, 2000, pages 13-24) Page 50102

- WARNING: Section 1.97(b) does not provide that an information disclosure statement will be considered if it is filed within three months after the date of a request for continued examination under § 1.114.
- NOTE: There is no limit to the number of times the fee for continued examination may be submitted. Notice of March 10, 2000, 65 Fed Reg 14865, at 14868.
- NOTE: Unlike a continuation application, a continued examination request can utilize the mailing procedure of 37 CFR 1.8. See 37 CFR § 1.8(a)(2)(i)(A).

Continued Prosecution Request Fee \$ 790.00

## TIME REQUEST IS BEING MADE

- 2. This request is being submitted (check appropriate item(s) below):
  - i Prior to abandonment of the application
  - ii. D Payment of the issue fee
    - Prior to payment of issue fee
    - □ Issue fee has been paid but a petition under § 1.313 has been granted
  - iii. 
    Prior to a decision on appeal to the Board of Patent Appeals & Interferences
    - □ A notice is being separately sent to the Board of Patent Appeals & Interferences that this Request for Continued Examination is being filed.
- NOTE: If such a notice is not sent to the Board then may refuse to vacate a decision rendered after the filing of the RCE but before recognition by the Office of the RCE request under § 1.114.
- iv. Appeal to the U.S. Court of Appeals of the Federal Circuit under 35 U.S.C. 145 or Commencement of a civil action under 35 U.S.C. 146
  - Prior to the filing of such appeal or commencement of civil action
  - Such appeal or commencement of civil action has been terminated

#### **ENCLOSURES**

3. Enclosed herewith is/are:

WARNING: If reply to a final or non-final Office action under 35 U.S.C. 132 is outstanding, the submission must meet the reply requirements of § 1.111. 37 C.F.R. § 1.114(b).

- An information disclosure (37 C.F.R. § 1.98)
  - Form PTO-1449 (PTO/SB/08A and 08B)
- An amendment
- New arguments
- New evidence in support of patentability
- Other:

Continued Prosecution Request Fee \$ \_790.00

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 3 of 6)

## FEE FOR REQUEST (37 C.F.R. § 1.17(e)).

This application is on behalf of:	
Small entity (and status is still as small entity)	\$375.00
Other than a small entity	· · · · · · · · · · · · · \$7 <b>9</b> 0.00

#### FEE FOR CLAIMS

NOTE: "The fee for continued examination under § 1.114 (§ 1.17(e)) does not include additional claims fee (cf. 1.53 (d)(3)(ii))." See Notice of March 10, 2000, 65 Fed Reg 14865, at 14868.

37 CFR 1.53(d)(3): "The filing fee for a continued prosecution application filed under this paragraph is:

(i) The basic filing fee as set forth in § 1.16; and

4.

Any additional § 1.16 fee due based on the number of claims remaining in the application after entry of any amendment accompanying the request for an application under this paragraph and entry of any amendments under § 1.116 unentered in the prior application which applicant has requested to be entered in the continued prosecution application."

5. The fee for claims (37 C.F.R. § 1.16(b)-(d)) has been calculated as shown below:

	(Col. 1)		(Col. 2)	(C	ol. 3)	SMAL	L ENTITY		SMALL	THAN A ENTITY	
	CLAIMS REMAINING AFTER AMENDMENT		HIGHEST NO. PREVIOUSLY PAID FOR	PR E	ESENT XTRA	RATE	addit. Fee	OR	RATE	ADDIT. FEE	
TOTAL	• 32	MINUS		=	6	x\$9=	\$		x\$ <b>£€</b>	\$ 300	.00
INDEP.	. 6	MINUS	···· 4	=	2	x\$42=	\$		×	\$ 400.	00
FIRST	PRESENTATION	OF MULT	IPLE DEP. CLAI	M		+\$140=	\$		+ \$280 =	\$	
		,, =, =, =		_	ADI	TOTAL DIT. FEE	\$	OR	TOTAL ADDIT. FEE \$	700.0	N

If the entry in Col. 1 is less than entry in Col. 2, write "0" in Col. 3.

" If the "Highest No. Previously Paid for" IN THIS SPACE is less than 20, enter "20."

If the "Highest No. Previously Paid For" IN THIS SPACE is less than 3, enter "3." The "Highest No. Previously Paid For" (Total or Indep.) is the highest number found in the appropriate box in Col. 1 of a prior amendment or the number of claims originally filed.

WARNING: See 37 C.F.R. § 1.116.

#### (complete (a) or (b), as applicable)

(a) 🗌 No additional fee is required.

(b) X Total additional fee required is \$ 700.00

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 4 of 6)

#### **EXTENSION OF TIME**

(If an extension of time is appropriate complete (a) or (b), as applicable)

- 6. The proceedings herein are for a patent application, and the provisions of 37 C.F.R. § 1.136(a) apply.
  - NOTE: 37 C.F.R. § 1.704(b) "... an applicant shall be deemed to have failed to engage in reasonable efforts to conclude processing or examination of an application for the cumulative total of any periods of time in excess of three months that are taken to reply to any notice or action by the Office making any rejection, objection, argument, or other request, measuring such three-month period from the date the notice or action was mailed or given to the applicant, in which case the period of adjustment set forth in § 1.703 shall be reduced by the number of days, if any, beginning on the day after the date that is three months after the date of mailing or transmission of the Office communication notifying the applicant of the rejection, objection, argument, or other request and ending on the date the reply was filed. The period, or shortened statutory period, for reply that is set in the Office action or notice has no effect on the three-month period set forth in this paragraph."
  - (a) ☐ Applicant petitions for an extension of time, the fees for which are set out in 37 C.F.R. § 1.17(a)(1)-(4), for the total number of months checked below:

Extension for	Fee for other than	Fee for		
(months)	small entity	small entity		
one month	\$ 110.00	\$ 55.00		
two months	\$ 410.00	\$ 205.00		
three months	\$ 930.00	\$ 465.00		
four months	\$ 1,450.00	\$ 725.00		
	Fee:	\$		

If an additional extension of time is required, please consider this a petition therefor.

(check and complete the next item, if applicable)

An extension for \_\_\_\_\_ months has already been secured, and the fee paid therefor of \$ \_\_\_\_\_ is deducted from the total fee due for the total months of extension now requested.

Extension fee due with this request \$\_\_\_\_\_

#### OR

(b) Applicant believes that no extension of time is required. However, this is a conditional petition and authorization to pay the necessary fees to provide for the possibility that applicant has inadvertently overlooked the need for a petition and fee for extension of time.

#### **TOTAL FEE(S) DUE**

WARNING: The fee for continued examination under § 1.114 may not be deferred. 37 C.F.R. § 1.53(f).

7. The total fee(s) due is/are:

Continued Prosecution Fee (§ 1.17(e))

Fee(s) for additional claims (if any) (§ 1.16(b)-(d))

Extension of time fee (if any) (§ 1.17(a)(1)-(4))

\$ <u>790.00</u> \$ 700.00

\$\_\_\_\_\_ Total Fee(s) Due \$\_<u>1,490.0</u>0

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 5 of 6)

#### PAYMENT OF FEE(S) DUE

- 8. Please pay the fee(s) for this continued examination application as follows:
  - Check is attached for the sum of
  - Charge Account \_\_\_\_\_ the sum of
  - Charge Credit Card the sum of
    - (Credit Card Payment Form (PTO-2038) attached)

Please charge any required additional fee(s) for § 1.17(e), § 1.16(b)-(d) and/or § 1.17(a)(1)-(4) to

Account 23-0442

Credit Card (Credit Card Payment Form (PTO-2038) attached).

#### INVENTORSHIP

- NOTE: Any change of inventors must be via the procedure set forth in 37 CFR § 1.48. See Notice of March 10, 2000, 65 Fed Reg 14865, at 14868.
- 9. This application as amended names as inventors:

45,858

- the same inventors as previously designated for the claims.
- fewer than the inventors previously designated ans a statement accompanies this request for the deletion of the name or names of the person or persons who are not inventors of the invention now being claimed.
- a person not named previously as an inventor and a petition under 37 C.F.R.
   § 1.48 is/has separately: □ being filed □ been filed

#### **DEFERRAL OF EXAMINATION**

**10.** A request for deferral of examination accompanies this request for continued examination.

Office Action Summary

Part of Paper No./Mail Date 20060706

#### DETAILED ACTION

#### Response to Arguments

Applicant's arguments, see page 9 of applicant's remarks, filed on 26 June 2006, with respect to rejection of claims 2, 4, 8, 10, 12, 13, 17, and 24 under 35 U.S.C. 112 have been fully considered and are persuasive. The rejection of the claims has been withdrawn.

Applicant's arguments filed on 26 June 2006 with respect to prior art rejections have been fully considered but they are not persuasive.

Applicant has amended the claims and offered a number of arguments to clarify the meaning of the word "maximum" as used in the claims. In particular, applicant has amended the "first maximum value" and "second maximum value" to read as a "first maximum limiting value" and a "second maximum limiting value". Applicant presented the argument that the first and second values are limiting values for the maximum value [applicant's remarks, page 9, fifth paragraph]. In addition, applicant has presented the argument that the maximum value for the power consumption is set to be between the first limiting value and second limiting value.

Notwithstanding applicant's arguments and amendments, the usage of "maximum" remains problematic in applicant's claims. With respect to the first and second values, the examiner points out that by applicant's own admission, these values are merely limiting values for the maximum value, and not the maximum value themselves. As such, the usage of "maximum" to describe these limits is superfluous at best, and confusing at worst, as the word "maximum" appears to describe the limit (as opposed to the power consumption value being set). Examiner recommends amending the limitations to read "a first limiting value for the power consumption."

In addition to the limit values, applicant's usage of "maximum" to describe the power settings also remains problematic. Applicant's disclosure teaches that the "maximum" power

consumption may occupy a range between the first and second limiting values, and that the maximum power consumption setting is fixed using applicant's inventive method. However, examiner points out that once the power setting is fixed, then to call the fixed power setting a "maximum" power consumption value is meaningless, since according to applicant's own teaching the power consumption remains static for the duration of the most recent setting. Applicant does appear to teach that the power consumption is variable, but only by **changing** the setting, and not once the setting has been fixed. Unless the power consumption setting is set to the highest limit value, or unless the power consumption may vary once the setting has been made, there appears to be no reasonable justification for labeling the power consumption setting in the context of the claims.

For these reasons, the rejection of the claims based on Robinson, U.S. Patent No. 5,532,945, remains valid. In particular, Robinson teaches a first and second limiting value for power consumption, and the setting of the power consumption to a value between the limiting values [Fig. 6]. Since the power consumption of Robinson is fixed based on the most recent setting, Robinson also teaches the "maximum" power setting taught by applicant.

### Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1 are rejected under 35 U.S.C. 102(b) as being anticipated by Robinson, U.S.

Patent No. 5,532,945.

Regarding claim 1, Robinson teaches a method comprising [Fig. 6]:

initiating determination of power consumption in an electronic device, to which a peripheral device is connected, and from which the power is supplied to the peripheral device;

reading from a memory [CIS, col. 11, lines 31-34], in order to determine a maximum of the power consumption, at least a first maximum limiting value and a second maximum limiting value [peak and standby values]; and

setting the maximum of the power consumption to a value which is between said first and second maximum limiting values [step 136, reduced power].

Regarding claim 2, Robinson teaches that the first maximum limiting value is a default value, and that the power consumption settings are set to the default upon reset [col. 9, lines 57-64].

Regarding claim 3, Robinson teaches that the second maximum limiting value is used as a highest allowable value for the power consumption.

Regarding claim 4, Robinson teaches that messages are transferred between the peripheral device and the electronic device for setting the maximum power consumption value [col. 11, lines 35-50, request\_power\_function and success return codes].

Regarding claim 5, Robinson teaches at least one content is stored in the peripheral device, to be used in connection with the electronic device, wherein at the stage of storing the content, the power consumption set for the peripheral device is a value corresponding to said second maximum limiting value, and at the stage of using the content, the power consumption set for the peripheral device is a value corresponding to said first maximum limiting value [col. 1, ,line 65 to col. 2, line 7].

Regarding claims 9, 10, 14-21, 25, and 27-32 Robinson teaches the method of claims 1-5, and also the system and device to implement the claimed method. Robinson also teaches

that the peripheral device is a portable electronic device [Fig. 1, removable flash card,

fax/modem card], and that the peripheral device performs mobile station functions [fax/modem

card, Fig. 1].

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 6, 11, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson in view of Yonezu et al., U.S. Patent No. 4,841,440<sup>1</sup>.

Regarding claims 6, 11, and 22, Robinson teaches the method of claim 1, but does not

teach that the power consumption is controlled by adjusting the frequency of a clock signal.

Yonezu teaches that power consumption may be reduced by inhibiting a control clock

signal for a peripheral device [abstract].

It would have been obvious to one of ordinary skill in the art to modify Robinson using

the teachings of Robinson. Both Robinson and Yonezu disclose methods of power control for peripheral devices. The addition of Yonezu's teaching would improve Robinson by providing a way to reduce power consumption.

<sup>&</sup>lt;sup>1</sup> Applicant-cited reference.

Claims 7, 12, and 23 rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson in view of Gupta et al., U.S. Patent No. 5,996,083.

Regarding claims 7, 12, and 23, Robinson teaches the method of claim 1, but does not teach controlling power consumption by controlling a width of a bus.

Gupta teaches a technique wherein power consumption in a processor is reduced by changing the width of a bus [col. 9, lines 21-32].

It would have been obvious to one of ordinary skill in the art to modify Robinson by providing a capability to modify the bus width, as taught by Gupta. The teachings of Gupta would improve the system of Robinson by reducing the number of data lines driven on the bus, thus reducing the overall power consumption.

Claims 8, 13, and 24-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson in view of Holder, Jr., U.S. Patent No. 5,892,729.

Regarding claims 8, 13, and 24, Robinson teaches that the peripheral device comprises one or more storage blocks, but does not teach the controlling of the number of storage blocks processed.

Holder teaches a memory comprising multiple storage banks which may be selectively activated [col. 3, lines 21-32].

It would have been obvious to one of ordinary skill in the art to modify Robinson by providing selectable memory banks, as taught by Holder. The teachings of Holder would improve the system of Robinson by providing selectable memory banks so as to reduce power consumption.

Regarding claim 25, it would have been obvious to one of ordinary skill in the art to store the first and second maximum values in the peripheral device.

Page 6

Regarding claim 26, it would have been obvious to one of ordinary skill in the art to apply the teachings of Robinson to a multimedia card peripheral device.

### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ji H. Bae whose telephone number is 571-272-7181. The examiner can normally be reached on Monday-Friday, 10 am to 6:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Thomas Lee can be reached on 571-272-3667. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

## IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Re Application of: Kimmo MYLLY

U.S. Serial No.: 10/401,338

Examiner: Ji H. Bae

Filed: March 26, 2003

Group Art Unit: 2115

## For: A METHOD AND SYSTEM FOR DETERMINING THE POWER CONSUMPTION IN CONNECTION WITH AN ELECTRONIC DEVICE, AND AN ELECTRONIC DEVICE

Mail Stop Amendment – No Fee Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

## **RESPONSE TO NON-FINAL OFFICE ACTION**

Sir:

In response to the non-final Office Action of July 14, 2006, applicant respectfully requests reconsideration of the rejections of the claims of the above-referenced patent application in view of the following amendments and remarks. Please amend the application as follows.

#### CERTIFICATE OF MAILING

I hereby certify that this correspondence is being deposited with the United States Postal Service on the date shown below with sufficient postage as first class mail in an envelope addressed to Mail Stop Amendment, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450

nen Margery B. Hop Dated:

## IN THE CLAIMS:

1. (Currently Amended) A method comprising:

initiating determination of power consumption in an electronic device, to which a peripheral device is connected, and from which the power is supplied to the peripheral device;

setting the power consumption of the peripheral device at a startup stage to a <u>default value</u>;

reading from a memory, in order to determine a maximum of the power consumption, at least a first-maximum limiting value and a second maximum limiting value which is higher than the first maximum limiting said default value; and

setting the maximum of the power consumption to a value which is between in a range from said first default value to said and second maximum limiting values value, wherein the range includes said default value and said limiting value.

2. CANCEL.

3. (Currently Amended) The method according to claim 1, wherein said second maximum limiting value is used as a highest allowable value for the power consumption.

4. (Currently Amended) The method according to claim 1, wherein messages are transferred between the electronic device and the peripheral device for setting the maximum of the power consumption of the peripheral device to a value substantially between said first maximum limiting value and said second maximum limiting value in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value.

5. (Currently Amended) The method according to claim 1, wherein at least one content is stored in the peripheral device, for use in connection with the electronic device, wherein at a stage of storing the content, the power consumption set for the peripheral device is a value

corresponding to said second maximum limiting value, and at a stage of using the content, the power consumption set for the peripheral device is a value corresponding to said first maximum limiting default value.

6. (Previously Presented) The method according to the claim 1, wherein at least one clock signal is generated in the peripheral device and wherein the power consumption of the peripheral device is controlled by adjusting the frequency of at least one clock signal.

7. (Previously Presented) The method according to the claim 1, wherein the peripheral device comprises at least one bus and that the power consumption of the peripheral device is controlled by controlling a width of said bus.

8. (Previously Presented) The method according to the claim 1, wherein the peripheral device is provided with two or more storage blocks controlled by controlling a number of storage blocks processed by the peripheral device substantially simultaneously.

9. (Currently Amended) A system comprising

a peripheral device;

an electronic device with means for connecting the peripheral device and means for supplying power to the peripheral device, and

means for determining power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a first maximum limiting value and a second maximum limiting value which is higher than the first maximum limiting said default value are is stored for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is <u>in a</u> <u>range from said default value to said limiting value, said range including said default value</u> <u>and said limiting value.</u> <del>between said first maximum limiting value and second maximum</del> <u>limiting value</u>.

10. (Currently Amended) The system according to claim 9, further comprising means for transferring messages between the electronic device and the peripheral device for setting the power consumption of the peripheral device to a value in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value substantially between said first maximum limiting value and said second maximum limiting value.

11. (Previously Presented) The system according to claim 9, wherein the peripheral device comprises means for generating at least one clock signal, and wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting the frequency of said at least one clock signal.

12. (Previously Presented) The system according to claim 9,

wherein the peripheral device comprises at least one bus, and wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting a bus width of the peripheral device.

13. (Previously Presented) The system according to the claim 9,

wherein the peripheral device is provided with two or more storage blocks, and

wherein the means for controlling the power consumption of the peripheral device comprise means for adjusting a number of storage blocks processed by the peripheral device substantially simultaneously.

14. (Previously Presented) The system according to the claim 9, wherein the electronic device is a portable electronic device .

15. (Previously Presented) The system according to claim 14, further comprising means for performing mobile station functions.

16. (Currently Amended) An electronic device comprising:

means for connecting a peripheral device;

means for supplying power to the peripheral device; and

means for determining power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a first maximum limiting value and a second maximum limiting value which is higher than the first maximum limiting said default value are is defined for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is <u>in a</u> <u>range from said default value to said limiting value, said range including said default value</u> <u>and said limiting value.</u> between said first maximum limiting value and said second <u>maximum limiting value</u>.

17. (Currently Amended) The electronic device according to claim 16, further comprising

means for transmitting messages from the peripheral device and for receiving messages to the peripheral device, to set the maximum power consumption of the peripheral device to a value in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value substantially between said first maximum limiting value and said second maximum limiting value.

18. (Previously Presented) The electronic device according to claim 16, wherein it is a portable electronic device.

19. (Previously Presented) The electronic device according to claim 18, further comprising means for performing mobile station functions.

20. (Currently Amended) A peripheral device comprising:

means for connecting the peripheral device to an electronic device for supplying power to the peripheral device,
wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a first maximum limiting value and a second maximum limiting value which is higher than the first maximum limiting said default value, are is defined for power consumption, and

wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which is <u>in a range from said default value</u> to said limiting value, said range including said default value and said limiting value between said first maximum limiting value and said second maximum limiting value.

21. (Previously Presented) The peripheral device according to claim 20, wherein at least one content is stored in the peripheral device for use in connection with the electronic device.

22. (Previously Presented) The peripheral device according to claim 20, further comprising means for generating at least one clock signal and means for controlling the power consumption of the peripheral device by

frequency control of said at least one clock signal.

23. (Previously Presented) The peripheral device according to claim 20, further comprising at least one bus and

means for controlling the power consumption of the peripheral device by controlling a bus width of said bus of the peripheral device.

24. (Previously Presented) The peripheral device according to the claim 20, wherein the peripheral device is provided with two or more storage blocks, and

wherein the means for controlling the power consumption of the peripheral device comprise means for controlling a number of storage blocks processed by the peripheral device substantially simultaneously.

25. (Currently Amended) The peripheral device according to the claim 20, wherein said first maximum limiting default value and at least one said second maximum limiting value are stored in the peripheral device.

26. (Previously Presented) The peripheral device according to the claim 20, wherein said peripheral device is a MultiMediaCard<sup>™</sup> peripheral device.

27. (Currently Amended) An electronic device comprising:

a connector configured to connect a peripheral device;

a power supply configured to supply power to the peripheral device; and a power gauge configured to determine power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a first maximum limiting value and a second maximum limiting value which is higher than the first maximum limiting said default value are is defined for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is <u>in a</u> <u>range from said default value to said limiting value, said range including said default value</u> <u>and said limiting value.</u> between said first maximum limiting value and said second <u>maximum limiting value</u>.

28. (Currently Amended) The electronic device according to claim 27, further comprising a transceiver configured to transmit messages from the peripheral device and for receiving messages to the peripheral device, to set the maximum power consumption of the peripheral device to a value in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value substantially between said first maximum limiting value and said second maximum limiting value.

29. (Currently Amended) A peripheral device comprising:

a connector configured to connect the peripheral device to an electronic device for supplying power to the peripheral device,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a first maximum limiting value and a second maximum limiting value which is higher than the first maximum limiting said default value, are is defined for power consumption, and

wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which <u>in a range from said default value to</u> <u>said limiting value, said range including said default value and said limiting value is</u> <u>between said first maximum limiting value and said second maximum limiting value</u>.

30. (Currently Amended) The peripheral device according to the claim 29, wherein said first maximum limiting default value and at least one said second maximum limiting value are stored in the peripheral device.

31. (Previously Presented) The electronic device according to claim 27, wherein it is a portable electronic device.

32. (Currently Amended) The electronic device according to claim 27, further comprising a memory configured to store the first-maximum limiting default value and the second maximum limiting value.

### <u>REMARKS</u>

The independent claims are claims 1, 9, 16, 20, 27 and 29. All of claims 1-32 now stand rejected. The Office Action has withdrawn the anticipation rejection based upon *Amoni* and *McKeen*. However, all claims are again rejected as anticipated by *Robinson* (U.S. Patent No. 5,532,945).

All of the present amendments are fully supported by the specification as originally filed, and introduce no new matter. The present amendments of the independent claims are supported at least by claim 2 as originally filed; and by the paragraph beginning on page 7, line 20; and the paragraph beginning at page 9, line 5; and by the paragraph beginning at page 11, line 5.

A major difference between the present application and prior art is that, in the present solution, the power consumption is at a first stage that is low (default) and is raised (if possible). In contrast, according to prior solutions, the power consumption is at a first stage that is high (peak power) and is decreased if necessary.

The invention of the present application provides an improved method and system for determining the power consumption. By the method according to the invention, it is possible to avoid the use of an unnecessarily large regulator in an electronic device, which saves costs, and wherein the size of the electronic device can, in some cases, be reduced and, on the other hand, problems of heating caused by high power consumption can be avoided. Also the power consumption can be reduced, which is advantageous particularly in portable devices. By means of the invention, the peripheral device connection can also be provided with flexibility, because the power consumption of the peripheral device can be adjusted and set to a value suitable for each situation of use. Furthermore, the invention makes it possible that new peripheral devices to be developed will function in connection with electronic devices made earlier, and existing peripheral devices will function in connection with new electronic devices to be developed. None of these advantages can be achieved by the cited solution disclosed by *Robinson*, which includes a "power resource table" stored at the host, which table is updated and can be read by a card.

## **CONCLUSION**

Thus, the Examiner is asked to kindly reconsider the Office Action in the light of the arguments presented herein, and to correspondingly issue a favorable Office Action at the next stage of the proceedings. The present amendments raise no new issues, and introduce no new matter.

Early allowance of all independent claims (and the pending claims depending therefrom) is earnestly solicited. Please not that the Applicant has partially followed the recommendation in the penultimate full sentence on page 2 of the non-final Office Action. Applicant would be grateful if the Examiner would please contact Applicant's attorney by telephone if the Examiner detects anything in the present response that might impede a speedy allowance.

Respectfully submitted,

Dated: 0c+, 11,2006

#### **DETAILED ACTION**

## Response to Arguments

Applicant's arguments filed 16 October 2006 have been fully considered but they are not persuasive.

Applicant has amended the claims and provided supporting argumentation for those features of the applicant's invention that the applicant believes are novel over the prior art. Specifically, on page 9 of applicant's remarks, the applicant states:

"A major difference between the present application and prior art is that, in the present solution, the power consumption is at a first stage that is low (default) and is raised (if possible). In contrast, according to prior solutions, the power consumption is at a first stage that is high (peak power) and is decreased if necessary."

In response, the examiner respectfully disagrees and re-asserts the position that Robinson does in fact teach the features that the applicant believes are novel over the prior art. Referring to Fig. 6 of Robinson, step 130 of the method teaches reading the CIS of the removable device. According to Robinson's disclosure, reading the CIS involves obtaining the **default standby power levels** for the system [col. 11, lines 27-34, col. 9, lines 62-64]. In the next step [132], a request for **peak** power is made. When the request for peak power is made, the system issues a request\_power function [col. 11, lines 35-37]. Robinson teaches that the request\_power function first determines **existing** power allocations in the system, and then determines if there is enough power available to provide the requested amount. Thus, it is presupposed in Robinson's request\_power method that there is already some power allocated to the system before the request for additional power is made. Robinson further teaches that if there is not enough power to provide the requested peak power, the request is repeated with a lower requested power until the available power is able to satisfy the requested power [col. 11,

lines 35-50]. Since in this case the power supplied is less than the peak power, the result is that

the power consumption is set to a value that is between the initially supplied value and the requested peak power.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-5, 9, 10, 14-21, 25, and 27-32 are rejected under 35 U.S.C. 102(b) as being

anticipated by Robinson, U.S. Patent No. 5,532,945.

Regarding claim 1, Robinson teaches a method comprising [Fig. 6]:

initiating determination of power consumption in an electronic device, to which a

peripheral device is connected, and from which the power is supplied to the peripheral device;

setting the power consumption of the peripheral device at a startup stage to a default

value [see examiner's response to arguments]

reading from a memory [CIS, col. 11, lines 31-34], in order to determine a maximum of

the power consumption, at least a limiting value which is higher than said default value [peak and standby values]; and

setting the maximum of the power consumption to a value which is in a range from said default value to said limiting value [step 136, reduced power].

Regarding claim 2, Robinson teaches that a default value, and that the power consumption settings are set to the default upon reset [col. 9, lines 57-64].

Regarding claim 3, Robinson teaches that the limiting value is used as a highest allowable value for the power consumption.

Regarding claim 4, Robinson teaches that messages are transferred between the peripheral device and the electronic device for setting the maximum power consumption value [col. 11, lines 35-50, request\_power\_function and success return codes].

Regarding claim 5, Robinson teaches at least one content is stored in the peripheral device, to be used in connection with the electronic device, wherein at the stage of storing the content, the power consumption set for the peripheral device is a value corresponding to said limiting value, and at the stage of using the content, the power consumption set for the peripheral device is a value for the peripheral device is a value corresponding to said default value [col. 1, ,line 65 to col. 2, line 7].

Regarding claims 9, 10, 14-21, 25, and 27-32 Robinson teaches the method of claims 1-5, and also the system and device to implement the claimed method. Robinson also teaches that the peripheral device is a portable electronic device [Fig. 1, removable flash card, fax/modem card], and that the peripheral device performs mobile station functions [fax/modem card, Fig. 1].

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 6, 11, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson in view of Yonezu et al., U.S. Patent No. 4,841,440<sup>1</sup>.

Regarding claims 6, 11, and 22, Robinson teaches the method of claim 1, but does not teach that the power consumption is controlled by adjusting the frequency of a clock signal.

Yonezu teaches that power consumption may be reduced by inhibiting a control clock signal for a peripheral device [abstract].

It would have been obvious to one of ordinary skill in the art to modify Robinson using the teachings of Robinson. Both Robinson and Yonezu disclose methods of power control for peripheral devices. The addition of Yonezu's teaching would improve Robinson by providing a way to reduce power consumption.

Claims 7, 12, and 23 rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson in view of Gupta et al., U.S. Patent No. 5,996,083.

Regarding claims 7, 12, and 23, Robinson teaches the method of claim 1, but does not teach controlling power consumption by controlling a width of a bus.

Gupta teaches a technique wherein power consumption in a processor is reduced by changing the width of a bus [col. 9, lines 21-32].

It would have been obvious to one of ordinary skill in the art to modify Robinson by providing a capability to modify the bus width, as taught by Gupta. The teachings of Gupta would improve the system of Robinson by reducing the number of data lines driven on the bus, thus reducing the overall power consumption.

<sup>&</sup>lt;sup>1</sup> Applicant-cited reference.

Claims 8, 13, and 24-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Robinson in view of Holder, Jr., U.S. Patent No. 5,892,729.

Regarding claims 8, 13, and 24, Robinson teaches that the peripheral device comprises one or more storage blocks, but does not teach the controlling of the number of storage blocks processed.

Holder teaches a memory comprising multiple storage banks which may be selectively activated [col. 3, lines 21-32].

It would have been obvious to one of ordinary skill in the art to modify Robinson by providing selectable memory banks, as taught by Holder. The teachings of Holder would improve the system of Robinson by providing selectable memory banks so as to reduce power consumption.

Regarding claim 25, it would have been obvious to one of ordinary skill in the art to store the first and second maximum values in the peripheral device.

Regarding claim 26, it would have been obvious to one of ordinary skill in the art to apply the teachings of Robinson to a multimedia card peripheral device.

#### Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37

CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ji H. Bae whose telephone number is 571-272-7181. The examiner can normally be reached on Monday-Friday, 10 am to 6:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Thomas Lee can be reached on 571-272-3667. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. ## For: A METHOD AND SYSTEM FOR DETERMINING THE POWER CONSUMPTION IN CONNECTION WITH AN ELECTRONIC DEVICE, AND AN ELECTRONIC DEVICE

Mail Stop RCE Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450

## RESPONSE TO FINAL OFFICE ACTION AND REQUEST FOR CONTINUED EXAMINATION

Sir:

In response to the final Office Action of 27 December 2006, applicant respectfully requests reconsideration of the rejections of the claims of the abovereferenced patent application in view of the following amendments and remarks. Please amend the application as follows.

CERTIFICATE OF MAILING

I hereby certify that this correspondence is being deposited with the United States Postal Service on the date shown below with sufficient postage as first class mail in an envelope addressed to Mail Stop RCE, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450

## IN THE CLAIMS:

Р. н. н. н.

1. (Currently Amended) A method comprising:

initiating determination of power consumption in an electronic device, to which a peripheral device is connected, and from which the power is supplied to the peripheral device;

setting the power consumption of the peripheral device at a startup stage to a default value;

reading from a memory, in order to determine a maximum of the power consumption, at least a limiting value which is higher than said default value; and

setting the maximum of the power consumption to a value which is in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value,

wherein information is transferred from the electronic device to the peripheral device for setting the maximum of the power consumption of the peripheral device.

2. CANCEL.

3. (Previously Presented) The method according to claim 1, wherein said limiting value is used as a highest allowable value for the power consumption.

4. (Currently Amended) <u>A method comprising:</u>

initiating determination of power consumption in an electronic device, to which a peripheral device is connected, and from which the power is supplied to the peripheral device;

setting the power consumption of the peripheral device at a startup stage to a default value;

reading from a memory, in order to determine a maximum of the power consumption, at least a limiting value which is higher than said default value; and setting the maximum of the power consumption to a value which is in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value,

The method according to claim 1, wherein messages are transferred between the electronic device and the peripheral device for setting the maximum of the power consumption of the peripheral device to a value in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value.

5. (Previously Presented) The method according to claim 1, wherein at least one content is stored in the peripheral device, for use in connection with the electronic device, wherein at a stage of storing the content, the power consumption set for the peripheral device is a value corresponding to said limiting value, and at a stage of using the content, the power consumption set for the peripheral device.

6. (Previously Presented) The method according to the claim 1, wherein at least one clock signal is generated in the peripheral device and wherein the power consumption of the peripheral device is controlled by adjusting the frequency of at least one clock signal.

7. (Previously Presented) The method according to the claim 1, wherein the peripheral device comprises at least one bus and that the power consumption of the peripheral device is controlled by controlling a width of said bus.

8. (Previously Presented) The method according to the claim 1, wherein the peripheral device is provided with two or more storage blocks controlled by controlling a number of storage blocks processed by the peripheral device substantially simultaneously.

9. (Currently Amended) A system comprising

۲. 4

<u>،</u> و

a peripheral device;

an electronic device with means for connecting the peripheral device and means for supplying power to the peripheral device, and

means for determining power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a limiting value which is higher than said default value is stored for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, <u>and</u>

wherein the electronic device is configured to transfer information to the peripheral device for setting the maximum of the power consumption of the peripheral device.

10. CANCEL.

the second

.

11. (Previously Presented) The system according to claim 9, wherein the peripheral device comprises means for generating at least one clock signal, and wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting the frequency of said at least one clock signal.

12. (Previously Presented) The system according to claim 9,

wherein the peripheral device comprises at least one bus, and wherein the system comprises means for controlling the power consumption of the peripheral device by adjusting a bus width of the peripheral device.

13. (Previously Presented) The system according to the claim 9,

wherein the peripheral device is provided with two or more storage blocks, and

wherein the means for controlling the power consumption of the peripheral device comprise means for adjusting a number of storage blocks processed by the peripheral device substantially simultaneously.

14. (Previously Presented) The system according to the claim 9, wherein the electronic device is a portable electronic device .

15. (Previously Presented) The system according to claim 14, further comprising means for performing mobile station functions.

16. (Currently Amended) An electronic device comprising:

means for connecting a peripheral device;

means for supplying power to the peripheral device; and

means for determining power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a limiting value which is higher than said default value is defined for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, and

wherein the means for supplying the power is configured to transfer information to the peripheral device for setting the maximum of the power consumption of the peripheral device.

17. CANCEL.

. .

18. (Previously Presented) The electronic device according to claim 16, wherein it is a portable electronic device.

19. (Previously Presented) The electronic device according to claim 18, further comprising means for performing mobile station functions.

20. (Currently Amended) A peripheral device comprising:

means for connecting the peripheral device to an electronic device for supplying power to the peripheral device,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a limiting value which is higher than said default value, is defined for power consumption, and

wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, and

wherein the peripheral device is configured to receive information from the electronic device for setting the maximum of the power consumption of the peripheral device.

21. (Previously Presented) The peripheral device according to claim 20, wherein at least one content is stored in the peripheral device for use in connection with the electronic device.

- 22. (Previously Presented) The peripheral device according to claim 20, further comprising means for generating at least one clock signal and means for controlling the power consumption of the peripheral device by frequency control of said at least one clock signal.
- 23. (Previously Presented) The peripheral device according to claim 20, further comprising at least one bus and means for controlling the power consumption of the peripheral device by controlling a bus width of said bus of the peripheral device.
- 24. (Previously Presented) The peripheral device according to the claim 20,wherein the peripheral device is provided with two or more storage blocks,

and

۰.

. .

wherein the means for controlling the power consumption of the peripheral device comprise means for controlling a number of storage blocks processed by the peripheral device substantially simultaneously.

25. (Previously Presented) The peripheral device according to the claim 20, wherein said default value and at least one limiting value are stored in the peripheral device.

26. (Previously Presented) The peripheral device according to the claim 20, wherein said peripheral device is a MultiMediaCard<sup>™</sup> peripheral device.

27. (Currently Amended) An electronic device comprising:

a connector configured to connect a peripheral device;

a power supply configured to supply power to the peripheral device; and a power gauge configured to determine power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

wherein at least a limiting value which is higher than said default value is defined for the power consumption, and

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, and

wherein the electronic device is configured to transfer information to the peripheral device for setting the maximum of the power consumption of the peripheral device.

28. CANCEL.

· .

. .

.

29. (Currently Amended) A peripheral device comprising:

a connector configured to connect the peripheral device to an electronic device for supplying power to the peripheral device,

wherein the power consumption of the peripheral device is set at a startup stage to a default value,

•

. .

wherein at least a limiting value which is higher than said default value, is defined for power consumption, and

wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which in a range from said default value to said limiting value, said range including said default value and said limiting value, and

wherein the peripheral device is configured to receive information from the electronic device for setting the maximum of the power consumption of the peripheral device.

30. (Previously Presented) The peripheral device according to the claim 29, wherein said default value and at least one limiting value are stored in the peripheral device.

31. (Previously Presented) The electronic device according to claim 27, wherein it is a portable electronic device.

32. (Previously Presented) The electronic device according to claim 27, further comprising a memory configured to store the default value and the limiting value.

33. (New) The method according to claim 4, wherein said limiting value is used as a highest allowable value for the power consumption.

## <u>REMARKS</u>

The independent claims are claims 1, 9, 16, 20, 27 and 29. All of these independent claims now stand rejected as anticipated by *Robinson* (U.S. Patent No. 5,532,945). Claim 4 is now placed in independent form, because Applicant respectfully submits claim 4 should not have been rejected.

### Claim 4 is not Suggested by the Robinson Reference

• .

. .

The Office Action stated (at page 4, second paragraph): "Robinson teaches that messages are transferred between the peripheral device and the electronic device for setting the maximum power consumption value [col. 11, lines 35-50, request\_power\_function and success return codes]." However, Applicant respectfully submits that those messages described at col. 11, lines 35-50 of *Robinson* do not involve any peripheral device. The *Robinson* reference states (at col. 11 lines 35-40) the following:

"[T]he card services client device driver requests peak power from the card services 64 using the request\_power function.... [T]he card services client device driver determines whether a success code was returned from the card services 64 for the request\_power function."

The messages are thus transferred between the card services **64** and the card services client device driver such as the card services clients **60** and **61** or the logical device driver **56** (see col. 11, lines 20-23). <u>None</u> of these elements (**60**, **61**, and **56**) is a peripheral device, as can be seen in Figure 3 of the *Robinson* reference.

Figure 3 of *Robinson* shows that the card services client device drivers 60, 61, and 56 are not located in the peripheral devices 30 or 32 (also see also Figure 2 which shows components in the peripheral device 30). Therefore, the messages of *Robinsons* are <u>not</u> transferred between any peripheral device and the electronic device.

The card services 64 is clearly indicated in Figure 3 of *Robinson*. It is also explained in *Robinson* (col. 11 lines 20-23) that "Each card service client device driver such as the card service clients 60 and 61 and the logical device driver 56..." All of this is shown in Figure 3 of *Robinson*, and therefore it is evident that *Robinson* does not teach

or suggest that messages are transferred between the peripheral device and the electronic device for setting the maximum power consumption value, as claimed by claim 4.

### Amendment of the Independent Claims

• • • •

Dependent claims 10, 17, and 28 are now cancelled. Independent claims 1, 9, 16, 20, 27, and 29 are now amended in order to include limitations similar to those in claim 4. Support for these limitations can be found at page 9 of the application as originally filed. These amendments introduce no new matter. New claim 33 is supported by present claim 3.

#### **CONCLUSION**

Thus, the Examiner is asked to kindly reconsider the Office Action in the light of the arguments presented herein, and to correspondingly issue a favorable Office Action at the next stage of the proceedings.

Early allowance of all independent claims (and the pending claims depending therefrom) is earnestly solicited. Applicant would be grateful if the Examiner would please contact Applicant's attorney by telephone if the Examiner detects anything in the present response that might impede a speedy allowance.

Respectfully submitted,

Dated: 26 March 2007

## **REQUEST FOR CONTINUED EXAMINATION (RCE)** (37 C.F.R. § 1.114)

1. Applicant hereby requests continued examination, in accordance with 37 C.F.R. § 1.114, for the above identified application.

NOTE: 37 C.F.R. § 1.114 Request for continued examination:

"(a) If prosecution in an application is closed, an applicant may request continued examination of the application by filing a submission and the fee set forth in § 1.17(e) prior to the earliest of:

(1) Payment of the issue fee, unless a petition under § 1.313 is granted;

(2) Abandonment of the application; or

(3) The filing of a notice of appeal to the U.S. Court of Appeals for the Federal Circuit under 35 U.S.C. 141, or the commencement of a civil action under 35 U.S.C. 145 or 146, unless the appeal or civil action is terminated.

(b) Prosecution in an application is closed as used in this section means that the application is under appeal, or that the last Office action is a final action (§ 1.113), a notice of allowance (§ 1.311), or an action that otherwise closes prosecution in the application.

## CERTIFICATION UNDER 37 C.F.R. §§ 1.8(a) and 1.10\*

(When using Express Mail, the Express Mail label number is mandatory; Express Mail certification is optional.)

I hereby certify that, on the date shown below, this correspondence is being:

MAILING

deposited with the United States Postal Service in an envelope addressed to the Commissioner for Patents, Washington, D.C. 20231

37 C.F.R. § 1.8(a)

37 C.F.R. § 1.10 \*

в. (type or print name of person certifying)

\* Only the date of filing (§ 1.6) will be the date used in a patent term adjustment calculation, although the date on any certificate of mailing or transmission under § 1.8 continues to be taken into account in determining timeliness. See § 1.703(f). Consider "Express Mail Post Office to Addressee" (§ 1.10) or facsimile transmission (§ 1.6(d)) for the reply to be accorded the earliest possible filing date for patent term adjustment calculations.

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 1 of 6)

(c) A submission as used in this section includes, but is not limited to, an information disclosure statement, an amendment to the written description, claims, or drawings, new arguments, or new evidence in support of patentability. If reply to an Office action under 35 U.S.C. 132 is outstanding, the submission must meet the reply requirements of § 1.111.

**ب**ر در

(d) If an applicant timely files a submission and fee set forth in § 1.17(e), the Office will withdraw the finality of any Office action and the submission will be entered and considered. If an applicant files a request for continued examination under this section after appeal, but prior to a decision on the appeal, it will be treated as a request to withdraw the appeal and to reopen prosecution of the application before the examiner. An appeal brief under § 1.192 or a reply brief under § 1.193(b), or related papers, will not be considered a submission under this section."

- NOTE: An applicant may file a submission under 37 CFR 1.114 containing only an information disclosure statement (37 CFR 1.97 and 1.98) in an application subject to a notice of allowance under 35 U.S.C. § 151. An appeal brief or a reply brief (or related papers) will not be considered a submission under 37 CFR 1.114. See 37 CFR 1.114(d). The submission, however, may consist of the arguments in a previously filed appeal brief or reply brief, or may simply consist of a statement that incorporates by reference the arguments in a previously filed appeal brief or reply brief are previously filed appeal brief or reply brief, or may simply consist of a statement that incorporates by reference the arguments in a previously filed appeal brief or reply brief. In addition, a previously filed amendment after final may satisfy this submission requirement. American Inventor's Protection Act of 1999, Question & Answer A5.
- NOTE: Even though an RCE is improper (e.g., because it was filed before the prosecution is closed), an amendment submitted with the RCE will still be entered and considered by the examiner since it was timely filed and responsive to the non-final Office action in compliance with 37 CFR 1.111. American Inventor's Protection Act of 1999, Question & Answer A4.
- WARNING: 35 U.S.C. 132(b) and § 1.114 provide for the continued examination of an application and **not** examination of a continuing application). Accordingly, the Office will not permit an applicant to obtain continued examination on the basis of claims that are independent and distinct from the claims previously claimed and examined. Notice of March 10, 2000, 65 Fed Reg 14865, at 14868.
- WARNING: The provisions of 37 CFR 1.114 also do not apply (1) to a provisional application; (2) an application for a utility or plant patent filed under 35 U.S.C. 111(a) before June 8, 1995; (3) an international application filed under 35 U.S.C. 363 before June 8, 1995; (4) a patent under reexamination or (5) an application for a design patent. 37 CFR § 1.114(e).
- WARNING: The PTO has pointed out why § 1.97(b) does not provide that an information disclosure statement will be considered if it is filed within three months after the date of a request for continued examination under § 1.114. The PTO explained that since an RCE filing is a reply under 35 U.S.C. 132, the applicant may be entitled to patent term adjustment if the Office does not act on an application containing a request for continued examination under § 1.114 within four months. See 35 U.S.C. 154(b)(1)(A)(ii). Thus, the Office cannot delay action on RCE applications for three months to determine whether an information disclosure statement will be filed. The Office, however, is adopting provisions (§ 1.103(c)) for a limited suspension of action after the filing of a request for continued examination under § 1.114, for the applicant to obtain additional time (prior to the issuance of the next Office action) to provide an information disclosure statement (or amendments, or an affidavit or declaration) after the filing of the RCE. See, Notice of August 16, 2000, "Request for Continued Examination Practice and Changes to Provisional Application Practice; Final Rule", 65Fed. Reg., pages 50091–50105, at page 50100 (comment 11); OG: September 5, 2000, pages 13–24
- WARNING: One of the time periods excluded from patent term adjustment is the time consumed by a continued examination request under 35 U.S.C. 132(b) (§ 1.114(b) (1)).
- WARNING: The Office will not suspend action in an application when a reply by the applicant is outstanding. 35 U.S.C. 133 requires an applicant to "prosecute the application" within six months of an Office action (or a shorter period as set in the Office action) to avoid abandonment of the application. If an applicant files a request for continued examination but does not also provide any submission (in reply to the prior Office action) within the period for reply to the prior Office action, the application is abandoned by operation of law (35 U.S.C. 133).

The Office will treat a request for continued examination under § 1.114 containing a bona fide submission that is not fully responsive to the prior Office action under the practice set forth in § 1.135(c). In addition, under the limited suspension of action provisions of § 1.103(c), an applicant must still file a request for continued examination practice in compliance with § 1.114, but may obtain additional time (prior to the issuance of the next Office action) to provide an information disclosure statement, amendments, or an affidavit or declaration after the filing of the request for continued examination.

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 2 of 6)

See, Notice of August 16, 2000, "Request for Continued Examination Practice and Changes to Provisional Application Practice; Final Rule", 65Fed. Reg., pages 50091-50105, at page 50102 (comment 20); OG: September 5, 2000, pages 13-24] Page 50102

- WARNING: Section 1.97(b) does not provide that an information disclosure statement will be considered if it is filed within three months after the date of a request for continued examination under § 1.114.
- NOTE: There is no limit to the number of times the fee for continued examination may be submitted. Notice of March 10, 2000, 65 Fed Reg 14865, at 14868.
- NOTE: Unlike a continuation application, a continued examination request can utilize the mailing procedure of 37 CFR 1.8. See 37 CFR § 1.8(a)(2)(i)(A).

Continued Prosecution Request Fee \$ \_\_\_\_\_

#### TIME REQUEST IS BEING MADE

- 2. This request is being submitted (check appropriate item(s) below):
  - i X Prior to abandonment of the application
  - ii. 
    Payment of the issue fee

e ;

- Prior to payment of issue fee
- □ Issue fee has been paid but a petition under § 1.313 has been granted
- iii. 
  Prior to a decision on appeal to the Board of Patent Appeals & Interferences
  - □ A notice is being separately sent to the Board of Patent Appeals & Interferences that this Request for Continued Examination is being filed.
- NOTE: If such a notice is not sent to the Board then may refuse to vacate a decision rendered after the filing of the RCE but before recognition by the Office of the RCE request under § 1.114.
- iv. □ Appeal to the U.S. Court of Appeals of the Federal Circuit under 35 U.S.C. 145 or □ Commencement of a civil action under 35 U.S.C. 146
  - Prior to the filing of such appeal or commencement of civil action
  - Such appeal or commencement of civil action has been terminated

#### **ENCLOSURES**

3. Enclosed herewith is/are:

WARNING: If reply to a final or non-final Office action under 35 U.S.C. 132 is outstanding, the submission must meet the reply requirements of § 1.111. 37 C.F.R. § 1.114(b).

- An information disclosure (37 C.F.R. § 1.98)
  - Form PTO-1449 (PTO/SB/08A and 08B)
- An amendment
- X New arguments
- New evidence in support of patentability
- Other:

Continued Prosecution Request Fee \$\_\_\_\_\_

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 3 of 6)

## FEE FOR REQUEST (37 C.F.R. § 1.17(e)).

4. This application is on behalf of:

υ, , ,

	Small entity (and status is still as small entity)	\$375.00
X	Other than a small entity	\$ <b>79</b> 0.00

#### **FEE FOR CLAIMS**

NOTE: "The fee for continued examination under § 1.114 (§ 1.17(e)) does not include additional claims fee (cf. 1.53 (d)(3)(ii))." See Notice of March 10, 2000, 65 Fed Reg 14865, at 14868.

37 CFR 1.53(d)(3): "The filing fee for a continued prosecution application filed under this paragraph is:

(i) The basic filing fee as set forth in § 1.16; and

Any additional § 1.16 fee due based on the number of claims remaining in the application after entry of any amendment accompanying the request for an application under this paragraph and entry of any amendments under § 1.116 unentered in the prior application which applicant has requested to be entered in the continued prosecution application."

5. The fee for claims (37 C.F.R. § 1.16(b)-(d)) has been calculated as shown below:

	(Col. 1)			(Col. 2)	(Col. 3)	SMAL	l entity		OTHER SMALL	THAN A ENTITY
	Claims Remaining After Amendment		HIC PR P	Ghest No. Eviously Paid For	PRESENT EXTRA	RATE	addit. Fee	OR	RATE	addit. Fee
TOTAL	· 29	MINUS	••	32	=	x\$9=	\$		x\$18=	\$
INDEP.	. 7	MINUS	•••	6	=	x\$42=	\$		200-	\$ 200
FIRST	PRESENTATION	OF MULT	TIPLE	DEP. CLAIM		+ \$140 =	\$		+ \$280 =	\$
<u>.                                    </u>					A	TOTAL DDIT. FEE	\$	OR	TOTAL ADDIT. FEE \$	200.0

\* If the entry in Col. 1 is less than entry in Col. 2, write "0" in Col. 3.

" If the "Highest No. Previously Paid for" IN THIS SPACE is less than 20, enter "20."

If the "Highest No. Previously Paid For" IN THIS SPACE is less than 3, enter "3." The "Highest No. Previously Paid For" (Total or Indep.) is the highest number found in the appropriate box in Col. 1 of a prior amendment or the number of claims originally filed.

WARNING: See 37 C.F.R. § 1.116.

(complete (a) or (b), as applicable)

(a) 🗌 No additional fee is required.

OR

(b) X Total additional fee required is \$\_\_\_\_\_\_\_

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 4 of 6)

#### EXTENSION OF TIME

(If an extension of time is appropriate complete (a) or (b), as applicable)

- 6. The proceedings herein are for a patent application, and the provisions of 37 C.F.R. § 1.136(a) apply.
  - NOTE: 37 C.F.R. § 1.704(b) "... an applicant shall be deemed to have failed to engage in reasonable efforts to conclude processing or examination of an application for the cumulative total of any periods of time in excess of three months that are taken to reply to any notice or action by the Office making any rejection, objection, argument, or other request, measuring such three-month period from the date the notice or action was mailed or given to the applicant, in which case the period of adjustment set forth in § 1.703 shall be reduced by the number of days, if any, beginning on the day after the date that is three months after the date of mailing or transmission of the Office communication notifying the applicant of the rejection, objection, argument, or other request and ending on the date the reply was filed. The period, or shortened statutory period, for reply that is set in the Office action or notice has no effect on the three-month period set forth in this paragraph."
  - (a) Applicant petitions for an extension of time, the fees for which are set out in 37 C.F.R. § 1.17(a)(1)-(4), for the total number of months checked below:

Extension for	Fee for other than	Fee for
(months)	small entity	small entity
one month	\$ 110.00	\$ 55.00
two months	\$ 410.00	\$ 205.00
three months	\$ 930.00	\$ 465.00
four months	\$ 1,450.00	\$ 725.00
	Fee:	\$

If an additional extension of time is required, please consider this a petition therefor.

(check and complete the next item, if applicable)

An extension for \_\_\_\_\_ months has already been secured, and the fee paid therefor of \$\_\_\_\_\_ is deducted from the total fee due for the total months of extension now requested.

Extension fee due with this request \$\_\_\_\_\_

#### OR

(b) Applicant believes that no extension of time is required. However, this is a conditional petition and authorization to pay the necessary fees to provide for the possibility that applicant has inadvertently overlooked the need for a petition and fee for extension of time.

#### TOTAL FEE(S) DUE

WARNING: The fee for continued examination under § 1.114 may not be deferred. 37 C.F.R. § 1.53(f).

7. The total fee(s) due is/are:

Continued Prosecution Fee (§ 1.17(e))

Fee(s) for additional claims (if any) (§ 1.16(b)-(d))

Extension of time fee (if any) (§ 1.17(a)(1)-(4))

\$ 790.00 200.00

Total Fee(s) Due \$ 29

(Request for Continued Examination (RCE) (37 C.F.R. § 1.114) [9-64]-page 5 of 6)

#### **PAYMENT OF FEE(S) DUE**

- 8. Please pay the fee(s) for this continued examination application as follows:
  - K Check is attached for the sum of

- . .

- Charge Account \_\_\_\_\_ the sum of
- Charge Credit Card the sum of

(Credit Card Payment Form (PTO-2038) attached)

Please charge any required additional fee(s) for § 1.17(e), § 1.16(b)-(d) and/or § 1.17(a)(1)-(4) to

Credit Card (Credit Card Payment Form (PTO-2038) attached).

#### INVENTORSHIP

- NOTE: Any change of inventors must be via the procedure set forth in 37 CFR § 1.48. See Notice of March 10, 2000, 65 Fed Reg 14865, at 14868.
- 9. This application as amended names as inventors:

45,858

- the same inventors as previously designated for the claims.
- fewer than the inventors previously designated ans a statement accompanies this request for the deletion of the name or names of the person or persons who are not inventors of the invention now being claimed.
- a person not named previously as an inventor and a petition under 37 C.F.R.
   § 1.48 is/has separately: 
   being filed
   been filed

#### **DEFERRAL OF EXAMINATION**

**10.** A request for deferral of examination accompanies this request for continued examination.

APPLN. TYPE	SMALL ENTITY	ISSUE FEE DUE	PUBLICATION FEE DUE	PREV. PAID ISSUE FEE	TOTAL FEE(S) DUE	DATE DUE
nonprovisional	NO	\$1400	\$300	\$0	\$1700	09/13/2007

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. <u>PROSECUTION ON THE MERITS IS CLOSED</u>. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN <u>THREE MONTHS</u> FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. <u>THIS</u> <u>STATUTORY PERIOD CANNOT BE EXTENDED</u>. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

### HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:	If the SMALL ENTITY is shown as NO:
A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.	A. Pay TOTAL FEE(S) DUE shown above, or
B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or	B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check box 5a on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and 1/2 the ISSUE FEE shown above.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

#### Determination of Patent Term Adjustment under 35 U.S.C. 154 (b) (application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 472 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 472 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

#### **EXAMINER'S AMENDMENT**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Andrew Hyman on 7 June 2007.

The application has been amended as follows:

Claim 1, amended to read:

A method comprising:

initiating determination of power consumption in an electronic device, to which a peripheral device is connected, and from which the power is supplied to the peripheral device, wherein the peripheral device comprises a memory, said memory storing a default value and a limiting value for the power consumption;

setting the power consumption of the peripheral device at a startup state to **said** default value;

reading from the memory at least **said** limiting value which is higher than said default value; and

setting the maximum of the power consumption to a value which is in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value,

wherein information is transferred from the electronic device to the peripheral device for setting the maximum of the power consumption of the peripheral device.

Page 2

Claim 4, amended to read:

A method comprising:

initiating determination of power consumption in an electronic device, to which a peripheral device is connected, and from which the power is supplied to the peripheral device, wherein the peripheral device comprises a memory, said memory storing a default value and a limiting value for the power consumption;

setting the power consumption of the peripheral device at a startup stage to **said** default value;

reading from the memory at least **said** limiting value which is higher than said default value; and

setting the maximum of the power consumption to a value which is in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value,

wherein messages are transferred between the electronic device and the peripheral device for setting the maximum of the power consumption of the peripheral device to a value in a range from said default value to said limiting value, wherein the range includes said default value and said limiting value.

Claim 9, amended to read:

A system comprising

a peripheral device, wherein the peripheral device comprises a memory, said memory storing a default value and a limiting value for the power consumption;

an electronic device with means for connecting the peripheral device and means for supplying power to the peripheral device, and means for determining power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to **said** default value,

wherein at least **said** limiting value which is higher than said default value is stored for the power consumption,

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, and

wherein the electronic device is configured to transfer information to the peripheral device for setting the maximum of the power consumption of the peripheral device.

Claim 16, amended to read:

An electronic device comprising:

means for connecting a peripheral device, wherein the peripheral device

comprises a memory, said memory storing a default value and a limiting value for

#### the power consumption;

means for supplying power to the peripheral device; and

means for determining power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to **said** default value,

wherein at least **said** limiting value which is higher than said default value is defined for the power consumption,

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, and

wherein the means for supplying the power is configured to transfer information to the peripheral device for setting the maximum of the power consumption of the peripheral device.

Claim 20, amended to read:

A peripheral device comprising:

a memory storing a default value and a limiting value for power consumption;

means for connecting the peripheral device to an electronic device for supplying power to the peripheral device,

wherein the power consumption of the peripheral device is set at a startup stage to **said** default value,

wherein at least **said** limiting value which is higher than said default value is defined for power consumption,

wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, and wherein the peripheral device is configured to receive information from the electronic device for setting the maximum of the power consumption of the peripheral device.

Claim 27, amended to read:

An electronic device comprising:

a connector configured to connect to a peripheral device, wherein the

peripheral device comprises a memory, said memory storing a default value and a limiting value for the power consumption;

a power supply configured to supply power to the peripheral device; and

a power gauge configured to determine power consumption,

wherein the power consumption of the peripheral device is set at a startup stage to **said** default value,

wherein at least **said** limiting value which is higher than said default value is defined for the power consumption,

wherein the means for determining the power consumption comprise means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, and

wherein the electronic device is configured to transfer information to the peripheral device for setting the maximum of the power consumption of the peripheral device.

Claim 29, amended to read:

A peripheral device comprising:

# a memory storing a default value and a limiting value for power consumption;

a connector configured to connect the peripheral device to an electronic device for supplying power to the peripheral device,

wherein the power consumption of the peripheral device is set at a startup stage to **said** default value,

wherein at least **said** limiting value which is higher than said default value is defined for power consumption,

wherein the peripheral device comprises means for setting a maximum power consumption of the peripheral device to a value which is in a range from said default value to said limiting value, said range including said default value and said limiting value, and

wherein the peripheral device is configured to receive information from the electronic device for setting the maximum of the power consumption of the peripheral device.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ji H. Bae whose telephone number is 571-272-7181. The examiner can normally be reached on Monday-Friday, 10 am to 6:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Thomas Lee can be reached on 571-272-3667. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

#### **ISSUE NOTIFICATION**

The projected patent number and issue date are specified above.

#### Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)

(application filed on or after May 29, 2000)

The Patent Term Adjustment is 472 day(s). Any patent to issue from the above-identified application will include an indication of the adjustment on the front page.

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at (571)-272-4200.

APPLICANT(s) (Please see PAIR WEB site http://pair.uspto.gov for additional applicants):

Kimmo Mylly, Tampere, FINLAND;

Approved for use through 1U20/2014, OMB 0651-0035 U.3, Patent and Thedemark Office; U E DE PARTMENT OF COMMERCE

Under the Paperwork Reduction Act of 1988, no persons are required to respond to a collection of information unless Education a valid OMB control number.
