

UNITED STATES PATENT AND TRADEMARK OFFICE

BEFORE THE PATENT TRIAL AND APPEAL BOARD

LSI CORPORATION and AVAGO TECHNOLOGIES U.S., INC.,
Petitioner,

v.

REGENTS OF THE UNIVERSITY OF MINNESOTA,
Patent Owner.

IPR2017-01068
Patent 5,859,601 B2

Before JENNIFER S. BISK, ROBERT J. WEINSCHENK, and
CHARLES J. BOUDREAU, *Administrative Patent Judges*.

BISK, *Administrative Patent Judge*.

DECISION
Granting Institution of *Inter Partes* Review
35 U.S.C. § 314

I. INTRODUCTION

LSI Corporation and Avago Technologies U.S. Inc. (“Petitioner”) filed a Petition requesting an *inter partes* review of claims 1, 2, 8, 10, 12–17, and 21 of U.S. Patent No. 5,859,601 B2 (Ex. 1001, “the ’601 patent”). Paper 1 (“Pet.”). Regents of the University of Minnesota (“Patent Owner”), identified as the owner of and real party in interest to the ’601 patent (Paper 3, 2), did not file a Preliminary Response. Paper 34 (Patent Owner’s Waiver of Preliminary Response). On February 14, 2020, Patent Owner filed a statutory disclaimer of claims 1–12, 15, 16, and 21. Ex. 2001. Thus, this Decision considers only Petitioner’s challenges to claims 13, 14, and 17, the only remaining challenged claims of the ’601 patent. *See* 37 C.F.R. § 42.107(e) (“No *inter partes* review will be instituted based on disclaimed claims.”)

Institution of an *inter partes* review is authorized by statute when “the information presented in the petition filed under section 311 and any response filed under section 313 shows that there is a reasonable likelihood that the petitioner would prevail with respect to at least 1 of the claims challenged in the petition.” 35 U.S.C. § 314(a) (2012). Based on our review of the record, we conclude that Petitioner is reasonably likely to prevail with respect to each of claims 13, 14, and 17.

II. BACKGROUND

A. Related Matters

The parties indicate that the ’601 patent is involved in litigation, *Regents of the University of Minnesota v. LSI Corporation and Avago*

Technologies U.S. Inc., No. 0:16-cv-02891-WMW-SER (D. Minn).¹ Pet. 69; Paper 3, 2.

B. The '320 Patent

The '601 patent, titled “Method and Apparatus for Implementing Maximum Transition Run Codes,” issued January 12, 1999. Ex. 1001, codes (45), (54). The '601 patent relates generally to “a channel coding technique to improve data storage devices such as magnetic computer disk drives and professional and consumer tape recorders.” *Id.* at 2:40–43. In particular, the '601 patent describes using maximum transition-run (“MTR”) coding to eliminate the storage of certain binary data patterns determined to be error-prone. *Id.* at 2:43–47. According to the '601 patent, using MTR coding significantly improves the final bit error rate. *Id.* at 2:47–49.

The '601 patent describes MTR coding as “impos[ing] a limit on the maximum number of consecutive transitions that can occur in the written magnetization pattern in magnetic recording.” *Id.* at 2:59–61. In particular, performance is improved most significantly “when the maximum number of consecutive transitions [referred to as ‘constraint length j’] is limited to two.” *Id.* at 2:62–65.

In addition to MTR coding, the '601 patent describes prior art coding methods, such as Runlength limited (“RLL”) codes, which “impose a (d,k) constraint on the recorded data sequence.” *Id.* at 1:21–24. In describing RLL codes, the '601 patent describes two commonly used formats for recording binary data that in turn dictate the permissible values of d and k,

¹ On February 7, 2018, this case was transferred to the Northern District of California as No. 5:18-cv-00821-EJD (N.D. Cal.).

(1) Non-Return-to-Zero (“NRZ”) in which “the binary ‘1’ represents a positive level in the magnetization waveform and the binary ‘0’ [represents a] negative level in the same waveform,” and (2) Non-Return-to-Zero-Inversion (“NRZI”) in which a 1 represents a magnetic transition and a 0 represents no transition. *Id.* at 1:24–36. For NRZ formatting, $d+1$ defines the minimum number of consecutive like symbols and $k+1$ defines the maximum number of consecutive like symbols in the sequence. *Id.* at 1:24–29. For NRZI formatting, “ d and k are the minimum and maximum number of consecutive 0’s between any two 1’s, respectively.” *Id.* at 1:29–36.

According to the ’601 patent, RLL (1, k) codes, which do not allow consecutive transitions, eliminate some patterns that cause the most errors. *Id.* at 4:53–5:17. However, this coding allows for fewer patterns overall, resulting in a lower code rate and increasing inefficiency. *Id.* at 4:18–24. MTR coding, on the other hand, “eliminate[s] all sequences with three or more consecutive transitions, but allow[s] the dibit pattern to survive,” which eliminates error-prone patterns with less inefficiency than a RLL (1, k) code. *Id.* at 4:24–30. MTR parameters are written as (j ; k) where j is the MTR constraint described above and “ k is the usual RLL constraint.” *Id.* at 4:46–48.

C. Illustrative Claim

Independent claim 13 is illustrative of the subject matter at issue and reads as follows:

13. A method for encoding m -bit binary datawords into n -bit binary codewords in a recorded waveform, where m and n are

preselected positive integers such that n is greater than m , comprising the steps of:

- receiving binary datawords; and
- producing sequences of n -bit codewords;
- imposing a pair of constraints ($j;k$) on the encoded waveform;
- generating no more than j consecutive transitions of said sequence in the recorded waveform such that $j \geq 2$; and
- generating no more than k consecutive sample periods of said sequences without a transition in the recorded waveform.

Ex. 1001, 10:46–61.

D. Proposed Grounds of Unpatentability

Petitioner asserts the following grounds of unpatentability, each based on 35 U.S.C. § 103(a)²:

Claims Challenged	35 U.S.C. §	Reference
13, 14, 17	102	Okada ³
13, 14, 17	102	Tsang ⁴

Pet. 2. Petitioner also relies on the Declaration of Emina Soljanin, Ph.D. Ex. 1010 (“Soljanin Decl.”).

² Because the application from which the ’320 patent issued was filed before March 16, 2013, the effective date of the relevant amendment, the pre-AIA version of § 103 applies. The Leahy-Smith America Invents Act (“AIA”), Pub. L. No. 112-29, 125 Stat. 284, 287–88 (2011), amended 35 U.S.C. § 103.

³ U.S. 5,392,270 (issued Feb. 21, 1995) (Ex. 1007).

⁴ U.S. 5,731,768 (filed Jan. 31, 1996; issued March 24, 1998) (Ex. 1009).

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
