POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] Not applicable.

BACKGROUND OF THE INVENTION

1. Field of the Invention

[0002] This invention relates to power control in a mobile radio system or wireless communication system, and more particularly, to controlling received power levels in a code division multiple access (CDMA) radio system.

2. Description of the Prior Art

[0003] Typically, radio signals transmitted with increased power result in fewer errors when received than signals transmitted with decreased power. Unfortunately, signals transmitted with excessive power may interfere with the reception of other signals sharing the radio link. Wireless communication systems employ power control schemes to maintain a target error rate of a signal received on a radio link.

[0004] If a received signal includes a rate of errors far above a target error rate, the received signal may result in an undesirable effect on a delivered service. For example, excessive errors may lead to broken voice during voice calls, low throughput over data links, and glitches in displayed video signals. On the other hand, if the received signal includes a rate of errors well below the target error rate, the mobile radio system is not efficiently using its radio resources. A very low error rate may mean that a signal is transmitted with an excessive level of power and that user could be provided a higher data rate. Alternatively, if the power level of a signal is sufficiently reduced, additional users may be serviced. If data rates are increased, a user may receive a higher level of service. Therefore, if a target error rate for each user is met within a tolerance threshold, a radio resource may be more optimally used.

[0005] A wireless communication system often employ one of either an open loop scheme or a closed loop scheme to control uplink transmit power of a mobile radio. Uplink typically refers to the radio link from a mobile radio to a base station, where as the downlink typically refers to the link from the base station to the mobile radio. A mobile radio is not necessarily mobile and may also be referred to as a mobile, a user, user equipment (UE), a terminal or terminal equipment. A base station may also be referred to as a Node-B.

[0006] The error rate is related to a received signal to noise-plus-interference ratio (SNIR); a higher SNIR generally results in a lower error rate; and conversely, a lower SNIR generally results in a higher error rate. The exact relationship between SNIR and error rate, however, is often a function of several factors including radio channel type and the speed at which a mobile is travelling.

[0007] A target error rate is often reached using a two stage process, which includes an outer loop and an inner loop. A first process may operate as an outer loop and may be tasked to adjust a target received SNIR (SNIR Target). This first process tracks changes in the relationship between SNIR and error rate. The outer loop sets an SNIR Target that is generally used several times by the inner loop. Periodically, the outer loop may adjust or update this SNIR Target used by the inner loop. For example, if an actual error rate exceeds a desired error rate, the outer loop may increase the value of the SNIR Target.

[0008] A second process operates as an inner loop and tries to force the link to exhibit the SNIR Target determined by the outer loop. The inner loop may operate by closed loop or by open loop means.

[0009] In the open loop method of the inner loop process, a UE uses an SNIR Target value that is derived by the network and signalled to the UE. The inner loop running in the UE attempts to maintain the SNIR Target. The UE uses the information signalled to it and monitors the received strength of signals it receives to determine a power level at which it will transmit. Advantageously, this open loop method compensates for fast channel fading by determining the path loss on a per frame bases and by adjusting the transmit power accordingly. Unfortunately, this open loop method is relatively slow at compensating for changes due to interfering signals from other transmitters.

[0010] In the closed loop method of the inner loop process, a closed loop scheme operates to match an SNIR Target. A received SNIR measurement is made by the network on an uplink signal. The SNIR measurement is compared within the network to the SNIR Target value. The inner loop drives the system to match the SNIR Target by issuing transmit power control commands from the network to a UE. The commands instruct the UE to increase or decrease its transmitted power by a predetermined step dB amount. Unfortunately, such closed loop methods demand a very high command update rate to adequately compensate for fast channel fading because of the single-dB-step commands used. At slower update rates, fast channel fading is not tracked adequately since a large number of iterations and long delays are needed to compensate for a change in power that is substantially larger than the dB-step value.

[0011] Both the closed loop scheme and the open loop scheme have their disadvantages. Therefore, an improved method and system are needed that better balances the conflicting goals of reducing errors in a received signal while also reducing interference imposed on signals received at other receivers. An improved method and system are also needed to better reduce the overall residual SNIR fluctuations experienced by each users signal at a receiver.

BRIEF SUMMARY OF THE INVENTION

[0012] Some embodiments provide a method of power control in a radio communications system, the method comprising: determining a path loss of a radio channel between a base station and a remote transceiver; receiving a transmit power control (TPC) command transmitted to the remote transceiver from the base station; and calculating a transmit power level for the remote transceiver based on the path loss and the TPC command.

[0013] Some embodiments provide a method of power control in a radio communications system, the method comprising: receiving a signal at a second transceiver transmitted from a first transceiver; measuring a power level of the received signal; receiving a transmit power control (TPC) command at the second transceiver transmitted from the first transceiver; and calculating a transmit power level for the second transceiver based on the power level of the received signal and the TPC command.

[0014] Some embodiments provide a method of uplink power control in a CDMA radio communications system, the method comprising: receiving an uplink signal; determining an error metric of the uplink signal; updating an SNIR target based on the error metric;measuring a received SNIR of the uplink signal; comparing the measured received SNIR with the SNIR target; assigning a first value to a step indicator if the measured received SNIR is greater than the SNIR target, and assigning a second value to a step indicator if the measured received SNIR is less than the SNIR target; transmitting a transmit power control (TPC) command instructing a transmitter to adjust an uplink transmit power level based on the step indicator; receiving the TPC command including the step indicator; accumulating the step indicator value; broadcasting a downlink signal including an indication of a downlink power level, wherein the signal is transmitted at the downlink power level; measuring the received power of the downlink signal; and setting a transmit power level base on the received power level, the indication of the downlink power level, and the accumulated step indicator value.

[0015] Some embodiments provide a method comprising: measuring a power level of a received signal; receiving a transmit power control (TPC) command; and calculating a transmit power level based on the power level of the received signal and the TPC command.

[0016] Some embodiments provide a radio comprising: a receiver including an output to provide a measured received power level; an accumulator having an input for accepting step increase and decrease instructions and an output providing a sum of past step instructions; a power level setting circuit coupled to the accumulator output and coupled to the receiver output, wherein the power level setting circuit sets a transmit power bases on the accumulator output and the measured received power level; and a transmitter, wherein the transmitter transmits a signal at the set transmit power.

[0017] Other features and aspects of the invention will become apparent from the following detailed description, taken in conjunction with the accompanying drawings which illustrate, by way of example, the features in accordance with embodiments of the invention. The summary is not intended to limit the scope of the invention, which is defined solely by the claims attached hereto.

BRIEF DESCRIPTION OF THE DRAWINGS

[0018] FIGURE 1 shows a block diagram of a wireless communication system.

[0019] FIGURE 2 illustrates a wireless communication system using an open loop scheme.

[0020] FIGURE 3 illustrates a wireless communication system using a closed loop scheme.

[0021] FIGURE 4 illustrates a wireless communication system using elements of both open loop and closed loop schemes, in accordance with the present invention.

[0022] FIGURES 5A, 5B and 5C each illustrate a simulated probability density function of the received SNIR in the network.

DETAILED DESCRIPTION OF THE INVENTION

[0023] In the following description, reference is made to the accompanying drawings which illustrate several embodiments of the present invention. It is understood that other embodiments may be utilized and mechanical, compositional, structural, electrical and operational changes may be made without departing from the spirit and scope of the present disclosure. The following detailed description is not to be taken in a limiting sense, and the scope of the embodiments of the present invention is defined by the claims of the issued patent.

[0024] Some portions of the detailed description which follows are presented in terms of procedures, steps, logic blocks, processing, and other symbolic representations of operations on data bits that can be performed on computer memory. A procedure, computer executed step, logic block, process etc., are here conceived to be a self-consistent sequence of steps or instructions leading to a desired result. The steps are those utilizing physical manipulations of physical quantities. These quantities can take the form of electrical, magnetic, or radio signals capable of being stored, transferred, combined, compared, and otherwise manipulated in a computer system. These signals may be referred to at times as bits, values, elements, symbols, characters, terms, numbers, or the like. Each step may be performed by hardware, software, firmware, or combinations thereof.

[0025] FIGURE 1 shows a block diagram of a wireless communication system. A network 100 may include one or more base station controllers 120, such as a radio network controller (RNC), and one or more base stations 110, such as a Node-B, wherein each Node-B is connected to an RNC. The network 100 communicates with one or more users 140, 150 through a channel 160, also referred to as a radio link, created between a base station and a user.

[0026] Two mechanisms are primarily responsible for changes in the SNIR of a signal travelling through a radio link.

[0027] First, changes in the channel affect the SNIR. The instantaneous path loss between a base station and a user may vary as the user changes position or the user's environment changes. Rapid changes may occur as a result of a transmitted signal combining constructively and destructively as the signal travels along multiple paths from a base station and to the user. Additionally, slower changes may occur due to attenuation of the radio waves with increased distance between the base station and the user. Slower changes may also occur due to signal obstruction by buildings, vehicles and hills.

[0028] Second, signals from other transmitters affect the SNIR. For example, signals intended for other mobile radios or other base stations may increase interference in the radio link and thus reduce a received signal's SNIR.

[0029] In Time Division Duplex (TDD) systems, both uplink and downlink share the same carrier frequency. Due to this reciprocity in the links, path loss measurements made on the downlink by a mobile radio may be used estimate the path loss on the uplink. That is, a measured downlink path loss may be used to estimate the uplink path loss. The estimated uplink path loss will be less reliable with the passing of time but may be adequate within a frame period. Therefore, a mobile radio may determine a transmit power level for an uplink transition that compensates for an estimated uplink path loss, thereby providing a received signal to a base station at an expected input power level.

[0030] Downlink path loss measurements may be facilitated by a beacon channel, which is transmitted from a base station at a reference power level. A mobile radio is informed of the actual transmit power level being used by the base station for the beacon channel. In addition to knowing the actual transmit power level of a beacon channel, the mobile radio may measure a received signal power level. By measuring the received signal power level, the mobile radio can compute a downlink path loss as the difference between the actual transmit power level and the received signal power level. Thus, the mobile radio is able to estimate the uplink path loss in a channel between the base station and the mobile radio and properly set its uplink transmit power level.

[0031] The path loss calculation may be updated as often as a beacon signal is transmitted and received. In a UTRA TDD system in compliance with the third generation partnership project (3GPP) specifications, a beacon signal is transmitted either once or twice every 10 milliseconds (ms). If an uplink transmission follows a beacon transmission within a relatively short period of time, a mobile radio can compensate for the fast fluctuations (fast-fading) in a radio channel. Such is the case for mobiles travelling at slow to moderate speeds if a beacon signal is transmitted either once or twice every 10ms and the uplink transmissions occur in the intervening period.

[0032] Additionally, a radio channel may be adversely affected by changes in interference levels over time. These temporal interference changes may be accommodated by a base station measuring and communicating interference levels seen in each uplink timeslot. In a UTRA TDD system, a table having values of the measured interference for each timeslot may be broadcast to all users via a Broadcast Channel (BCH). The broadcasted information may be updated approximately every 16 frames (160 ms) depending upon the system configuration. In other embodiments, a mobile radio may receive this interference table as a signalled message directed to the individual mobile radio.

[0033] The 3GPP specifications describe two separate schemes for power control of uplink channels: an open loop scheme and a closed loop scheme. For example, in 3GPP 3.84 Megachips per second (Mcps) TDD systems, open loop power control is specified for all uplink channels. In 3GPP 1.28 Mcps TDD systems, open loop power control is specified only for physical random access channels (PRACH). Also defined by 3GPP is an implementation of a closed loop power control scheme. For example, see 3GPP recommendations for UTRA TDD systems operating at 1.28 Mcps for non-PRACH uplink channels.

[0034] In a wireless communication system using an open loop scheme, a network and UE use an outer loop to update and signal to the UE an SNIR Target value, thereby influencing the UE's transmit power. The network updates the SNIR Target value to be signalled based upon an observed error rate on the uplink. Once received, the mobile radio takes into account the signalled SNIR Target value when deriving a transmit power level that it will apply to the next uplink signal transmitted.

[0035] In a 3GPP 3.84 Mcps system incorporating an open loop scheme, a network instructs the UE with an SNIR Target value. The network also signals its beacon transmit power level and may also provide a measure of uplink interference for each timeslot as measured by the network. The UE receives an input signal that is typically a combination of attenuated versions of the network signal, which passed through a radio channel, along with interfering signals from other transmitters. The UE measures the received power level of the attenuated network signal and determines a path loss of the radio channel. The UE also decodes the signalled SNIR Target value from the network signal. The UE computes a transmit power level based on the SNIR Target value, the determined path loss and, if available, the uplink interference measurements.

[0036] FIGURE 2 illustrates a wireless communication system using an open loop scheme. A UE transmits 200 user data at a determined transmit power level. An uplink signal 202, which includes user data 204, propagates through the radio link. The network receives an attenuated version of the transmitted signal. The network measures 207 an uplink interference value and determines 206 an error metric of the uplink signal. The network may use the measured uplink interference value to update 208 an interference measurement table. The interference measurement table may include average measured interference levels for each uplink timeslot.

[0037] The network also uses the error metric to update 210 an SNIR Target value. The network transmits 212 SNIR Target in a signalling message on the downlink 214, which includes the SNIR Target 216. The UE receives and saves 220 the SNIR Target. The network also broadcasts 222 a beacon signal on the downlink 224. The downlink 224 propagates the signal, which includes an indication of the beacon power level 226, over the radio link. The network may also broadcast the interference measurements 228. The UE measures 230 the received power level and saves 232 the interference measurements for later processing.

[0038] With the measured power level and the signalled beacon power level, the UE may determine a path loss. The UE may use the saved received SNIR Target 216, the saved received interference measurements 228 and the computed path loss to set 234 a transmit power level. This transmit power level may be used by transmitter 200 to set the power level of transmitted user data 204 on the uplink 202.

[0039] The 3GPP specifications also define a closed loop scheme. For example, a 3GPP 1.28 Mcps system employs a closed loop scheme using an outer loop and an inner loop. The closed loop TPC scheme is the primary power control mechanism used for all non-PRACH channels in a 1.28 Mcps TDD system. The closed loop TPC scheme is not currently employed for the uplink of 3.84 Mcps TDD systems.

[0040] The outer loop determines an SNIR Target value and the inner loop uses the SNIR Target value. The outer loop includes network components that determine an error metric, such as a bit error rate, a block error rate or a CRC error count, on uplink traffic from UEs. This error metric is used to set and update an SNIR Target value. An inner loop includes network components that use the SNIR Target value computed and set by the outer loop. The network measures a received SNIR value of the uplink signal.

[0041] Next, a comparator determines whether the measured SNIR value is greater than or less than the SNIR Target value. If the measured SNIR value is greater than the SNIR Target value, the network signals a transmit power control (TPC) command on the downlink instructing the UE to reduce its current transmitter power by a step value (e.g., 1 dB). On the other hand, if the measured SNIR value is less than the SNIR Target value, the network signals a TPC command instructing the UE to increase its current transmitter power by the step dB value.

[0042] In a system employing only a closed loop power control scheme, several TPC commands may be necessary to properly bring the UE's transmitted power in line with the SNIR Target value. For example, if a path loss increases from one frame to the next by 15 dB, the system will take 15 TPC commands to compensate for the 15 dB fade. A UE accumulates the increase and decrease TPC commands to determine a proper uplink transmit power level. By increasing and decrease uplink power levels of each UE, a network attempts to control the power level of each UE such that the ratio of the received uplink energy level per transmitted bit to the spectral density of the noise and interference signals is a constant value. This TPC command adjustment process is performed for each UE in a cell. The constant value, however, may be non-uniform among the UEs depending upon the configuration of the system.

[0043] In a closed loop TPC scheme, the inner loop SNIR is maintained via a closed loop method using binary feedback. The feedback indicates either power up or power down. Every time a TPC command is received an integrator in the UE is used within the inner loop to update the UE transmit power by a step amount +/-Δ dB. The TPC commands themselves are derived by the network and are signalled to the UE via a downlink channel. When calculating the proper TPC command to send, the network measures the received SNIR and compares this measured value to an SNIR Target value. If the SNIR is too low, an up command is sent. If the SNIR is too high, a down command is sent. The target SNIR value is updated by the outer loop based upon the observed error performance of the link. In this way, both the inner and outer feedback loops are closed by the TPC signalling.

[0044] FIGURE 3 illustrates a wireless communication system using a closed loop scheme. The closed loop scheme includes an outer loop in which a UE transmits 300 user data over the radio link in an uplink signal 302 that contain the user data 304. The network determines 306 an error metric of the received uplink signal. Using the error metric, the network computes and updates 308 an SNIR Target value.

[0045] The closed loop scheme also includes an inner loop in which the network measures 310 the received SNIR of the uplink signal 302. The network compares 312 the measured SNIR with the SNIR Target determined in the outer loop. The inner loop generates and transmits 314 a TPC command based on the comparison 312. A downlink signal 316 carries the TPC command 318 over the radio link. The UE accumulates 320 the TPC commands and uses the accumulated TPC commands to set 322 a transmit power for future uplink transmissions 300.

[0046] A mobile radio system employing either an open loop scheme or a closed loop scheme has its advantages and disadvantages.

[0047] The open loop scheme advantageously adapts quickly to path loss changes. If the path loss is observed to have worsened, for example by 15 dB in one 10 ms interval, the transmit power may be adjusted accordingly. A further advantage is that the open loop may continue to be partially updated in the absence of user-specific feedback signalling. For example, when a UE does not receive updated SNIR Target values, the outer loop pauses but changes in the path loss may continue to be tracked.

[0048] Disadvantageously, the timeslot interference level update rate in an open loop system is relatively slow. Therefore, a system using an open loop scheme is slower to adapt to interference changes than a system using the closed loop scheme. A further disadvantage of the open loop scheme is that interference is considered to be the same for all UEs in a particular uplink timeslot. That is, each UE assigned to a timeslot uses the same interference measurement signalled by the base station on the BCH. A commonly used interference measurement table makes assumptions about the statistical nature of the interference and does not consider the individual cross-correlation properties of the uplink channelization codes. It is thus left to the outer loop to compensate for these effects, but unfortunately on a slow basis.

[0049] Conversely, the closed loop only scheme is less able to adapt to fast path loss changes because the closed loop can only move by a step Δ dB during each update. Thus, if the path loss has changed between updates by 15 dB and the step Δ dB value is only 1 dB, the closed loop is not able to adjust quickly since it can move only by 1 dB during each cycle. Therefore, for the same update rate (e.g., once per 10 ms), a closed loop TPC scheme is less able to track the fast fading observed in common mobile radio channels. Furthermore, the closed loop may not be updated during a pause in transmission of the TPC commands.

[0050] Advantageously, the closed loop is relatively quick to respond to uplink interference changes since both path loss and interference are accommodated by the same loop. The closed loop scheme using TPC commands has a further advantage in that it allows for per-user interference adaptation, in contrast to the open loop scheme, which broadcasts an average interference table for each timeslot.

[0051] In accordance with the present invention, aspects of both an open loop scheme and a closed loop scheme are strategically combined to form a power control method. Some embodiments of the present invention advantageously combine elements of both open loop and closed loop schemes to control power levels, thereby avoiding one or more of the disadvantages associated with either of the separately used schemes.

[0052] In accordance with some embodiments of the present invention, a UE incorporates the TPC structure of a closed loop scheme and the path loss estimation structure of an open loop scheme. Some embodiments of the present invention allow for both relatively quick adaptation to fast fading and also allow for per-user interference adaptation, and retain the ability to partially update the power control loop even in the temporary absence of TPC commands.

[0053] Some embodiments of the present invention require modifications to one or more elements of a standard mobile radio system. For example, some embodiments require changes to just a UE, while other embodiments require modifications to just the network. Embodiments that modify a UE but not the network allow the UE of the present invention to operate with legacy base stations. Similarly, embodiments that modify the network but not the UE allow the network of the present invention to operate with legacy UEs. Still other embodiments of the present invention require modification to both the network and the UE. Embodiments modifying standard network elements may include changes to just a base station but not a radio network controller (RNC). Other embodiments modify both a base station and an RNC.

[0054] Some embodiments of the present invention, incorporate a loop having three components: an open loop component located in the UE, an SNIR comparison loop located in the network, and an SNIR update component also located in the network.

[0055] First, an open loop component may be located in the UE and driven by measured beacon received power levels and path loss calculations. This loop tries to adapt to all instantaneous path loss changes on a per-beacon transmission basis. The partial power calculated by this loop is a function of the beacon signal transmission power (P_{Tx}) and the beacon received signal code power (RSCP) and is denoted $P_{open}(k)$, where k represents the current frame number. P_{Tx} is known to the UE and derived from the base station signalled power level (428, FIGURE 4) and the measured power level for frame k, ($RSCP(k)$), may be determined by the UE receiver (432, FIGURE 4). $P_{open}(k)$ may also be a function of a constant value (C) to ensure that the transmission arrives at an appropriate power level.

$$P_{open}(k) = P_{Tx} - RSCP(k) + C$$

[0056] Second, an SNIR comparison loop is located in the network, such as in the Node-B. The SNIR comparison loop is driven by received SNIR metrics. A received SNIR is compared to a SNIR Target value, which is set by an outer loop. A comparison result leads to the signalling of a TPC command that is signalled to the UE to change its transmit power. Binary signalling may used, such that the TPC command indicates a change in transmission power by a fixed amount either up or down. Alternately, a multi-level TPC command may be used.

[0057] Third, an outer loop is located in the network, such as in the Node-B or RNC. The outer loop is driven by the data error statistics observed on the uplink transmissions. The outer loop is responsible for setting an SNIR Target level for the SNIR comparison loop.

[0058] An optional auxiliary process in the UE adjusts the transmit power based upon: (a) γ_{SF}, the spreading factor (SF) of the physical channel; and (b) β_{TFC}, the selected transport format (TFC).

[0059] Thus, for the current frame k, the UE may calculate the transmit power $P_{Tx}(k)$ as shown below where K is the initial frame number determined when the power control process begins; TPC_i is -1 for a down TPC command, $+1$ for an up TPC command and 0 if no TPC command is received; and *step* is the magnitude of the amount added to an accumulator upon receipt of each TPC command. The transmit power $P_{Tx}(k)$ may be updated for every frame period. Alternatively, the transmit power $P_{Tx}(k)$ may be updated each time a new TPC command is received. Alternatively, the transmit power $P_{Tx}(k)$ may be updated only when either a TPC command or a new power level is received from the network.

$$P_{Tx}(k) = P_{open}(k) + step \cdot \sum_{i=k-K}^{k} TPC_i + \gamma_{SF} + \beta_{TFC}$$

[0060] An embodiment of a power control scheme, in accordance with the present invention, is shown diagrammatically in FIGURE 4. The γ_{SF} and β_{TFC} adjustment factors are not shown for diagrammatical clarity.

[0061] FIGURE 4 illustrates a wireless communication system using elements of both open loop and closed loop schemes, in accordance with the present invention. A UE transmits 400 user data at a determined transmit power level. An uplink signal 402, which includes the user data 404, propagates through the radio link. The network receives an attenuated version of the transmitted signal.

[0062] The network determines 406 an error metric of the uplink signal 402. Optionally, the network measures an uplink interference level and may update 422 an interference measurement table. Data measured or computed from uplink measurements may be entered into the interference measurement table. The interference measurement table may include average measured interference levels for each uplink timeslot. Within the network the error metric may be used to update 408 an SNIR Target value.

[0063] The network also transmits 424 a beacon signal. The downlink signal 426, which includes an indication of the beacon transmit power level 428, propagates over the radio link. Optionally, the network may broadcast the interference measurements 430. The UE saves 432 the signalled power level, measures the received power level and, if available, saves 434 the interference measurements for later processing.

[0064] As in a closed loop scheme, a UE transmits 400 user data over the radio link in an uplink signal 402 that contain the user data 404. The network determines 406 an error metric of the received uplink signal. Using the error metric, the network computes and updates 408 an SNIR Target value.

[0065] The network also measures 410 the received SNIR of the uplink signal 402. The network compares 412 the measured SNIR with the determined SNIR Target. The network generates and transmits 414 a TPC command based on the comparison 412. A downlink signal 416 carries the TPC command 418 over the radio link. The UE accumulates 420 the TPC commands and uses the accumulated TPC commands in part to set 436 the transmit power level for future uplink transmissions 400.

[0066] As in an open loop scheme, with the measured power level and the signalled beacon power level, the UE may determine a path loss $P_{open}(k)$. The UE may use the saved received interference measurements *I(k)* to adjust the transmission power following a pause in transmission or following a pause in receipt of TPC commands. The UE may use the accumulated TPC commands $\sum_{i=k-K}^{k} TPC_i$ the computed path loss $P_{open}(k)$, adjustment factors γ_{SF} & β_{TFC} and optionally, adjustments based upon *I(k)* to set 436 a transmit power level. This transmit power level $P_{Tx}(k)$ may be used to set the uplink power level of transmitted 400 user data on the uplink 402.

[0067] The downlink signal 426, which contains the power level 428 and may contain the interference measurements 430, is broadcast in a cell. Previous UEs using a closed loop scheme do not use measurements of the downlink received power while monitoring the power level signalling in a beacon broadcast to set the uplink transmission power. Similarly, previous UEs using a closed loop scheme do not compute or do not use computations of the downlink path loss while processing TPC commands. A previous UE simply follows the TPC commands as it is instructed to set its transmit power level. If a network instructs a known UE to increase its transmit power by one step amount, the previous UE shall increase its power level by one step amount.

[0068] In accordance to the present invention, a UE may receive a TPC command instructing it to change its transmit power by one step level in a particular direction, but the UE may actually change its transmit power level by a different amount or in fact an amount in the opposite direction. The UE uses the TPC only as a factor in determining whether to increase transmit power level, decrease transmit power level or leave the transmit power level unchanged.

[0069] For example, assume a UE just transmitted a burst to a Node-B at 20 dBm over a radio link with a path loss of 110 dB. The received power at the Node-B receiver would be –90 dBm, which is the difference between 20 dBm and a loss of 110 dB. Next, assume the Node-B wants to receive an uplink signal from the UE at –89 dBm. The Node-B would signal and the UE would receive a TPC command instructing the UE to increase the uplink transmit power level by 1 dB. Also assume that the path loss improves from the previous frame to this frame by +10 dB (e.g., from 110 dB to 100 dB).

[0070] A previous UE would transmit the next burst at +21 dBm, which is the sum of the previous level (+20 dBm) and the step increase (1 dB). The transmitted +21 dBm signal would probably reach the Node-B at –79 dBm, a signal level that is +10 dB too great because the channel improvement was not taken into account.

[0071] In accordance with the present invention, a UE would account for the new path loss. The previous transmit power level of +20 dBm would be decreased by +10 dB to account for the improved channel path loss of +10 dB. The resulting transmit power level would then be +10 dBm. The UE also accounts for the TPC command by adjusting the transmit power level by the desired step of +1 dB, resulting in a new transmit power level of +11 dBm, which both accounts for the improved channel (+10 dB) and accommodates the Node-B's desire to have a received signal with a step increase (+1 dB). The +11 dBm would reach the Node-B at the desired level of –89 dBm if the channel pathloss estimate was accurate. As shown in this example, the transmit power level dropped 9 dB (from +20 dBm to +11 dBm) even though the Node-B TPC command instructed an increase of 1 dB.

[0072] Therefore, even though a UE receives a network TPC command instructing it to step up or down its uplink transmit power by 1 dB, the UE may actually change the transmit power level by a different amount. In fact, the UE transmit power level may change in a direction opposite of the TPC command as exemplified above.

[0073] During a period of inactivity on the uplink 402, TPC commands 418 may not have been received by the UE. The UE transmit power level for a subsequent initial transmission 400 may be determined using current updates of the open loop component. That is, the initial transmit power level may be determined based on the beacon power level 428, the measured 432 received power level, and optionally the interference measurements 430. The open loop component does not require feedback, thus may continue to be updated every beacon transmission even during the uplink transmission pause.

[0074] The history stored in the TPC accumulator may be stale. In some circumstances the history may be considered useful and is not reset. Alternatively, the accumulated TPC history could be used to set the uplink transmit power level but with some excess power margin added to ensure a clean start to the loop. Alternatively, the UE may decide to discard the accumulated TPC history and to reset it to a default or initial value. The default or initial value may optionally be based upon a received interference measurement table 430.

[0075] The ability of the open loop component to compensate for fast fading is a function of the channel speed and the delay between the beacon timeslot and the uplink timeslots. Open loop control is often effective at pedestrian speeds as well as at higher speeds if the uplink slots are placed close in time to the beacon. At high mobile speeds, it is likely that power control performance will be improved if beacon RSCP filtering is enabled at the UE. The UE is responsible for detecting whether or not filtering should be applied to the open loop component. Automatic detection of the channel speed may be performed by the UE in order to control the enabling of RSCP filtering. In some embodiments of the present invention, a UE disables a combined open loop/closed loop scheme operating in accordance with the present invention when a UE passes a threshold value indicative of mobile speed.

[0076] Simulations have been performed to illustrate the performance advantages of some embodiments of the present invention. The radio channel simulated here represents an ITU indoor to outdoor and pedestrian model B channel as described in ITU-R M.1225 Guidelines for Evaluation of Radio Transmission Technologies for IMT-2000. The outer loop SNIR target was based upon a 1% error rate. A residual SNIR error term observed at the base station was monitored.

[0077] FIGURES 5A, 5B and 5C each illustrate a simulated probability density function of the received SNIR in the network. In each of the simulations, approximately 10,000 received SNIR values are sampled. Simulation results for each scenario are grouped and collected into bins. The vertical axis shows a number of occurrences for a particular range (bin) of received SNIR values. A sampled received SNIR value that fall within a range defined by a bin is counted as an occurrence for that bin.

[0078] FIGURE 5A shows simulation results for a system using only an open loop scheme. In this plot, the bin width is approximately 0.42 dB. The simulation results show a system good at tracking fast fading in the channel, but not as able to track the interference variations included in the simulation. These values are only updated at the UE via signalling every 160 ms. As such, the error term shows considerable variance at the receiver.

[0079] FIGURE 5B shows simulation results for a system using only a closed loop scheme. In this plot, the bin width is approximately 0.48 dB. The simulation results show a system better able to track the interference changes, but not as able to track the path loss due to being limited in response to the TPC command +/– 1 dB step size.

[0080] FIGURE 5C shows simulation results for a system combining aspects of both open and closed loop schemes (as shown in FIGURE 4). In this plot, the bin width is approximately 0.24 dB. The simulation results show a system able to respond to both path loss and interference changes. Additionally, the residual SNIR error term shows less variance. The plot shows that the variance of this distribution is considerably reduced for the combined power control scheme.

[0081] For the above simulations (using the same fading and interference profiles for each loop method), the following mean transmit powers were obtained:

Power Control Method	**Mean Transmit Power for 1% BLER**
Open Loop: (FIGURE 2)	5.76 dB
Closed Loop: (FIGURE 3)	5.48 dB
Combined Loops: (FIGURE 4)	3.59 dB

Table 1 – Performance of Power Control Schemes

[0082] For the simulated channel and interference scenario, the combined scheme is able to maintain a 1% block error rate (BLER) using 2.17 dB less power than the open loop scheme and 1.89 dB less power than the closed loop scheme. In a real system, this power saving may equate to greater cell coverage, higher uplink capacity and throughput, and increased battery life. The magnitude of the gains may change with different channel speeds, types and interference profiles but the performance of the combined should be better than both the open loop and closed loop schemes when used individually.

[0083] In terms of signalling overhead, the combined scheme helps to avoid a need to signal SNIR Target and interference levels on downlink channels, and has a similar signalling efficiency as the closed loop scheme. In some embodiments, the signalling efficiency is 1 bit per update.

[0084] In a system using the combined power control scheme, a new physical channel on the downlink may be used to carry fast allocation and scheduling information to a user, thereby informing the UE of the uplink resources that it may use. This new physical channel could also be used as the feedback channel for the combined power control scheme. For example, an allocation/scheduling channel could carry TPC commands. Alternatively, the combined scheme may be applied to existing channel types (dedicated or shared uplink physical channels) for UTRA TDD as well as to other TDD systems.

[0085] Some embodiments of the present invention control uplink power levels and may be incorporated into a UE with supporting features incorporated into a base station. For example, a Node-B or RNC may be implemented with a new parameter, either included in a signalling command or a broadcast message, where the new parameter instructs a UE to enable or disable the setting of uplink transmit power level based on both the path loss estimation and the TPC commands. A parameter may indicate whether a UE is to use open loop power control, closed loop power control or a combined scheme.

[0086] Some embodiments of the present invention operate with a downlink signal including both a TPC command and an indication of the downlink transmit power level. In these embodiments, the downlink signal provides both downlinks 416 and 430 (FIGURE 4) in one signal. A UE may receive one physical channel that it decodes for TPC commands, decodes for downlink power level indications, and measures for received power levels. In these embodiments, the UE measures a power level of a received signal, receives a TPC command, and calculates a transmit power level based on the power level of the received signal and the TPC command.

[0087] While the invention has been described in terms of particular embodiments and illustrative figures, those of ordinary skill in the art will recognize that the invention is not limited to the embodiments or figures described. For example, the combined uplink power control scheme described above may be implemented a mirror image for controlling downlink power. In this case, functions performed by the UE for a combined uplink scheme may be performed by the network. Similarly, functions performed by the network for the combined uplink scheme may be performed by the UE.

[0088] The figures provided are merely representational and may not be drawn to scale. Certain proportions thereof may be exaggerated, while others may be minimized. The figures are intended to illustrate various implementations of the invention that can be understood and appropriately carried out by those of ordinary skill in the art.

[0089] Therefore, it should be understood that the invention can be practiced with modification and alteration within the spirit and scope of the appended claims. The description is not intended to be exhaustive or to limit the invention to the precise form disclosed. It should be understood that the invention can be practiced with modification and alteration and that the invention be limited only by the claims and the equivalents thereof.

CLAIMS

What is claimed is:

1. A method of power control in a radio communications system, the method comprising:

determining a path loss of a radio channel between a base station and a remote transceiver;

receiving a transmit power control (TPC) command transmitted to the remote transceiver from the base station; and

calculating a transmit power level for the remote transceiver based on the path loss and the TPC command.

2. The method of power control of claim 1, the method further comprising transmitting an uplink signal from the remote transceiver at the calculated transmit power level.

3. The method of power control of claim 1, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

4. The method of power control of claim 3, wherein determining the path loss further includes computing a difference between the signalled transmit power level and the measured received power level.

5. The method of power control of claim 1, the method further comprising:

generating the TPC command; and

transmitting the TPC command from the base station.

6. The method of power control of claim 1, wherein the calculating the transmit power level is additionally based on an adjustment factor.

7. The method of power control of claim 6, wherein the adjustment factor incorporates a spreading factor parameter.

8. The method of power control of claim 6, wherein the adjustment factor incorporates a selected transport format parameter.

9. A method of power control in a radio communications system, the method comprising:

receiving a signal at a second transceiver transmitted from a first transceiver;

measuring a power level of the received signal;

receiving a transmit power control (TPC) command at the second transceiver transmitted from the first transceiver; and

calculating a transmit power level for the second transceiver based on the power level of the received signal and the TPC command.

10. A method of uplink power control in a CDMA radio communications system, the method comprising:

receiving an uplink signal;

measuring a received SNIR of the uplink signal;

comparing the measured received SNIR with an SNIR target;

assigning a first value to a step indicator if the measured received SNIR is greater than the SNIR target, and assigning a second value to a step indicator if the measured received SNIR is less than the SNIR target;

transmitting a transmit power control (TPC) command instructing a transmitter to adjust an uplink transmit power level based on the step indicator;

receiving the TPC command including the step indicator;

accumulating the step indicator value;

broadcasting a downlink signal including an indication of a downlink power level, wherein the signal is transmitted at the downlink power level;

measuring the received power of the downlink signal; and

setting a transmit power level based on the received power level, the indication of the downlink power level, and the accumulated step indicator value.

11. The method of power control of claim 10, further comprising:

determining an error metric of the uplink signal;

updating the SNIR target based on the error metric;

measuring an interference value in the received uplink signal; and

updating an interference measurement table with the interference value;

wherein broadcasting the downlink signal further includes the interference measurement table; and

wherein setting the transmit power level is further based on a value in the interference measurement table.

12. A method comprising:

measuring a power level of a received signal;

receiving a transmit power control (TPC) command; and calculating a transmit power level based on the power level of the received signal and the TPC command.

13. A radio comprising:

a receiver including an output to provide a measured received power level;

an accumulator having an input for accepting step increase and decrease instructions and an output providing a sum of past step instructions;

a power level setting circuit coupled to the accumulator output and coupled to the receiver output, wherein the power level setting circuit sets a transmit power bases on the accumulator output and the measured received power level; and

a transmitter, wherein the transmitter transmits a signal at the set transmit power.

ABSTRACT

A method, system and apparatus for setting a transmit power control level in a wireless communication system. Aspects of both open loop and closed loop transmit power control schemes are used to determine a transmit power level. A method includes measuring a power level of a received signal, receiving a transmit power control (TPC) command, and calculating a transmit power level based on the power level of the received signal and the TPC command.

NOTICE TO FILE MISSING PARTS OF NONPROVISIONAL APPLICATION

FILED UNDER 37 CFR 1.53(b)

Filing Date Granted

Items Required To Avoid Abandonment:

An application number and filing date have been accorded to this application. The item(s) indicated below, however, are missing. Applicant is given **TWO MONTHS** from the date of this Notice within which to file all required items and pay any fees required below to avoid abandonment. Extensions of time may be obtained by filing a petition accompanied by the extension fee under the provisions of 37 CFR 1.136(a).

- The oath or declaration is missing.
  A properly signed oath or declaration in compliance with 37 CFR 1.63, identifying the application by the above Application Number and Filing Date, is required.
- To avoid abandonment, a late filing fee or oath or declaration surcharge as set forth in 37 CFR 1.16(e) of $130 for a non-small entity, must be submitted with the missing items identified in this letter.

SUMMARY OF FEES DUE:

Total additional fee(s) required for this application is **$130** for a Large Entity

- **$130** Late oath or declaration Surcharge.

Replies should be mailed to: Mail Stop Missing Parts
Commissioner for Patents
P.O. Box 1450
Alexandria VA 22313-1450

A copy of this notice MUST be returned with the reply.

PATENT
Docket No. 562492000500

DECLARATION FOR UTILITY PATENT APPLICATION

AS A BELOW-NAMED INVENTOR, I HEREBY DECLARE THAT:

My residence, post office address, and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor of the subject matter which is claimed and for which a patent is sought on the invention entitled: POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM, the specification of which is attached hereto unless the following box is checked:

☒ was filed on August 12, 2004 as United States Application Serial No. 10/917,968.

I HEREBY STATE THAT I HAVE REVIEWED AND UNDERSTAND THE CONTENTS OF THE ABOVE-IDENTIFIED SPECIFICATION, INCLUDING THE CLAIMS, AS AMENDED BY ANY AMENDMENT REFERRED TO ABOVE.

I acknowledge the duty to disclose information which is material to the patentability as defined in 37 C.F.R. § 1.56.

I hereby claim foreign priority benefits under 35 U.S.C. § 119(a)-(d) or § 365(b) of any foreign application(s) for patent or inventor's certificate, or § 365(a) of any PCT International application which designated at least one country other than the United States listed below and have also identified below, by checking the box, any foreign application for patent or inventor's certificate, or PCT International application having a filing date before that of the application on which priority is claimed:

Application No.	Country	Date of Filing	Priority Claimed?
			☐Yes ☐No

I hereby claim benefit under 35 U.S.C. § 119(c) of any United States provisional application(s) listed below:

Application Serial No.	Filing Date

I hereby claim the benefit under 35 U.S.C. § 120 of any United States application(s), or § 365(c) of any PCT International application designating the United States, listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States or PCT International application in the manner provided by the first paragraph of 35 U.S.C. § 112, I acknowledge the duty to disclose information which is material to patentability as defined in 37 C.F.R. § 1.56 which became available between the filing date of the prior application and the national or PCT International filing date of this application.

Application Serial No.	Filing Date	Status
		☐Patented ☐Pending ☐Abandoned

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under § 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

STATEMENT UNDER 37 CFR 3.73(b)

Applicant/Patent Owner: Nicholas William ANDERSON

Application No./Patent No.: 10/917,956 Filed/Issue Date: August 12, 2004

Entitled: POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM

IPWireless, Inc. , a corporation
(Name of Assignee) (Type of Assignee, e.g., corporation, partnership, university, government agency, etc.)

states that it is:

1. [X] the assignee of the entire right, title, and interest; or
2. [ ] an assignee of less than the entire right, title and interest.
   The extent (by percentage) of its ownership interest is ______ %

in the patent application/patent identified above by virtue of either:

A. [x] An assignment from the inventor(s) of the patent application/patent identified above. The assignment was recorded in the United States Patent and Trademark Office at Reel ________ , Frame ________ . or for which a copy thereof is attached.

OR

B. [ ] A chain of title from the inventor(s), of the patent application/patent identified above, to the current assignee as shown below:

1. From: ____________ To: ____________
   The document was recorded in the United States Patent and Trademark Office at Reel ________ , Frame ________ , or for which a copy thereof is attached.
2. From: ____________ To: ____________
   The document was recorded in the United States Patent and Trademark Office at Reel ________ , Frame ________ , or for which a copy thereof is attached.
3. From: ____________ To: ____________
   The document was recorded in the United States Patent and Trademark Office at Reel ________ , Frame ________ , or for which a copy thereof is attached.

[ ] Additional documents in the chain of title are listed on a supplemental sheet.

[ ] Copies of assignments or other documents in the chain of title are attached.
[NOTE: A separate copy (*i.e.*, the original assignment document or a true copy of the original document) must be submitted to Assignment Division in accordance with 37 CFR Part 3, if the assignment is to be recorded in the records of the USPTO. See MPEP 302.08]

The undersigned (whose title is supplied below) is authorized to act on behalf of the assignee.

ASSIGNMENT
SOLE

THIS ASSIGNMENT, by Nicholas William ANDERSON (hereinafter referred to as the assignor), residing at 72 London Road, Warmley, Bristol, BS30 5JL, United Kingdom, witnesseth:

WHEREAS, said assignor has invented certain new and useful improvements in POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM, set forth in an application for Letters Patent of the United States, bearing Serial No. 10/917,968 filed on August 12, 2004; and

WHEREAS, IPWireless Inc., a corporation duly organized under and pursuant to the laws of Delaware and having its principal place of business at 1001 Bayhill Dr., Second Floor, San Bruno, California 94066 (hereinafter referred to as the assignee) is desirous of acquiring the entire right, title and interest in and to said inventions and said application for Letters Patent of the United States, and in and to any Letters Patent or Patents, United States or foreign, to be obtained therefor and thereon:

NOW, THEREFORE, in consideration of One Dollar ($1.00) and other good and sufficient consideration, the receipt of which is hereby acknowledged, said assignor has sold, assigned, transferred and set over, and by these presents does sell, assign, transfer and set over, unto said assignee, its successors, legal representatives and assigns, the entire right, title and interest in and to the above-mentioned inventions, application for Letters Patent, and any and all Letters Patent or Patents in the United States of America and all foreign countries which may be granted therefor and thereon, and in and to any and all divisions, continuations and continuations-in-part of said application, or reissues or extensions of said Letters Patent or Patents, and all rights under the International Convention for the Protection of Industrial Property, the same to be held and enjoyed by said assignee, for its own use and the use of its successors, legal representatives and assigns, to the full end of the term or terms for which Letters Patent or Patents may be granted, as fully and entirely as the same would have been held and enjoyed by the assignor, had this sale and assignment not been made.

AND for the same consideration, said assignor hereby covenants and agrees to and with said assignee its successors, legal representatives and assigns, that, at the time of execution and delivery of these presents, said assignor is the sole and lawful owner of the entire right, title and interest in and to said inventions and the application for Letters Patent above-mentioned, and that the same are unencumbered and that said assignor has good and full right and lawful authority to sell and convey the same in the manner herein set forth.

AND for the same consideration, said assignor hereby covenants and agrees to and with said assignee, its successors, legal representatives and assigns, that said assignor will, whenever counsel of said assignee, or the counsel of its successor, legal representatives and assigns, shall advise that any proceeding in connection with said inventions, or said application for Letters Patent, or any proceeding in connection with Letters Patent for said inventions in any country, including interference proceedings, is lawful and desirable, or that any division, continuation or continuation-in-part of any application for Letters Patent or any reissue or extension of any Letters Patent, to be obtained thereon, is lawful and desirable, sign all papers and documents, take all lawful oaths, and do all acts necessary or required to be done for the procurement, maintenance, enforcement and defense of Letters Patent for said inventions, without charge to said assignee, its successors, legal representatives and assigns, but at the cost and expense of said assignee, its successors, legal representatives and assigns.

AND said assignor hereby requests the Commissioner of Patents to issue said Letters Patent of the United States to said assignee as the assignee of said inventions and the Letters Patent to be issued thereon for the sole use of said assignee, its successors, legal representatives and assigns.

INFORMATION DISCLOSURE STATEMENT UNDER 37 C.F.R. § 1.97 & 1.98

MS Amendment
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Dear Sir:

Pursuant to 37 C.F.R. §1.97 and § 1.98, Applicant submits for consideration in the above-identified application the documents listed on the attached Form PTO/SB/08a/b. Copies of foreign documents are submitted herewith. The Examiner is requested to make these documents of record.

This Information Disclosure Statement is submitted:

☐ With the application; accordingly, no fee or separate requirements are required.

☐ Before the mailing of a first Office Action after the filing of a Request for Continued Examination under § 1.114. However, if applicable, a certification under 37 C.F.R. § 1.97 (e)(1) has been provided.

sf-2287279

☒ **Within three months of the application filing date or before mailing of a first Office Action on the merits; accordingly, no fee or separate requirements are required. However, if applicable, a certification under 37 C.F.R. § 1.97 (e)(1) has been provided.**

☐ After receipt of a first Office Action on the merits but before mailing of a final Office Action or Notice of Allowance.

- ☐ A fee is required. A check in the amount of __ is enclosed.
- ☐ A fee is required. Accordingly, a Fee Transmittal form (PTO/SB/17) is attached to this submission in duplicate.
- ☐ A Certification under 37 C.F.R. § 1.97(e) is provided above; accordingly; no fee is believed to be due.

☐ After mailing of a final Office Action or Notice of Allowance, but before payment of the issue fee.

- ☐ A Certification under 37 C.F.R. § 1.97(e) is provided above and a check in the amount of __ is enclosed.
- ☐ A Certification under 37 C.F.R. § 1.97(e) is provided above and a Fee Transmittal form (PTO/SB/17 is attached to this submission in duplicate.)

Applicant would appreciate the Examiner initialing and returning the Form PTO/SB/08a/b, indicating that the information has been considered and made of record herein.

The information contained in this Information Disclosure Statement under 37 C.F.R. § 1.97 and § 1.98 is not to be construed as a representation that: (i) a complete search has been made; (ii) additional information material to the examination of this application does not exist; (iii) the information, protocols, results and the like reported by third parties are accurate or enabling; or (iv) the above information constitutes prior art to the subject invention.

(54) CDMA reception apparatus and received signal power measuring apparatus in CDMA mobile communication system

(57) In a CDMA reception apparatus, averaging means (412) for averaging at least one of vector, amplitude and power of received signal of a plurality of transmit power control sections is provided. Further, propagation path variation estimation means (407) for estimating a propagation path variation of the present transmit power control section from respective transmit power control sections in the past to obtain a propagation path variation estimation value (408) and propagation path variation correction means (multiplier) for correcting by the propagation path variation estimation value (408) are further provided, wherein the averaging means (412) averages at least one of vector, amplitude and power of received signal of the plurality of transmit power control sections corrected by the propagation path variation correction means (multiplier). With this configuration, the measurement accuracy is improved by measuring received signal power using a plurality of slots including past slots, more accurate transmit power control is performed, thereby achieving improved communication quality, a reduced transmit power, and an increased capacity.

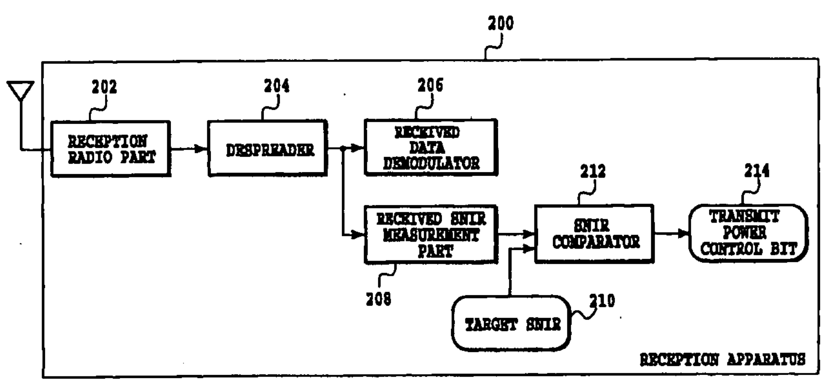

FIG.2

EP 1 071 227 A2

Description

[0001] The present invention relates to a mobile communication reception apparatus in mobile communications applied with digital radio communication system, particularly with CDMA (code division multiple access) system, more specifically to received signal power measurement for transmit power control.

[0002] An example of relationship between flow of transmit power control of CDMA mobile communication system by the prior art and radio slot configuration is schematically shown in Fig. 1.

[0003] As shown in Fig. 1, 1) received signal power measurement is performed for each transmit power control section (hereinafter referred to as "slot"), 2) the measurement result is subjected to a division calculation using a measurement result of noise interference power to obtain a received SNIR (signal power to interference power ratio), the received SNIR is compared with a reference SNIR, 4) a transmit power control bit is transmitted designating a transmit power control indicator of the received side channel, so that when the comparison result exceeds the reference SNIR, a base station transmit power is decreased, or when the comparison result is below the reference SNIR, the base station transmit power is increased.

[0004] As shown in Fig. 1, in the traffic channel, there exists not only a fixed transmit part (shaded in Fig. 1) in which the number of transmit bits is unchanged, but also a variable transmit part in which the transmit bit number is successively changed according to a change in information speed of transmitted data, when there is no data, transmit is stopped. In this case, the fixed transmit part is applied to received signal power measurement.

[0005] As shown above, received signal power measurement in a CDMA reception apparatus is performed using a fixed transmit part, however, there is a problem that when signal power of the fixed transmit part is small, measurement accuracy of received signal power is deteriorated, and transmit power control is not performed with good accuracy.

[0006] As described above, accuracy degradation of transmit power control has resulted in an increase in transmit power and deterioration of channel capacity.

[0007] An object of the present invention is to improve the measurement accuracy by measuring received signal power using a plurality of slots including past slots, thereby performing even more accurate transmit power control. With this, the object is to achieve improvement of communication quality, reduction of transmit power and increase of capacity.

[0008] Further, when using received signals of a plurality of slots including past slots in measurement of received power, measurement accuracy is improved when the traveling speed of the mobile terminal is slow since the propagation path variation is small, however, when the traveling speed of the mobile terminal is high, since the propagation path variation is large, there is a possibility that the measurement accuracy is deteriorated. As shown, the number of slots used for received signal power measurement suitable for accuracy is varied with the traveling speed. Further, to use signals of past slots for measurement of received signal power, by averaging a result of multiplying a change in variation of propagation path and a change in transmit power changed by transmit power control from a past to present, measurement accuracy can be improved. In particular, other than a dedicated traffic channel which is applied to transmit power control, in a downlink here channel reception of a common channel of fixed transmit power is possible such as a pilot channel, it is possible to estimate propagation path variation using the common channel. However, as there is a variation in propagation path or as estimation accuracy of change in transmit power is degraded, there may be a case where received signal power measurement accuracy is deteriorated by using past slot signals for measurement. In particular, when the fixed transmit part in the above-described slot is large, since many measurable received signals are present in 1 slot, the accuracy is better than averaging many slots, when the number of slots to be averaged is small, or in some case, when there is only one slot to be averaged. Still further, also in a downlink, when the propagation path of common channel is different from the propagation path of a dedicated traffic channel such as in the case where a transmit adaptive array antenna is applied to the transmit side, that is, the base station side, propagation path estimation is difficult, and there may be a case where the accuracy is deteriorated by using a plurality of slots of the past. As shown, the optimum number of slots used for received signal power measurement is changed.

[0009] Then, an object of the present invention is to achieve received signal power measurement suitable for respective systems and propagation environments by changing the number of averaging slots according to traveling speed, channel format, and system details without changing the algorithm, improve the measurement accuracy, achieve a reduction of transmit power and an increase of capacity, and suppress complexity of reception apparatus, especially complexity of mobile communication terminal apparatus.

[0010] In accordance with the present invention which attains the above objects, there is provided a received signal power measurement using a plurality of past slots for improving measurement accuracy of received signal power, making a transmit power control highly accurate, thereby enabling high communication quality, reduction of transmit power, and increased capacity. Further, by changing the number of averaging slots according to the traveling speed, channel format, and system details, it is possible to perform received signal power measurement suitable for respective environments without changing the algorithm, thereby reducing the transmit power, increasing the capacity and suppressing the size of the reception apparatus.

[0011] The CDMA reception apparatus and received signal power measurement method described in respective claims are as what follows.

[0012] In a first aspect of the present invention, there is provided a CDMA reception apparatus comprising:

propagation path variation estimation means for estimating a propagation path variation in a present transmit power control section from respective transmit power control sections in the past to obtain a propagation path variation estimation value;
propagation path variation correction means for correcting at least one of vector, amplitude and/or power of a received signal of the plurality of transmit power control sections with the propagation path variation estimation value obtained by the propagation path variation estimation means; and
averaging means for averaging at least one of vector, amplitude and/or power of received signal of the plurality of transmit power control sections corrected by the propagation path variation correction means.

[0013] According to the present invention, by using a plurality of slots including past slots for received signal power measurement, measurement accuracy of received signal power can be improved. Further, when using the past slots for received signal power measurement, by making a correction using an estimation value of propagation path variation from the past slot timing up to the present timing, it is possible to perform received signal power measurement more accurately.

[0014] In a second aspect of the present invention, there is provided a CDMA reception apparatus comprising:

transmit power changing amount estimation means for estimating a changing amount of transmit power of a communication partner station varied by transmit power control in the present transmit power control section from respective transmit power control sections in the past;
transmit power changing amount correction means for correcting at least one of vector, amplitude and/or power of a received signal of the plurality of transmit power control sections with the transmit power changing amount estimation value obtained by the transmit power changing amount estimation means; and
averaging means for averaging at least one of vector, amplitude and/or power of received signal of the plurality of transmit power control sections corrected by the transmit power changing amount correction means.

[0015] According to the present invention, when using the past slots for received signal power measurement, by correcting using a change amount of transmit power from the past slot timing up to the present timing, it is possible to perform received signal power measurement more accurately.

[0016] The averaging means may be provided with vector addition means for performing vector addition;

division means for dividing a vector added by the vector addition means with a number of vectors added; and
means for converting vector divided by the division means into a power.

[0017] According to the present invention, when averaging received signals of a plurality of slots including past slots, by performing averaging by vector addition, it is possible to suppress effects of noise and measurement accuracy of received signal power can be improved.

[0018] The averaging means may be provided with

amplitude addition means for performing amplitude addition;
division means for dividing an amplitude added by the amplitude addition means with a number of amplitudes added; and
means for converting amplitude divided by the division means into a power.

[0019] According to the present invention, when averaging received signals of a plurality of slots including past slots, by performing averaging by amplitude addition, simpler and more accurate averaging is possible.

[0020] The averaging means may be provided with power addition means for performing power addition;

division means for dividing a power added by the power addition means with a number of powers added.

[0021] According to the present invention, when averaging received signals of a plurality of slots including past slots, by performing averaging by power addition, simpler and more accurate averaging is possible.

[0022] The propagation path variation estimation means may estimate a propagation path variation using a channel not performing transmit power control.

[0023] According to the present invention, when estimating propagation path variation, by using a channel not performing transmit power control (for example, common channel or the like), propagation path variation estimation of high accuracy can be performed.

[0024] The transmit power changing amount estimation means may estimate a transmit power changing amount using a transmit power control indicator transmitted from own station.

[0025] According to the present invention, when estimating a transmit power changing amount, by using a transmit power control indicator (for example, transmit power control bit) transmitted from its own station, a high accuracy transmit power changing amount estimation is possible.

[0026] The averaging means may further comprise averaging section setting means for setting an averaging section.

[0027] According to the present invention, by selecting an appropriate averaging section according to the system details and propagation environment, it is possible to perform measurement of received signal power suited to environment without changing the algorithm.

[0028] The averaging section setting means may comprise:

means for setting the averaging section to a small section, when performing communication by a channel of which a power allocated to a signal subjected to received signal power measurement existing in each transmit power control section is high; and
means for setting the averaging section to a large section, when performing communication by a channel of which a power allocated to a signal subjected to received signal power measurement existing in each transmit power control section is small.

[0029] According to the present invention, depending on the power of received signal subjected to received signal power measurement existing between respective transmit power control sections, when the power is high, the averaging section is reduced to decrease effects of error of past received signals, or when the power is low, the averaging section is increased to reduce effects of measurement error due to noise, it is possible to set an averaging section for optimum measurement accuracy.

[0030] The averaging section setting means may comprise:

means for setting the averaging section to a large section, when a partner transmit station performs transmit power control, there is a channel other than channel transmitting to the received station and transmitting a channel not performing transmit power control with the same antenna and directivity, and propagation path variation estimation using the channel not performing transmit power control is possible; and
means for setting the averaging section to a small section, when a partner transmit station performs transmit power control, there is not a channel other than channel transmitting to the reception station and transmitting a channel not performing transmit power control with the same antenna and directivity, or even when transmitting but not performing transmit power control, and propagation path variation estimation using the channel not performing transmit power control is not possible.

[0031] According to the present invention, when estimation of propagation path variation is impossible, since when signals of past slots are used, received power measurement accuracy is deteriorated due to effects of propagation path variation, it is possible to reduce the averaging section and enhance the measurement accuracy.

[0032] The averaging section setting means may comprise:

traveling speed detection means for detecting a relative traveling speed between a communication partner station and own station; and
means for setting the averaging section to a small section when the detected traveling speed is large, and for setting the averaging section to a large section when the detected traveling speed is small.

[0033] According to the present invention, when a traveling speed is high between the opposite transmit station and the own station, by decreasing the averaging section, it is possible to prevent deterioration of received signal power measurement accuracy due to propagation path variation.

[0034] In a third aspect of the present invention, there is provided a received signal power measurement method of a CDMA reception apparatus, comprising:

a propagation path variation estimation step for estimating a propagation path variation in a present transmit power control section from respective transmit power control sections in the past to obtain a propagation path variation estimation value;
a propagation path variation correction step for correcting at least one of vector, amplitude and/or power of a

received signal of the plurality of transmit power control sections with the propagation path variation estimation value obtained by the propagation path variation estimation step; and

an averaging step for averaging at least one of vector, amplitude and/or power of received signal of the plurality of transmit power control sections corrected by the propagation path variation correction step.

[0035] According to the present invention, by using a plurality of slots including past slots for received signal power measurement, received signal power measurement accuracy can be improved. Further, when using past slots for received signal power measurement, by correcting using an estimation amount of propagation path variation from the past slot timing up to the present timing, it is possible to perform received signal power measurement more accurately.

[0036] In a fourth aspect of the present invention, there is provided a received signal power measurement method of a CDMA reception apparatus, comprising:

a transmit power changing amount estimation step for estimating a changing amount of transmit power of a communication partner station varied by transmit power control in the present transmit power control section from respective transmit power control sections in the past;

a transmit power changing amount correction step for correcting at least one of vector, amplitude and/or power of a received signal of the plurality of transmit power control sections with the transmit power changing amount estimation value obtained by the transmit power changing amount estimation step; and

an averaging step for averaging at least one of vector, amplitude and/or power of received signal of the plurality of transmit power control sections corrected by the transmit power changing amount correction step.

[0037] According to the present invention, when using past slots for received signal power measurement, by correcting using an estimation value of change amount of transmit power from the past slot timing up to the present timing, it is possible to perform received signal power measurement more accurately.

[0038] The averaging step may be provided with a vector addition step for performing vector addition;

a division step for dividing a vector added by the vector addition step with a number of vectors added; and

a step for converting vector divided by the division step into a power.

[0039] According to the present invention, when averaging received signals of a plurality of slots including past slots, by performing averaging by vector addition, it is possible to suppress effects of noise and measurement accuracy of received signal power can be improved.

[0040] The averaging step may be provided with an amplitude addition step for performing amplitude addition;

a division step for dividing an amplitude added by the amplitude addition step with a number of amplitudes added; and

a step for converting amplitude divided by the division step into a power.

[0041] According to the present invention, when averaging received signals of a plurality of slots including past slots, by performing averaging by amplitude addition, simpler and more accurate averaging is possible.

[0042] The averaging step may be provided with a step for performing power addition;

a division step for dividing a power added by the power addition step with a number of powers added.

[0043] According to the present invention, when averaging received signals of a plurality of slots including past slots, by performing averaging by power addition, simpler and more accurate averaging is possible.

[0044] The propagation path variation estimation step may estimate a propagation path variation using a channel not performing transmit power control.

[0045] According to the present invention, when estimating propagation path variation, by using a channel not performing transmit power control (for example, common channel or the like), propagation path variation estimation of high accuracy can be performed.

[0046] The transmit power changing amount estimation step may estimate a transmit power changing amount using a transmit power control indicator transmitted from own station.

[0047] According to the present invention, when estimating a transmit power changing amount, by using a transmit power control indicator (for example, transmit power control bit) transmitted from its own station, a high accuracy transmit power changing amount estimation is possible.

[0048] The averaging step may further comprise an averaging section setting step for setting an averaging section.

[0049] According to the present invention, by selecting an appropriate averaging section according to the system details and propagation environment, it is possible to perform measurement of received signal power suited to environment without changing the algorithm.

[0050] The averaging section setting step may comprise:

a step for setting the averaging section to a small section, when performing communication by a channel of which a power allocated to a signal subjected to received signal power measurement existing in each transmit power control section is high; and
a step for setting the averaging section to a large section, when performing communication by a channel of which a power allocated to a signal subjected to received signal power measurement existing in each transmit power control section is small.

[0051] According to the present invention, depending on the power of received signal subjected to received signal power measurement existing between respective transmit power control sections, when the power is high, the averaging section is reduced to decrease effects of error of past received signals, or when the power is low, the averaging section is increased to reduce effects of measurement error due to noise, it is possible to set an averaging section for optimum measurement accuracy.

[0052] The averaging section setting step may comprise:

a step for setting the averaging section to a large section, when a partner transmit station performs transmit power control, there is a channel other than channel transmitting to the reception station and transmitting a channel not performing transmit power control with the same antenna and directivity, and propagation path variation estimation using the channel not performing transmit power control is possible; and
a step for setting the averaging section to a small section, when a partner transmit station performs transmit power control, there is not a channel other than channel transmitting to the reception station and transmitting a channel not performing transmit power control with the same antenna and directivity, or even when transmitting but not performing transmit power control, and propagation path variation estimation using the channel not performing transmit power control is not possible.

[0053] According to the present invention, when estimation of propagation path variation is impossible, since when signals of past slots are used, received power measurement accuracy is deteriorated due to effects of propagation path variation, it is possible to reduce the averaging section and enhance the measurement accuracy.

[0054] The averaging section setting step may comprise:

a step for detecting a relative traveling speed between a communication partner station and own station; and
a step for setting the averaging section to a small section when the detected traveling speed is large, and for setting the averaging section to a large section when the detected traveling speed is small.

[0055] According to the present invention, when a traveling speed is high between the opposite transmit station and the own station, by decreasing the averaging section, it is possible to prevent deterioration of received signal power measurement accuracy due to propagation path variation.

[0056] The above and other objects, effects, features and advantages of the present invention will become more apparent from the following description of embodiments thereof taken in conjunction with the accompanying drawings.

[0057] In the following, embodiments of the present invention will be described with reference to the drawings.

[0058] The present invention can be applied to a base station reception apparatus as an uplink receiver, however, because the above-described estimation of propagation path variation can be performed by a channel not performing the transmit power control, an example of downlink receiver, that is, a case where a reception apparatus of a mobile communication terminal is used will be described as the following embodiment.

(Embodiment 1)

[0059] Fig. 2 is a block diagram showing an example of construction of a reception apparatus in a CDMA mobile terminal in the embodiment 1 of the present invention.

[0060] A reception apparatus 200 includes a reception radio part 202, a despreader 204, a received data demodulator 206, a received SNIR measurement part 208 and a SNIR comparator 212.

[0061] The reception radio part 202 receives a radio signal transmitted from a radio base station, performs frequency conversion and filtering, and outputs a baseband signal.

[0062] In the despreader 204, despreading of the baseband signal is performed, and a received despread signal is outputted to the received data decoder 206 and a received SNIR calculator 208.

[0063] In the received data demodulator 206, RAKE combining, error correction decoding and the like are performed to demodulate the received data. At the same time, the received despread signal is inputted to the received SNIR measurement part 208 to output a received SNIR at every slot, a comparison of the outputted value with a target SNIR 210 is performed in the SNIR comparator 212, according to the comparison result, a transmit power control bit 214 (transmit power control indicator) to be transmitted is outputted.

[0064] Fig. 3 is a block diagram showing an example of construction of the received SNIR measurement part 208 in Fig. 2.

[0065] The received SNIR measurement part 208 comprises a received signal power measurement part 304, a noise interference power measurement part 306 and a divider 308.

[0066] The received despread signal 302 outputted from the despreader 204 is inputted respectively to the received signal power measurement part 304 and the received noise interference power measurement part 306, and the respective measurement results A and B are divided in the divider 308 to obtain a received SNIR 310.

[0067] Figs. 4A and 4B is a block diagram showing an example of construction of the received signal power measurement part 304 in Fig. 3.

[0068] Here, in Figs. 4A and 4B, alphabet n shows a present number of slots, and K a maximum number of received signal slots for performing averaging.

[0069] The received signal power measurement part 304 includes a RAKE combiner 404, a delayer 406, a propagation path estimator 407, a transmit power changing amount estimator 409, an averaging part 412, a received signal power calculator 407, and an averaging section setting part 416.

[0070] The received despread signal 402 of fixed transmit part of the dedicated traffic channel is RAKE combined by the RAKE combiner 404, and an average value of received signal of each slot is stored in the delayer 406. The stored value can be any of vector, amplitude and/or power. Received signal of past slots stored in the delayer 406 is multiplied by the multiplier with the propagation path variation estimation value 408 of the past slot timing and the present timing generated in the propagation path estimator 407. Further, after multiplication by the multiplier with the estimation value 410 of changing amount of transmit power by transmit power control of the past slot timing and the present timing, averaging is performed along with the present slot in the averaging part 412. Still further, when the stored value is vector or amplitude, it is converted into power by the received signal power calculator 414, and outputted as received signal power.

[0071] In the averaging section setting part 416, as will be described later, the averaging section is appropriately set according to the propagation environment and environment of the system in communication.

[0072] Fig. 10 is a flow chart showing an example of operation of the received signal power measurement part 304.

[0073] First, received despread signal 402 of fixed transmit part of a dedicated traffic channel is RAKE combined by the RAKE combiner 404 (step S1002).

[0074] Next, an average value of received signal of each slot is stored in the delayer 406 (step S1004). The stored value can be any of vector, amplitude and/or power.

[0075] Next, in the propagation path estimator 407, propagation path variation in the present transmit control section is estimated from information of respective past transmit power control sections to obtain a propagation path variation estimation value 408 (step S1006).

[0076] Next, at least one of vector, amplitude and/or power of received signals of a plurality of transmit power control sections is corrected by multiplying using the propagation path variation estimation value 408 obtained by the propagation path estimator 407 (step S1008).

[0077] Next, in the transmit power changing amount estimator 409, a changing amount of transmit power changed by transmit power control of the communication partner station in the present transmit power control section is estimated from information of past respective transmit power control sections (for example, past transmit power control bit data stored in any of storage apparatus (not shown) in the reception apparatus) to obtain a transmit power changing amount estimation value 410 (step S1010).

[0078] Next, at least one of vector, amplitude and/or power of received signals of a plurality of transmit power control sections is corrected by multiplying using the transmit power changing amount estimation value 410 obtained by the transmit power changing amount estimator 409 (step S1012).

[0079] Next, in the averaging part 412, at least one of vector, amplitude and/or power of the corrected received signals of the plurality of transmit power control sections is averaged (step S1014).

[0080] Next, an averaging section setting method in the averaging section setting part 416 will be described with reference to Fig. 8.

[0081] First, for example, the amount of power allocated to the fixed transmit part of signal from the communication partner station corresponding to the shaded part in Fig. 1 is judged from the channel format in communication (step S802), setting is made so that the averaging section is decreased when the power is large (step S804), or the averaging section is increased when the power is small (step S806). Alternatively, a judgment is made from informed information from the system as to whether or not there is a common channel transmitted without performing transmit power with the same antenna and directivity and propagation path estimation is possible (step S808), when propagation path estimation is possible the averaging section is increased (step S810), or when propagation path estimation is impossible the averaging section is decreased (step S812). On the other hand, when propagation path estimation is not performed, traveling speed of the traveling machine is detected (step S814), when the traveling speed is high and variation of propagation path is large, the averaging section is set small (step S816), or when the traveling speed is low and variation of propagation path is small, the averaging section is set large (step S818).

[0082] Fig. 5 is a block diagram showing an example of construction of the propagation path estimator 407 in Figs. 4A and 4B.

[0083] Here, alphabet n in Fig. 5 shows a present slot number, and K a slot number of largest received signal for averaging.

[0084] The propagation path estimator 407 includes a delayer 504 and a divider 506.

[0085] In the propagation path estimator 407, amplitude of a received signal 502 after RAKE combining of the common channel not performing transmit power control is stored in the delayer 504 for each slot, by performing division calculation A/B of the received signal A of the present slot and the received signal B of respective past slot in the divider 506, thereby outputting a propagation path variation estimation value 508 of the present slot from the past respective slots.

[0086] Fig. 6 is a block diagram showing an example of construction of the transmit power changing amount estimator 409 in Figs. 4A and 4B.

[0087] Here, alphabet n in Fig. 6 shows a present slot number, and K a slot number of largest received signal for averaging.

[0088] The transmit power changing amount estimator 409 includes a transmit power changing amount converter 604 and a delayer 606.

[0089] The transmit power changing amount estimator 409 estimates a changing amount of transmit power from a radio base station from the transmit power control bit 602 transmitted by the mobile terminal to the radio base station.

[0090] First, in the transmit power changing amount converter 604, the transmit power control bit 602 transmitted from the mobile terminal is converted into a transmit power changing amount in consideration of the transmit power control bit to obtain a transmit power control estimation value 608. Next, output after changing is multiplied with the transmit power changing amount from each slot timing up to the present stored in the delayer 606 to obtain a new transmit power control estimation value 608.

(Embodiment 2)

[0091] In the following, an embodiment 2 according to the present invention will be described with reference to Fig. 7.

[0092] Fig. 7 is a block diagram showing an example of construction of a received signal power measurement part in the embodiment 2 of the present invention. In the receiver, construction other than the received signal power measurement part is similar to that in the embodiment 1.

[0093] A received signal power measurement part 700 in the embodiment 2 includes an α multiplier 702, a delayer 704, a propagation path estimator 705, a transmit power changing amount estimator 707, a received signal power calculator 710, an averaging section setting part 712, a RAKE combiner 716 and a 1-α multiplier 718.

[0094] The delayer 704, the propagation path estimator 705, the transmit power changing amount estimator 707, the received signal power calculator 710, the averaging section setting part 712, and the RAKE combiner 716 have the same functions as those described in Figs. 4 to 9, and the α multiplier 702 and the 1-α multiplier respectively have functions for multiplying the input with α or 1-α.

[0095] The received signal power measurement part 700 has a form of a feedback type filter which performs averaging of the received signal of the present slot and the received signal of the past slot using a forgetting factor α 702. That is, for the received signal of the past slot stored in the delayer 704, after multiplication with the propagation path variation estimation value 706 between 1 slot previous timing and the present timing and the transmit power changing amount estimation value 708, it is multiplied with the forgetting factor α in the α multiplier 702 to perform averaging with the received signal of the present slot. In the received signal power calculator 710, a received signal power is calculated from received signal after averaging and the result is outputted. On the other hand, received signal after averaging is stored again in the delayer 704. In the averaging section setting part 712, α is appropriately set according to the propagation environment and details of the system in communication.

[0096] Next, setting method of the forgetting factor α will be described with reference to Fig. 9.

[0097] First, for example, the amount of power allocated to the fixed transmit part of signal from the communication partner station corresponding to the shaded part in Fig. 1 is judged from the channel format in communication (step S902), setting is made so that α is decreased when the power is large (step S904), or α is increased when the power is small (step S906). Alternatively, a judgment is made from informed information from the system as to whether or not there is a common channel transmitted without performing transmit power with the same antenna and directivity and propagation path estimation is possible (step S908), when propagation path estimation is possible α is increased (step S910), or when propagation path estimation is impossible α is decreased (step S912). On the other hand, when propagation path estimation is not performed, traveling speed of the traveling machine is detected (step S914), when the traveling speed is high and variation of propagation path is large, α is set small (step S916), or when the traveling speed is low and variation of propagation path is small, α is set large (step S918).

(Effects of the Invention)

(Effects of embodiment 1)

[0098] As shown in Fig. 3, by obtaining the received signal power by averaging a plurality of slots including past slots, even when the fixed transmit part included in 1 slot is small, the effective measurement bit number can be increased, and received power measurement of higher accuracy can be performed.

[0099] Further, for the above-shown averaging of a plurality of slots, when a common channel cannot be used for estimation, or when the propagation path fixed transmit part is large, the number of slots for averaging is decreased, or depending on the case, only the present slot is used, averaging by an appropriate averaging slot number can be performed without changing the construction of the receiver and measurement algorithm, whereby high quality communication, reduction of transmit power, and increased channel capacity can be achieved, and complexity of the mobile terminal can be suppressed.

(Effects of embodiment 2)

[0100] With the construction as in the embodiment 2, the same effects as shown in embodiment 1 can be obtained, and averaging of the received signal power is performed by weighting average using the forgetting factor α, buffers such as delayer for storing past received signals can be reduced.

[0101] For example, in embodiment 1, averaging of a plurality of slots is calculated by Formula 1 shown below.

averagedR_n=(R_n+R_{n-1}+R{n-2}+R_{n-3})/4 [FORMULA 1]

[0102] The formula (1) is a formula for averaging using past 4 slots, in which R_n shows a received power value of n'th slot. Further, for simplicity of description, cancel due to variation is not considered.

[0103] While, an ordinary averaging using FIR filter as shown above is performed in embodiment 1, averaging in embodiment 2 is represented by averagedR_n=Rn* +averagedR_{n-1}*(1-) [FORMULA 2]

and exponential weighted averaging (averaging using IIR filter) is performed using the forgetting factor α. For example, when it is assumed as $\alpha = 0.25$, the same averaging effect as averaging of about 4 slots can be obtained. Therefore, by performing such exponential weighted averaging, only one previous value (in the above formula, averaged R_(n-1)) of past received power value may be stored, thereby reducing the calculation amount.

[0104] Further, the propagation path variation estimation value and the transmit power changing amount estimation value are also calculation for immediately 1 slot previous values, and the calculation amount can be reduced.

[0105] Still further, when the effect of the value using received signals of past slots is to be changed, it can be achieved by changing the factor α.

[0106] The present invention has been described in detail with respect to various embodiments, and it will now be apparent from the foregoing to those skilled in the art that changes and modifications may be made without departing from the invention in its broader aspects, and it is the intention, therefore, in the appended claims to cover all such changes and modifications as fall within the true spirit of the invention.

Claims

1. A CDMA reception apparatus characterized by comprising:

   propagation path variation estimation means for estimating a propagation path variation in a present transmit power control section from respective transmit power control sections in the past to obtain a propagation path variation estimation value;
   propagation path variation correction means for correcting at least one of vector, amplitude and/or power of a received signal of said plurality of transmit power control sections with said propagation path variation estimation value obtained by said propagation path variation estimation means; and
   averaging means for averaging at least one of vector, amplitude and/or power of received signal of said plurality of transmit power control sections corrected by said propagation path variation correction means.

2. A CDMA reception apparatus characterized by comprising:

   transmit power changing amount estimation means for estimating a changing amount of transmit power of a communication partner station varied by transmit power control in the present transmit power control section from respective transmit power control sections in the past;
   transmit power changing amount correction means for correcting at least one of vector, amplitude and/or power of a received signal of said plurality of transmit power control sections with said transmit power changing amount estimation value obtained by said transmit power changing amount estimation means; and
   averaging means for averaging at least one of vector, amplitude and/or power of received signal of said plurality of transmit power control sections corrected by said transmit power changing amount correction means.

3. The CDMA reception apparatus as claimed in Claim 1 or 2, characterized in that said averaging means is provided with

   vector addition means for performing vector addition;
   division means for dividing a vector added by said vector addition means with a number of vectors added; and
   means for converting vector divided by said division means into a power.

4. The CDMA reception apparatus as claimed in Claim 1 or 2, characterized in that said averaging means is provided with

   amplitude addition means for performing amplitude addition;
   division means for dividing an amplitude added by said amplitude addition means with a number of amplitudes added; and
   means for converting amplitude divided by said division means into a power.

5. The CDMA reception apparatus as claimed in Claim 1 or 2, characterized in that said averaging means is provided with

   power addition means for performing power addition;

division means for dividing a power added by said power addition means with a number of powers added.

6. The CDMA reception apparatus as claimed in Claim 1, characterized in that said propagation path variation estimation means estimates a propagation path variation using a channel not performing transmit power control.

7. The CDMA reception apparatus as claimed in Claim 2, characterized in that said transmit power changing amount estimation means estimates a transmit power changing amount using a transmit power control indicator transmitted from own station.

8. The CDMA reception apparatus as claimed in Claim 1 or 2, characterized in that said averaging means further comprises averaging section setting means for setting an averaging section.

9. The CDMA reception apparatus as claimed in Claim 8, characterized in that said averaging section setting means comprises:

   means for setting said averaging section to a small section, when performing communication by a channel of which a power allocated to a signal subjected to received signal power measurement existing in each transmit power control section is high; and
   means for setting said averaging section to a large section, when performing communication by a channel of which a power allocated to a signal subjected to received signal power measurement existing in each transmit power control section is small.

10. The CDMA reception apparatus as claimed in Claim 8, characterized in that said averaging section setting means comprises:

   means for setting said averaging section to a large section, when a partner transmit station performs transmit power control, there is a channel other than channel transmitting to said reception station and transmitting a channel not performing transmit power control with the same antenna and directivity, and propagation path variation estimation using said channel not performing transmit power control is possible; and
   means for setting said averaging section to a small section, when a partner transmit station performs transmit power control, there is not a channel other than channel transmitting to said reception station and transmitting a channel not performing transmit power control with the same antenna and directivity, or even when transmitting but not performing transmit power control, and propagation path variation estimation using said channel not performing transmit power control is not possible.

11. The CDMA reception apparatus as claimed in Claim 8, characterized in that said averaging section setting means comprises:

   traveling speed detection means for detecting a relative traveling speed between a communication partner station and own station; and
   means for setting said averaging section to a small section when said detected traveling speed is large, and for setting said averaging section to a large section when said detected traveling speed is small.

12. A received signal power measurement method of a CDMA reception apparatus, characterized by comprising:

   a propagation path variation estimation step for estimating a propagation path variation in a present transmit power control section from respective transmit power control sections in the past to obtain a propagation path variation estimation value;
   a propagation path variation correction step for correcting at least one of vector, amplitude and/or power of a received signal of said plurality of transmit power control sections with said propagation path variation estimation value obtained by said propagation path variation estimation step; and
   an averaging step for averaging at least one of vector, amplitude and/or power of received signal of said plurality of transmit power control sections corrected by said propagation path variation correction step.

13. A received signal power measurement method of a CDMA reception apparatus, characterized by comprising:

   a transmit power changing amount estimation step for estimating a changing amount of transmit power of a communication partner station varied by transmit power control in the present transmit power control section from respective transmit power control sections in the past;

a transmit power changing amount correction step for correcting at least one of vector, amplitude and/or power of a received signal of said plurality of transmit power control sections with said transmit power changing amount estimation value obtained by said transmit power changing amount estimation step; and
an averaging step for averaging at least one of vector, amplitude and/or power of received signal of said plurality of transmit power control sections corrected by said transmit power changing amount correction step.

14. The received signal power measurement method as claimed in Claim 12 or 13, characterized in that said averaging step is provided with

a vector addition step for performing vector addition;
a division step for dividing a vector added by said vector addition step with a number of vectors added; and
a step for converting vector divided by said division step into a power.

15. The received signal power measurement method as claimed in Claim 12 or 13, characterized in that said averaging step is provided with

an amplitude addition step for performing amplitude addition;
a division step for dividing an amplitude added by said amplitude addition step with a number of amplitudes added; and
a step for converting amplitude divided by said division step into a power.

16. The received signal power measurement method as claimed in Claim 12 or 13, characterized in that said averaging step is provided with

a step for performing power addition;
a division step for dividing a power added by said power addition step with a number of powers added.

17. The received signal power measurement method as claimed in Claim 12, characterized in that said propagation path variation estimation step estimates a propagation path variation using a channel not performing transmit power control.

18. The received signal power measurement method as claimed in Claim 13, characterized in that said transmit power changing amount estimation step estimates a transmit power changing amount using a transmit power control indicator transmitted from own station.

19. The received signal power measurement method as claimed in Claim 12 or 13, characterized in that said averaging step further comprises an averaging section setting step for setting an averaging section.

20. The received signal power measurement method as claimed in Claim 19, characterized in that said averaging section setting step comprises:

a step for setting said averaging section to a small section, when performing communication by a channel of which a power allocated to a signal subjected to received signal power measurement existing in each transmit power control section is high; and
a step for setting said averaging section to a large section, when performing communication by a channel of which a power allocated to a signal subjected to received signal power measurement existing in each transmit power control section is small.

21. The received signal power measurement method as claimed in Claim 19, characterized in that said averaging section setting step comprises:

a step for setting said averaging section to a large section, when a partner transmit station performs transmit power control, there is a channel other than channel transmitting to said received station and transmitting a channel not performing transmit power control with the same antenna and directivity, and propagation path variation estimation using said channel not performing transmit power control is possible; and
a step for setting said averaging section to a small section, when a partner transmit station performs transmit power control, there is not a channel other than channel transmitting to said received station and transmitting

a channel not performing transmit power control with the same antenna and directivity, or even when transmitting but not performing transmit power control, and propagation path variation estimation using said channel not performing transmit power control is not possible.

22. The received signal power measurement method as claimed in Claim 19, characterized in that said averaging section setting step comprises:

a step for detecting a relative traveling speed between a communication partner station and own station; and a step for setting said averaging section to a small section when said detected traveling speed is large, and for setting said averaging section to a large section when said detected traveling speed is small.

(54) CDMA reception apparatus and received signal power measuring apparatus in CDMA mobile communication system

(57) In a CDMA reception apparatus, averaging means (412) for averaging at least one of vector, amplitude and power of received signal of a plurality of transmit power control sections is provided. Further, propagation path variation estimation means (407) for estimating a propagation path variation of the present transmit power control section from respective transmit power control sections in the past to obtain a propagation path variation estimation value (408) and propagation path variation correction means (multiplier) for correcting by the propagation path variation estimation value (408) are further provided, wherein the averaging means (412) averages at least one of vector, amplitude and power of received signal of the plurality of transmit power control sections corrected by the propagation path variation correction means (multiplier). With this configuration, the measurement accuracy is improved by measuring received signal power using a plurality of slots including past slots, more accurate transmit power control is performed, thereby achieving improved communication quality, a reduced transmit power, and an increased capacity.

(54) **Outer loop/weighted open loop power control in a time division duplex communication system**

(57) Outer loop/weighted open loop power control controls transmission power levels in a spread spectrum time division duplex communication station. A first communication station (110) transmits a communication to a second communication station including target adjustment information generated at the first station on the basis of measured error rates of communications from the second station to the first station. The second station receives the communication and measures its received power level. Bases on in part the received communication's power level and the communication's transmission power level, a path loss estimate is determined. A quality of the path loss estimate is also determined. The transmission power level for a communication from the second station to the first stations is based on in part weighting the path loss estimate in response to the estimate's quality and based on the receive target adjusted by the target adjustment information transmitted from the first station.

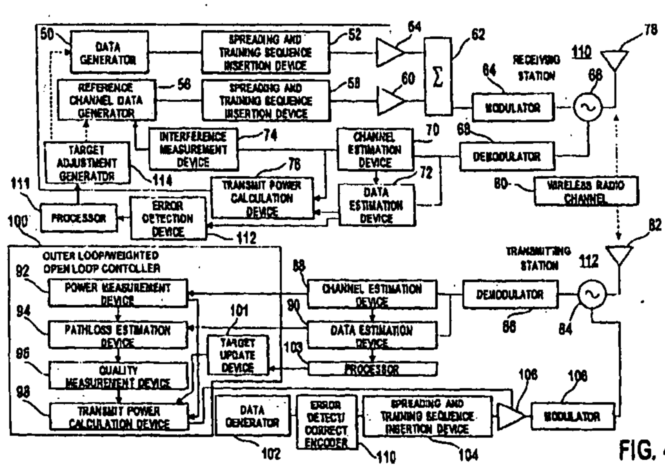

FIG. 4

EP 1 367 740 A1

Description

BACKGROUND

[0001] This invention generally relates to spread spectrum time division duplex (TDD) communication systems. More particularly; the present invention relates to a system and method for controlling transmission power within TDD communication systems.

[0002] **Figure 1** depicts a wireless spread spectrum time division duplex (TDD) communication system. The system has a plurality of base stations **30_1-30_7**.Each base station **30_1** communicates with user equipment (UEs) **32_1-32_3** in its operating area. Communications transmitted from a base station **30_1** to a UE **32_1** are referred to as downlink communications and communications transmitted from a UE **32_1** to a base station **30_1** are referred to as uplink communications.

[0003] In addition to communicating over different frequency spectrums, spread spectrum TDD systems carry multiple communications over the same spectrum. The multiple signals are distinguished by their respective chip code sequences (codes). Also, to more efficiently use the spread spectrum, TDD systems as illustrated in **Figure 2** use repeating frames **34** divided into a number of time slots **36_1-36_n**, such as sixteen time slots. In such systems, a communication is sent in selected time slots **36_1-36_n** using selected codes. Accordingly, one frame **34** is capable of carrying multiple communications distinguished by both time slot and code. The combination of a single code in a single time slot is referred to as a resource unit. Based on the bandwidth required to support a communication, one or multiple resource units are assigned to that communication.

[0004] Most TDD systems adaptively control transmission power levels. In a TDD system, many communications may share the same time slot and spectrum. When a UE **32_1** or base station **30_1** is receiving a specific communication, all the other communications using the same time slot and spectrum cause interference to the specific communication. Increasing the transmission power level of one communication degrades the signal quality of all other communications within that time slot and spectrum. However, reducing the transmission power level too far results in undesirable signal to noise ratios (SNRs) and bit error rates (BERs) at the receivers. To maintain both the signal quality of communications and low transmission power levels, transmission power control is used.

[0005] One approach using transmission power control in a code division multiple access (CDMA) communication system is described in U.S. Patent No. 5,056,109 (Gilhousen et al.). A transmitter sends a communication to a particular receiver. Upon reception, the received signal power is measured. The received signal power is compared to a desired received signal power. Based on the comparison, a control bit is sent to the transmitter either increasing or decreasing transmission power by a fixed amount. Since the receiver sends a control signal to the transmitter to control the transmitter's power level, such power control techniques are commonly referred to as closed loop.

[0006] Under certain conditions, the performance of closed loop systems degrades. For instance, if communications sent between a UE and a base station are in a highly dynamic environment, such as due to the UE moving, such systems may not be able to adapt fast enough to compensate for the changes. The update rate of closed loop power control in TDD is typically 100 cycles per second which is not sufficient for fast fading channels. Accordingly, there is a need for alternate approaches to maintain signal quality and low transmission power levels.

SUMMARY

[0007] Outer loop/weighted open loop power control controls transmission power levels in a spread spectrum time division duplex communication system. At a first communication station, errors are measured in a received communication from a second communication station. Based on in part the measured errors, an adjustment in a target level is determined. The first station transmits a communication and the target adjustment to the second station. The second station measures the first station's communication's received power level. Based on in part the received power level, a path loss is determined. The target level is adjusted in response to receiving the target adjustment. The quality of the path loss is determined with respect to a subsequent communication to be transmitted from the second station. The second station's transmission power level for the subsequent communication is adjusted based on in part the determined path loss, the determined quality and the adjusted target level.

BRIEF DESCRIPTION OF THE DRAWINGS

[0008]

Figure 1 illustrates a prior art TDD system.
Figure 2 illustrates time slots in repeating frames of a TDD system.
Figure 3 is a flow chart of outer loop/weighted open loop power control.
Figure 4 is a diagram of components of two communication stations using outer loop/weighted open loop power

control.

Figure 5 is a graph of the performance of outer loop/weighted open loop, weighted open loop and closed loop power control systems.

Figure 6 is a graph of the three systems performance in terms of Block Error Rate (BLER).

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0009] The preferred embodiments will be described with reference to the drawing figures where like numerals represent like elements throughout. Outer loop/weighted open loop power control will be explained using the flow chart of **Figure 3** and the components of two simplified communication stations **110,112** as shown in **Figure 4.** For the following discussion, the communication station having its transmitter's power controlled is referred to as the transmitting station **112** and the communication station receiving power controlled communications is referred to as the receiving station **110**. Since outer loop/weighted open loop power control may be used for uplink, downlink or both types of communications, the transmitter having its power controlled may be associated with the base station $\mathbf{30_1}$, UE $\mathbf{32_1}$ or both. Accordingly, if both uplink and downlink power control are used, the receiving and transmitting station's components are associated with both the base station $\mathbf{30_1}$ and UE $\mathbf{32_1}$.

[0010] The receiving station **110** receives various radio frequency signals including communications from the transmitting station **112** using an antenna **78**, or alternately, an antenna array, **step 38**. The received signals are passed thorough an isolator **66** to a demodulator **68** to produce a baseband signal. The baseband signal is processed, such as by a channel estimation device **70** and a data estimation device **72**, in the time slots and with the appropriate codes assigned to the transmitting station's communication. The channel estimation device **70** commonly uses the training sequence component in the baseband signal to provide channel information, such as channel impulse responses. The channel information is used by the data estimation device **72**, the interference measurement device **74**, and the transmit power calculation device **76**. The data estimation device **72** recovers data from the channel by estimating soft symbols using the channel information.

[0011] Prior to transmission of the communication from the transmitting station **112**, the data signal of the communication is error encoded using an error detection/correction encoder **110**. The error encoding scheme is typically a circular redundancy code (CRC) followed by a forward error correction encoding, although other types of error encoding schemes may be used.

[0012] Using the soft symbols produced by the data estimation device **72**, an error detection device **112** detects errors in the soft symbols. A processor **111** analyzes the detected error and determines an error rate for the received communication, step 39. Based on the error rate, the processor **111** determines the amount, if any, a target level, such as a target signal to interference ration (SIR_{TARGET}),needs to be changed at the transmitting station **112**, **step 40.** Based on the determined amount, a target adjustment signal is generated by the target adjustment generator **114**. The target adjustment is subsequently sent to the transmitting station, **step 41**. The target adjustment is signaled to the transmitting station **112**, such as using a dedicated or a reference channel as shown in **Figure 4, step 41.**

[0013] One technique to determine the amount of adjustment in the target level uses an upper and lower threshold. If the determined error rate exceeds an upper threshold, the target level is set at an unacceptably low level and needs to be increased. A target level adjustment signal is sent indicating an increase in the target level. If the determined error rate is below a second threshold, the target level is set at an unnecessarily high level and the target level can be decreased. By reducing the target level, the transmitting station's power level is decreased reducing interference to other communications using the same time slot and spectrum. To improve performance, as soon as the error rate exceeds the upper limit, a target adjustment is sent. As a result, high error rates are improved quickly and lower error rates are adjusted slowly, such as once per 10 seconds. If the error rate is between the thresholds, a target adjustment is not sent maintaining the same target level.

[0014] Applying the above technique to a system using CRC and FEC encoding follows. Each CRC block is checked for an error. Each time a frame is determined to have an error, a counter is incremented. As soon as the counter exceeds an upper threshold, such as 1.5 to 2 times the desired block error rate (BLER), a target adjustment is sent increasing the target level. To adjust the SIR_{TARGET} at the transmitting station **112**, the increase in the SIR_{TARGET} is sent (SIR_{INC}), which is typically in a range of 0.25 dB to 4 dB. If the number of CRC frames encountered exceeds a predetermined limit, such as 1000 blocks, the value of the counter is compared to a lower threshold, such as 0.2 to 0.6 times the desired BLER. If the number of counted block errors is below the lower threshold, a target adjustment signal is sent decreasing the target level, SIR_{DEC}. A typical range of SIR_{DEC} is 0.25 to 4 dB. The value of SIR_{DEC}may be based on $SIR_{INC}$and a target block error rate, $BLER_{TARGET}$.The $BLER_{TARGET}$is based on the type of service. A typical range for the $BLER_{TARGET}$is 0.1% to 10%. **Equation 1** illustrates one such approach for determining SIR_{DEC}.

$$SIR_{DEC} = SIR_{INC} \times BLER_{TARGET}/(1 - BLER_{TARGET}) \quad \text{Equation 1}$$

[0015] If the count is between the thresholds for the predetermined block limit, a target adjustment signal is not sent.

[0016] Alternately, a single threshold may be used. If the error rate exceeds the threshold, the target level is increased. If the error rate is below the threshold, the target is decreased. Additionally, the target level adjustment signal may have several adjustment levels, such as from 0 dB to ±4 dB in 0.25 dB increments based on the difference between the determined error rate and the desired error rate.

[0017] The interference measurement device **74** of the receiving station **110** determines the interference level in dB, I_{RS}, within the channel, based on either the channel information, or the soft symbols generated by the data estimation device **72**, or both. Using the soft symbols and channel information, the transmit power calculation device **76** controls the receiving station's transmission power level by controlling the gain of an amplifier **54**.

[0018] For use in estimating the pathloss between the receiving and transmitting stations **110,112** and sending data, the receiving station **110** sends a communication to the transmitting station **112, step 41**. The communication may be sent on any one of the various channels. Typically, in a TDD system, the channels used for estimating pathloss are referred to as reference channels, although other channels may be used. If the receiving station **110** is a base station **30_1**, the communication is preferably sent over a downlink common channel or a common control physical channel (CCPCH). Data to be communicated to the transmitting station **112** over the reference channel is referred to as reference channel data. The reference data may include, as shown, the interference level, I_{RS}, multiplexed with other reference data, such as the transmission power level, T_{RS}. The interference level, I_{RS}, and reference channel power level, I_{RS}, may be sent in other channels, such as a signaling channel.

[0019] The reference channel data is generated by a reference channel data generator **56**. The reference data is assigned one or multiple resource units based on the communication's bandwidth requirements. A spreading and training sequence insertion device **58** spreads the reference channel data and makes the spread reference data time-multiplexed with a training sequence in the appropriate time slots and codes of the assigned resource units. The resulting sequence is referred to as a communication burst. The communication burst is subsequently amplified by an amplifier **60**. The amplified communication burst may be summed by a sum device **62** with any other communication burst created through devices, such as a data generator **50**, spreading and training sequence insertion device **52** and amplifier **54**.

[0020] The summed communication bursts are modulated by a modulator **64**. The modulated signal is passed thorough an isolator **66** and radiated by an antenna **78** as shown or, alternately, through an antenna array. The radiated signal is passed through a wireless radio channel **80** to an antenna **82** of the transmitting station **112**. The type of modulation used for the transmitted communication can be any of those known to those skilled in the art, such as direct phase shift keying (DPSK) or quadrature phase shift keying (QPSK).

[0021] The antenna **82** or, alternately, antenna array of the transmitting station **112** receives various radio frequency signals including the target adjustments. The received signals are passed through an isolator **84** to a demodulator **86** to produce a baseband signal. The baseband signal is processed, such as by a channel estimation device **88** and a data estimation device **90**, in the time slots and with the appropriate codes assigned to the communication burst of the receiving station **110**. The channel estimation device **88** commonly uses the training sequence component in the baseband signal to provide channel information, such as channel impulse responses. The channel information is used by the data estimation device **90** and a power measurement device **92**.

[0022] The power level of the processed communication corresponding to the reference channel, R_{TS}, is measured by the power measurement device **92** and sent to a pathloss estimation device **94, step 42**. Both the channel estimation device **88** and the data estimation device **90** are capable of separating the reference channel from all other channels. If an automatic gain control device or amplifier is used for processing the received signals, the measured power level is adjusted to correct for the gain of these devices at either the power measurement device **92** or pathloss estimation device **94**. The power measurement device is a component of an outer loop/weighted open loop controller **100**. As shown in **Figure 4**, the outer loop/weighted open loop controller **100** comprises the power measurement device **92**, pathloss estimation device **94**, quality measurement device **94**, target update device **101**, and transmit power calculation device **98**.

[0023] To determine the path loss, L, the transmitting station **112** also requires the communication's transmitted power level, T_{RS}. The communication's transmitted power level, T_{RS}, may be sent along with the communication's data or in a signaling channel. If the power level, T_{RS}, is sent along with the communication's data, the data estimation device **90** interprets the power level and sends the interpreted power level to the pathloss estimation device **94**. If the receiving station **110** is a base station **30_1**, preferably the transmitted power level, T_{RS}, is sent via the broadcast channel (BCH) from the base station **30_1**. By subtracting the received communication's power level, R_{TS}, from the sent communication's transmitted power level, T_{RS}, the pathloss estimation device **94** estimates the path loss, L, between the two stations **110,112, step 43**. Additionally, a long term average of the pathloss, L_0, is updated, **step 44.** The long term average of the pathloss, L_0, is an average of the pathloss estimates. In certain situations, instead of transmitting the transmitted power level, T_{RS}, the receiving station **110** may transmit a reference for the transmitted power level. In that case, the pathloss estimation device **94** provides reference levels for the pathloss, L.

[0024] Since TDD systems transmit downlink and uplink communications in the same frequency spectrum, the conditions these communications experience are similar. This phenomenon is referred to as reciprocity. Due to reciprocity, the path loss experienced for the downlink will also be experienced for the uplink and vice versa. By adding the estimated path loss to a target level, a transmission power level for a communication from the transmitting station **112** to the receiving station **110** is determined.

[0025] If a time delay exists between the estimated path loss and the transmitted communication, the path loss experienced by the transmitted communication may differ from the calculated loss. In TDD where communications are sent in differing time slots **36_1-36_n**, the time slot delay between received and transmitted communications may degrade the performance of an open loop power control system. To overcome these drawbacks, weighted open loop power control determines the quality of the estimated path loss using a quality measurement device **96, step 45,** and weights the estimated path loss accordingly, L, and long term average of the pathloss, L_0.

[0026] To enhance performance further in outer loop/weighted open loop, a target level is adjusted. A processor **103** converts the soft symbols produced by the data estimation device **90** to bits and extracts the target adjustment information, such as a SIR_{TARGET} adjustment. A target update device **101** adjusts the target level using the target adjustments, **step 46**. The target level may be a SIR_{TARGET} or a target received power level at the receiving station **110**.

[0027] The transmit power calculation device **98** combines the adjusted target level with the weighted path loss estimate, L, and long term average of the pathloss estimate, L_0, to determine the transmission power level of the transmitting station, **step 47**.

[0028] Data to be transmitted in a communication from the transmitting station **112** is produced by data generator **102.** The data is error detection/correction encoded by error detection/correction encoder **110.** The error encoded data is spread and time-multiplexed with a training sequence by the training sequence insertion device **104** in the appropriate time slots and codes of the assigned resource units producing a communication burst. The spread signal is amplified by an amplifier **106** and modulated by modulator **108** to radio frequency. The gain of the amplifier is controlled by the transmit power calculation device **98** to achieve the determined transmission power level. The power controlled communication burst is passed through the isolator **84** and radiated by the antenna **82**.

[0029] The following is one outer loop/weighted open loop power control algorithm. The transmitting stations's transmission power level in decibels, P_{TS}, is determined using **Equation 2.**

$$P_{TS} = SIR_{TARGET} + I_{RS} + \alpha(L-L_0) + L_0 + \text{CONSTANT VALUE} \qquad \text{Equation 2}$$

[0030] The SIR_{TARGET} has an adjusted value based on the received target adjustment signals. For the downlink, the initial value of SIR_{TARGET} is known at the transmitting station **112.** For uplink power control, SIR_{TARGET} is signaled from the receiving station **110** to the transmitting station **112.** Additionally, a maximum and minimum value for an adjusted SIR_{TARGET} may also be signaled. The adjusted SIR_{TARGET} is limited to the maximum and minimum values. I_{RS} is the measure of the interference power level at the receiving station **110.**

[0031] L is the path loss estimate in decibels, T_{RS} - R_{TS}, for the most recent time slot **36_1-36_n** that the path loss was estimated. L_0, the long term average of the path loss in decibels, is the running average of the pathloss estimate, L. The CONSTANT VALUE is a correction term. The CONSTANT VALUE corrects for differences in the uplink and downlink channels, such as to compensate for differences in uplink and downlink gain. Additionally, the CONSTANT VALUE may provide correction if the transmit power reference level of the receiving station is transmitted, instead of the actual transmit power, T_{RS}. If the receiving station **110** is a base station, the CONSTANT VALUE is preferably sent via a Layer 3 message.

[0032] The weighting value, α, is a measure of the quality of the estimated path loss and is, preferably, based on the number of time slots **36_1-36_n** between the time slot, n, of the last path loss estimate and the first time slot of the communication transmitted by the transmitting station **112.** The value of α is between zero and one. Generally, if the time difference between the time slots is small, the recent path loss estimate will be fairly accurate and α is set at a value close to one. By contrast, if the time difference is large, the path loss estimate may not be accurate and the long term average path loss measurement is most likely a better estimate for the path loss. Accordingly, α is set at a value closer to one.

[0033] **Equations 3** and **4** are equations for determining α.

$$\alpha = 1 - (D - 1)/(D_{max} - 1) \qquad \text{Equation 3}$$

$$\alpha = \max\{1 - (D-1)/(D_{max\text{-}allowed} - 1), 0\} \qquad \text{Equation 4}$$

The value, D, is the number of time slots **36_1-36_n** between the time slot of the last path loss estimate and the first time slot of the transmitted communication which will be referred to as the time slot delay. If the delay is one time slot, α is one. D_{max} is the maximum possible delay. A typical value for a frame having fifteen time slots is seven. If the delay is D_{max}, α is zero $D_{max\text{-}allowed}$ is the maximum allowed time slot delay for using open loop power control. If the delay exceeds $D_{max\text{-}allowed}$, open loop power control is effectively turned off by setting $\alpha = 0$. Using the transmit power level, P_{TS}, determined by a transmit power calculation device **98** the transmit power of the transmitted communication is set.

[0034] **Figures 5** and **6** compare the performance of the weighted outer loop/open loop, open loop and closed loop systems. The simulations in **Figures 5** and **6** were performed for a slightly different version of the outer loop/weighted open loop algorithm. In this version, the target SIR is updated every block. A SIR_{TARGET} is increased if a block error was detected and decreased if no block error was detected. The outer loop/weighted open loop system used **Equation 2. Equation 3** was used to calculate α. The simulations compared the performance of the systems controlling a UE's **32_1** transmission power level. For the simulations, 16 CRC bits were padded every block. In the simulation, each block was 4 frames. A block error was declared when at least two raw bit errors occur over a block. The uplink communication channel is assigned one time slot per frame. The target for the block error rate is 10%. The SIR_{TARGET} is updated every 4 frames. The simulations address the performance of these systems for a UE **32_1** traveling at 30 kilometers per hour. The simulated base station used two antenna diversity for reception with each antenna having a three finger RAKE receiver. The simulation approximated a realistic channel and SIR estimation based on a midamble sequence of burst type 1 field in the presence of additive white Gaussian noise (AWGN). The simulation used an International Telecommunication Union (ITU) Pedestrian B type channel and QPSK modulation. Interference levels were assumed to have no uncertainty. Channel coding schemes were not considered. L_0 was set at 0 db.

[0035] Graph **120** of **Figure 5** shows the performance as expected in terms of the required E_S/N_O for a BLER of 10^{-1} as a function of time delay between the uplink time slot and the most recent downlink time slot. The delay is expressed by the number of time slots. E_s is the energy of the complex symbol. **Figure 5** demonstrates that, when gain/interference uncertainties are ignored, the performance of the combined system is almost identical to that of weighted open loop system. The combined system outperforms the closed loop system for all delays.

[0036] In the presence of gain and interference uncertainties, the transmitted power level of the open loop system is either too high or too low of the nominal value. In graph **122** of **Figure 6**, a gain uncertainty of -2 dB was used. **Figure 6** shows the BLER as a function of the delay. The initial reference SIR_{TARGET} for each system was set to its corresponding nominal value obtained from **Figure 5,** in order to achieve a BLER of 10^{-1}. **Figure 6** shows that, in the presence of gain uncertainty, both the combined and closed loop systems achieve the desired BLER. The performance of the weighted open loop system severely degrades.

Claims

1. A spread spectrum time division duplex user equipment communicating using frames with time slots for communication, comprising:

   means (82, 88, 92) for receiving, in a first time slot, a first communication having a transmit power level and measuring a power level of said communication;
   means (94) for determining a path loss estimate based in part on said measured power level and said received power level; the user equipment

   characterized by:

   means (96, 98 106) for setting a transmission power level for transmission of a second communication in a second time slot based in part on the path loss estimate weighted by a first factor and a long term path loss estimate weighted by a second factor, said first and second factors being a function of a time separation of the first and second time slots; and
   means (108, 82) for transmitting the second communication in the second time slot at the set transmission power level.

2. The user equipment of claim 1 further **characterized by** comprising:

means (98) for determining the long term path loss estimate based at least in part upon an average of path loss estimates of communications received by the user equipment.

3. The user equipment of claim 2 further **characterized by** comprising:

means (96) for determining a quality, α, of the path loss estimate which is based in part on a number of slots, D, between the first and second time slot; and

wherein the first factor is $\alpha$and teh second factor is 1-α.

4. The user equipment of claim 3 further **characterized by** a maximum time slot delay is D_{max} and $\alpha$is determined by:

$$\alpha = 1 - (D - 1)/(D_{max} - 1).$$

5. The user equipment of claim 3 further **characterized by** maximum allowed time slot delay is $D_{max\text{-}allowed}$and the determined quality, α, is determined by:

$$\alpha = \max\{1-(D-1)/(D_{max\text{-}allowed}-1), 0\}.$$

6. A spread spectrum time division duplex user equipment using frames with time slots for communication, comprising:

an antenna (82) for receiving a first communication in a first time slot and transmitting an amplified second communication in a second time slot;
a channel estimation device (88) having an input receiving said first communication for producing channel information;
a data estimation device (90) responsive to said first communication and said channel information for producing interpreted data;
a power measurement device (92) responsive to said channel information for determining a received power level of the first communication;
a path loss estimation device (94) responsive to said measured power level for producing a path loss estimate of the first communication; the user equipment

characterized by comprising:

a quality measurement device (96) for producing a quality measurement based at least in part upon a time separation of the first time slot and a second time slot;
a transmit power calculation device (98) responsive to said path loss estimate and said quality measurement for producing a power control signal based at least in part upon said path loss estimate weighted by a first factor and a long term path loss estimate weighted by a second factor, wherein the first and second factors are based in part on the quality measurement; and
an amplifier (106) receiving the power control signal and a second communication to be transmitted in the second time slot for amplifying the second communication responsive to the power control signal to produce the amplified second communication for transmission by the antenna.

7. The user equipment of claim 6 further comprising:

a data generator (102) for producing communication data;
a spreading and training sequence insertion device (104) having an input receiving the communication data for producing the second communication in the second time slot; and
a modulator (108) having an input receiving the amplified second communication for modulating the amplified second communication to radio frequency prior to transmission.

8. The user equipment of claim 6 further comprising:

a demodulator (86) having an input receiving the received first communication for producing a baseband signal; and

wherein the channel estimation device (88) and the data estimation device (90) each have an input receiving the baseband signal.

9. The user equipment of claim 6 further **characterized by** the quality measurement is in the range of zero to one and the first factor is the quality measurement and the second factor is one minus the quality measurement.

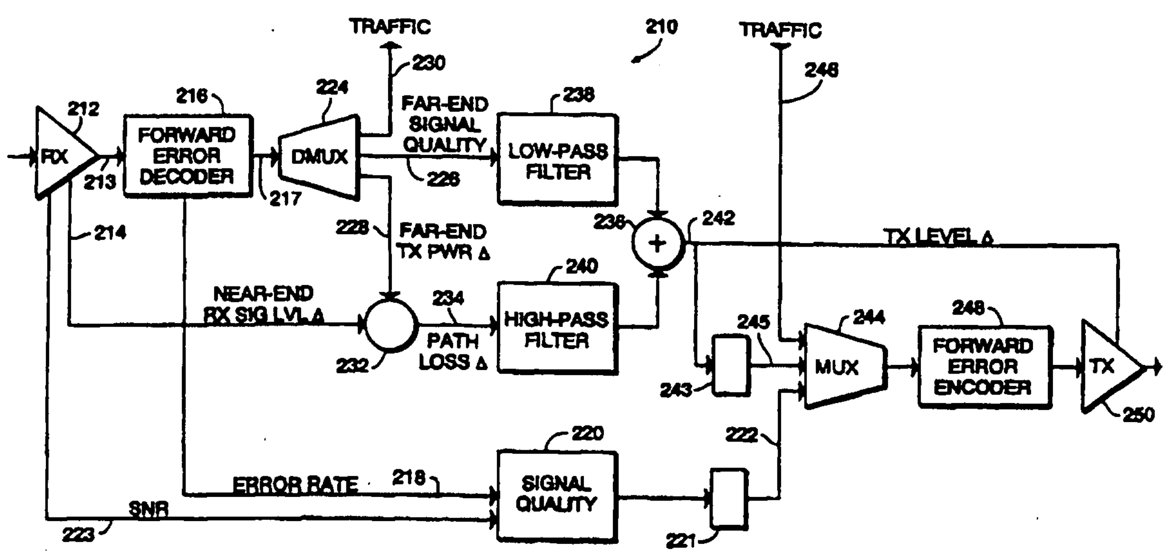
(54) Title: CELLULAR COMMUNICATIONS POWER CONTROL SYSTEM



(57) Abstract

Two-way adaptive power control and signal quality monitoring and power control responsive thereto are provided for controlling the power output levels of transmitters (210) to the minimum necessary for satisfactory communications. Each transmission includes a code representative of the transmitter output power level. Receivers (212) compare this code to the received signal strength and ajust their associated transmitter power output level accordingly. Bit error rate (218) and SNR (223) are monitored by receivers to develop a measure of signal quality (220). A signal quality code is transmitted (250) to remote units and transmission output power level is adjusted in response.

CELLULAR COMMUNICATIONS POWER CONTROL SYSTEM

BACKGROUND

The invention relates to communication systems and in particular, to a cellular mobile communications system having integrated satellite and ground nodes.

The cellular communications industry has grown at a fast pace in the United States and even faster in some other countries. It has become an important service of substantial utility and because of the growth rate, saturation of the existing service is of concern. High density regions having high use rates, such as Los Angeles, New York and Chicago are of most immediate concern. Contributing to this concern is the congestion of the electromagnetic frequency spectrum which is becoming increasingly severe as the communication needs of society expand. This congestion is caused not only by cellular communications systems but also by other communications systems. However, in the cellular communications industry alone, it is estimated that the number of mobile subscribers will increase on a world-wide level by an order of magnitude within the next ten years. The radio frequency spectrum is limited and in view of this increasing demand for its use, means to more efficiently use it are continually being explored.

Existing cellular radio is primarily aimed at providing mobile telephone service to automotive users in developed metropolitan areas. For remote area users, airborne users, and marine users, AIRFONE and INMARSAT services exist but coverage is incomplete and service is relatively expensive. Mobile radio satellite systems in an advanced planning stage will probably provide improved direct-broadcast voice channels to mobile subscribers in remote areas but still at significantly higher cost in comparison to existing ground cellular service. The ground cellular and planned satellite technologies complement one another in geographical coverage in that the ground cellular communications service provides voice telephone service in relatively developed urban and suburban areas but not in sparsely populated areas, while the planned earth orbiting satellites will serve the sparsely populated areas.

Cellular communications systems divide the service areas into geographical cells, each served by a base station or node typically located at its center. The central node transmits sufficient power to cover its cell area with adequate field strength. If a mobile user moves to a new cell, the radio link is switched to the new node provided there is an available channel. Present land mobile communication systems typically use a frequency modulation (FM) approach and because of the limited interference rejection capabilities of FM modulation, each radio channel may be used only once over a wide geographical area encompassing many cells. This means that each cell can use only a small fraction of the total allocated radio frequency band, resulting in an inefficient use of the available spectrum. In some cases, the quality of speech is poor because of the phenomena affecting FM transmission known as fading and "dead spots." The subjective effect of fading is repeated submersion of the voice signal in background noise frequently many times per second if the mobile unit is in motion. The problem is exacerbated by interference from co-channel users in distant cells and resultant crosstalk due to the limited interference rejection capability of FM. Additionally, communications privacy is relatively poor; the FM signal may be heard by others who are receiving that frequency.

In the case where one band of frequencies is preferable over others and that one band alone is to be used for mobile communications, efficient communications systems are necessary to assure that the number of users desiring to use the band can be accommodated. For example, there is presently widespread agreement on the choice of L-band as the technically preferred frequency band for the satellite-to-mobile link in mobile communications systems. In the case where this single band is chosen to contain all mobile communications users, improvements in spectral utilization in the area of interference protection and in the ability to function without imposing intolerable interference on other services will be of paramount importance in the considerations of optimal use of the scarce spectrum.

Troubling both terrestrial and satellite communication is channel fading, in which communications channel experiences fading due to numerous factors such as changes in weather conditions, signal propagation, local terrain etc..

Satellite transceivers are generally located in geosynchronous earth orbit, approximately 22,300 miles from earth, and as such, are approximately the same distance from mobile units. Accordingly, path loss in the satellite channel is relatively minor, on the order of only a few dB. Unfortunately, satellite transmissions still experience substantial fading due to the direct component of the satellite signal being summed with multiply reflected components of the satellite signal, thereby inducing channel fading of several dB.

In contrast to satellite transmission, the terrestrial to mobile transmission is substantially effected by the distance between the mobile unit and the cell site. For example, one mobile unit may be located at a distance many miles from the cell site, while another may be only yards away. Accordingly, path loss variations of terrestrial transmissions may be orders of magnitude greater than experienced by satellite transmissions. Further, the terrestrial transmissions typically experience substantial fading due to the signal being reflected from many different features of the physical environment. As a result, a signal may arrive at a mobile unit from many different directions causing both constructive and destructive summation of the signals. Additionally, the transmitted signal may be partially obstructed by buildings, foliage, and the like to produce additional signal fading.

In order to overcome these constraints, the transceivers of typical communications systems commonly radiates at a power level which is 30 to 40 dB greater than is required on the average in order to overcome fading nulls. This results in greatly increased inter-system interference, reduced battery life and a reduction of potential users in the communications system.

The severely limited commodity in the satellite links is satellite prime power, a major component of the weight of a communication satellite and thereby a major factor in satellite cost. Generally in systems such as this, the down links to individual users are the largest power consumers and thus for a limited satellite source power, may provide the limiting factor on the number of users that can be served. Thus it is important to design the system for minimum required power per user.

It would be desirable to provide a power control system to compensate for fading and interference without exceeding the minimum amount of power necessary to overcome such interference. To this end, numerous designs have been developed in an attempt to control transmitter power. A transmitter power control system is disclosed in the patent to Wheatley, III, U.S. Patent No. 5,267,262. Wheatley, III discloses the cell site measuring the signal strength and signal quality, i.e. bit error rate, of a signal transmitted by the mobile unit. The cell site processes the signal strength and signal quality to determine the desired signal strength for that mobile unit and transmits a power adjustment command back to the mobile unit. This power adjustment command is combined with the mobile unit's one way estimate of received signal strength to obtain a final value of the mobile unit transmitter power.

Unfortunately, Wheatley discloses telemetering the transmit power only as a static parameter at call setup time, not for the purpose, nor at a sample rate sufficient to support dynamic compensation of the received signal strength for adaptive power variations in a two-way adaptive power control system where both transmitters continuously adapt their respective transmit power.

A similar concept to control transmitter power is disclosed in Wilson, et al., U.S. Patent No. 5,293,639. Wilson et al. discloses the control of the output power level of a transmitted signal by the mobile unit transmitting a first message on a first communications channel to a repeater station. The repeater station measures the quality of the received first message to produce a quality metric representative of the quality of the first message. The repeater station retransmits the first message back to the mobile unit, appending the quality metric for determination by the mobile unit of its output power. Unfortunately, the retransmission of the first message is unnecessary in many system applications thus requiring additional power, and causing unnecessary signal interference.

It is therefore an object of the present invention to provide an improved method and apparatus for controlling the transmitter power of a transceiver of a cellular communications system including an adaptive two-way power control system which continuously maintains each transmitted signal power at a minimum necessary level, adapting rapidly to, and accommodating signal fade dynamically and only as necessary.

SUMMARY OF THE INVENTION

Briefly and in general terms, the invention, is directed to a cellular communications system having an adaptive transmitter power control system and method compensate for received signal strength variations, such as those caused by buildings, foliage and other obstructions. Each receiver determines the quality of the received signal and provides a local quality signal to its associated transmitter in the respective transceiver indicative of that received signal quality. Each transmitter also transmits the local quality signal provided to it from its associated receiver and the transceiver is additionally responsive to the quality signal received from the other transceiver with which it is in communication to control its own output power in the response to that quality signal.

In yet a further aspect, a path loss measure is derived from the received signal strength and from data included in each transmitted signal which indicates that transmitter's output power level. Based on the derived path loss and the transmitter's power level data, the receiver can then adjust the power output of its own associated transmitter accordingly.

In a more detailed aspect, the error rate of the received signal is determined in providing the quality signal, and in another aspect, the signal-to-noise ratio (SNR) is measured to determine quality. The transceiver receiving the error rate signal or the SNR from the other transceiver controls its own transmitter power output in response.

Other aspects and advantages of the invention will become apparent from the following detailed description and the accompanying drawings, illustrating by way of example the features of the invention.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a block diagram showing an overview of the principal elements of a communications system in accordance with the principles of the invention;

FIG. 2 is a diagram of the frequency sub-bands of the frequency band allocation for a cellular system;

FIG. 3 is a overview block diagram of a communications system in accordance with the principles of the invention without a network control center;

FIG. 4 is a diagram showing the interrelationship of the cellular hierarchical structure of the ground and satellite nodes in a typical section and presents a cluster comprising more than one satellite cell;

FIG. 5 is a block diagram of a satellite link system showing the user unit and satellite node control center;

FIG. 6 is a block diagram of one embodiment of satellite signal processing in the system of FIG. 5;

FIG. 7 is a functional block diagram of a user transceiver showing an adaptive power control system;

FIGS. 8a through 8h show timing diagrams of an adaptive, two-way power control system; and

FIG 9 is a functional diagram of a two-way power control system incorporating telemetered signal-quality deficiency supervisory control.

FIG 10 is a functional diagram of a power control system combining adaptive signal quality power control and adaptive path loss power control.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

As is shown in the exemplary drawings, the invention, though not limited to, is preferredly embodied in a cellular communications system utilizing integrated satellite and ground nodes both of which use the same modulation, coding, and both responding to an identical user unit.

Referring now to FIG. 1, an overview of a preferred communications system 10 is presented showing the functional inter-relationships of the major elements. The system network control center 12 directs the top level allocation of calls to satellite and ground regional resources throughout the system. It also is used to coordinate system-wide operations, to keep track of user locations, to perform optimum allocation of system resources to each call, dispatch facility command codes, and monitor and supervise overall system health. The regional node control centers 14, one of which is shown, are connected to the system network control center 12 and direct the allocation of calls to ground nodes within a major metropolitan region. The regional node control center 14 provides access to and from fixed land communication lines, such as commercial telephone systems known as the public switched telephone network (PSTN). The ground nodes 16 under direction of the respective regional node control center 14 receive calls over the fixed land line network encode them, spread them according to the unique spreading code assigned to each designated user, combine them into a composite signal, modulate that composite signal onto the transmission carrier, and broadcast them over the cellular region covered.

Satellite node control centers 18 are also connected to the system network control center 12 via status and control land lines and similarly handle calls designated for satellite links such as from PSTN, encode them, and multiplex them with other similarly directed calls into an uplink trunk, which is beamed up to the designated satellite 20. Satellite nodes 20 receive the uplink trunks, frequency demultiplex the calls intended for different satellite cells, frequency translate and direct each to its appropriate cell transmitter and cell beam, and broadcast the composite of all such similarly directed calls down to the intended satellite cellular area. As used herein, "backhaul" means the link between a satellite 20 and a satellite node control center 18. In one embodiment, it is a K-band frequency while the link between the satellite 20 and the user unit 22 uses an L-band or an S-band frequency.

As used herein, a "node" is a communication site or a communication relay site capable of direct one- or two-way radio communication with users. Nodes may include moving or stationary surface sites or airborne or satellite sites.

User units 22 respond to signals of either satellite or ground node origin, receive the outbound composite signal, de-modulate, and decode the information and deliver the call to the user. Such user units 22 may be mobile or may be fixed in position. Gateways 24 provide direct trunks, that is, groups of channels, between satellite and the ground public switched telephone system or private trunk users. For example, a gateway may comprise a dedicated satellite terminal for use by a large company or other entity. In the embodiment of FIG. 1, the gateway 24 is also connected to that system network controller 12.

All of the above-discussed centers, nodes, units and gateways are full duplex transmit/receive performing the corresponding inbound (user to system) link functions as well in the inverse manner to the outbound (system to user) link functions just described.

Referring now to FIG. 2, the allocated frequency band 26 of a communications system is shown. The allocated frequency band 26 is divided into 2 main sub-bands, an outgoing sub-band 25 and an incoming sub-band 27. Additionally the main sub-bands are themselves divided into further sub-bands which are designated as follows:

OG: Outbound Ground 28 (ground node to user)

OS: Outbound Satellite 30 (satellite node to user)

OC: Outbound Calling and Command 32 (node to user)

IG: Inbound Ground 34 (user to ground node)

IS: Inbound Satellite 36 (user to satellite node)

IC: Inbound Calling and Tracking 38 (user to node)

All users in all cells use the entire designated sub-band for the described function. Unlike existing ground or satellite mobile systems, there is no necessity for frequency division by cells; all cells may use these same basic six sub-bands. This arrangement results in a higher frequency reuse factor as is discussed in more detail below.

In one embodiment of the communication system, a mobile user's unit 22 will send an occasional burst of an identification signal in the IC sub-band either in response to a poll or autonomously. This may occur when the unit 22 is in standby mode. This identification signal is tracked by the regional node control center 14 as long as the unit is within that respective region, otherwise the signal will be tracked by the satellite node or nodes. In another embodiment, this identification signal is tracked by all ground and satellite nodes capable of receiving it. This information is forwarded to the network control center 12 via status and command lines. By this means, the applicable regional node control center 14 and the system network control center 12 remain constantly aware of the cellular location and link options for each active user 22. An intra-regional call to or from a mobile user 22 will generally be handled solely by the respective regional node control center 14. Inter-regional calls are assigned to satellite or ground regional system resources by the system network control center 12 based on the location of the parties to the call, signal quality on the various link options, resource availability and best utilization of resources.

A user 22 in standby mode constantly monitors the common outbound calling frequency sub-band OC 32 for calling signals addressed to him by means of his unique spreading code. Such calls may be originated from either ground or satellite nodes. Recognition of his unique call code initiates the user unit 22 ring function. When the user goes "off-hook", e.g. by lifting the handset from its cradle, a return signal is broadcast from the user unit 22 to any receiving node in the user calling frequency sub-band IC 38. This initiates a handshaking sequence between the calling node and the user unit which instructs the user unit whether to transition to either satellite, or ground frequency sub-bands, OS 30 and IS 36 or OG 28 and IG 34.

A mobile user wishing to place a call simply takes his unit 22 off hook and dials the number of the desired party, confirms the number and "sends" the call. Thereby an incoming call sequence is initiated in the IC sub-band 38. This call is generally heard by several ground and satellite nodes which forward call and signal quality reports to the appropriate system network control center 12 which in turn designates the call handling to a particular satellite node 20 or regional node control center 14. The call handling element then initiates a handshaking function with the calling unit over the OC 32 and IC 38 sub-bands, leading finally to transition to the appropriate satellite or ground sub-bands for communication.

Referring now to FIG. 3, a block diagram of a communications system 40 which does not include a system network control center is presented. In this system, the satellite node control centers 42 are connected directly into the land line network as are also the regional node control centers 44. Gateway systems 46 are also available as in the system of FIG. 1. and connect the satellite communications to the appropriate land line or other communications systems. The user unit 22 designates satellite node 48 communication or ground node 50 communication by sending a predetermined code.

Referring now to FIG. 4, a hierarchical cellular structure is shown. A pair of clusters 52 of ground cells 54 are shown. Additionally, a plurality of satellite cells 56 are shown. Although numerals 54 and 56 point only to two cells each, this has been done to retain clarity in the drawing. Numeral 54 is meant to indicate all ground cells in the figure and similarly numeral 56 is meant to indicate all satellite cells. The cells are shown as hexagonal in shape, however, this is exemplary only. The ground cells may be from 3 to 15 km across although other sizes are possible depending on user density in the cell. The satellite cells may be approximately 200-500 km across as an example depending on the number of beams used to cover a given area. As shown, some satellite cells may include no ground cells. Such cells may cover undeveloped areas for which ground nodes are not practical. Part of a satellite cluster 58 is also shown. The cell members of such a cluster share a common satellite node control center 60.

Referring again to FIG. 1 as well as to FIG. 4, the satellite nodes 20 make use of large, multiple-feed antennas 62 which in one embodiment provide separate, relatively narrow beamwidth beams and associated separate transmitters for each satellite cell 56. For example, the multiple feed antenna 62 may cover an area such as the United States with, typically, about 100 satellite beams/cells and in one embodiment, with about 200 beams/cells. As used herein, "relatively narrow beamwidth" refers to a beamwidth that results in a cell of 500 km or less across. The combined satellite/ground nodes system provides a hierarchical geographical cellular structure. Thus within a dense metropolitan area, each satellite cell 56 may further contain as many as 100 or more ground cells 54, which ground cells would normally carry the bulk of the traffic originated therein. The number of users of the ground nodes 16 is anticipated to exceed the number of users of the satellite nodes 20 where ground cells exist within satellite cells. Because all of these ground node users would otherwise interfere as background noise with the intended user-satellite links, in one embodiment the frequency band allocation may be separated into separate segments for the ground element and the space element as has been discussed in connection with FIG 2. This combined, hybrid service can be provided in a manner that is smoothly transparent to the user. Calls will be allocated among all available ground and satellite resources in the most efficient manner by the system network control center 12.

An important parameter in most considerations of cellular radio communications systems is the "cluster", defined as the minimal set of cells such that mutual interference between cells reusing a given frequency sub-band is tolerable provided that such "co-channel cells" are in different clusters. Conversely all cells within a cluster must use different frequency sub-bands. The number of cells in such a cluster is called the "cluster size". It will be seen that the "frequency reuse factor", i.e. the number of possible reuses of a frequency sub-band within the system is thus equal to the number of cells in the system divided by the cluster size. The total number of channels that can be supported per cell, and therefore overall bandwidth efficiency of the system is thus inversely proportional to the cluster size.

Referring now to FIG. 5, a block diagram is shown of a typical user unit 22 to satellite 20 to satellite node control 18 communication and the processing involved in the user unit 22 and the satellite node control 18. In placing a call for example, the handset 64 is lifted and the telephone number entered by the user. After confirming a display of the number dialed, the user pushes a "send" button, thus initiating a call request signal. This signal is processed through the transmitter processing circuitry 66 which includes spreading the signal using a calling spread code. The signal is radiated by the omni-directional antenna 68 and received by the satellite 20 through its narrow beamwidth antenna 62. The satellite processes the received signal as will be described below and sends the backhaul to the satellite node control center 18 by way of its backhaul antenna 70. On receive, the antenna 68 of the user unit 22 receives the signal and the receiver processor 72 processes the signal. Processing by the user unit 22 will be described in more detail below in reference to FIG. 7.

The satellite node control center 18 receives the signal at its antenna 71, applies it to a circulator 73, amplifies 74, frequency demultiplexes 76 the signal separating off the composite signal which includes the signal from the user shown in FIG. 5, splits it 78 off to one of a bank of code correlators, each of which comprises a mixer 80 for removing the spreading and identification codes, an AGC amplifier 82, the FECC demodulator 84, a demultiplexer 86 and finally a voice encoder/decoder (CODEC) 88 for converting digital voice information into an analog voice signal. The voice signal is then routed to the appropriate land line, such as a commercial telephone system. Transmission by the satellite node control center 18 is essentially the reverse of the above described reception operation.

Referring now to FIG. 6, the satellite transponder 90 of FIG. 5 is shown in block diagram form. A circulator/diplexer 92 receives the uplink signal and applies it to an L-band or S-band amplifier 94 as appropriate. The signals from all the M satellite cells within a "cluster" are frequency multiplexed 96 into a single composite K-band backhaul signal occupying M times the bandwidth of an individual L-/S-band mobile link channel. The composite signal is then split 98 into N parts, separately amplified 100, and beamed through a second circulator 102 to N separate satellite ground cells. This general configuration supports a number of particular configurations various of which may be best adapted to one or another situation depending on system optimization which for example may include considerations related to regional land line long distance rate structure, frequency allocation and subscriber population. Thus, for a low density rural area, one may utilize an M-to-1 ($M>1$, $N=1$) cluster configuration of M contiguous cells served by a single common satellite ground node with M limited by available bandwidth. In order to provide high-value, long distance service between metropolitan areas, already or best covered for local calling by ground cellular technology, an M-to-M configuration would provide an "inter-metropolitan bus" which would tie together all occupants of such M satellite cells as if in a single local calling region. To illustrate, the same cells (for example, Seattle, Los

Angeles, Omaha and others) comprising the cluster of M user cells on the left side of FIG. 6, are each served by corresponding backhaul beams on the right side of FIG. 6.

Referring now to FIG. 7, a functional block diagram of a typical user unit 22 is shown. The user unit 22 comprises a small, light-weight, low-cost, mobile transceiver handset with a small, non-directional antenna 68. The single antenna 68 provides both transmit and receive functions by the use of a circulator/diplexer 104 or other means. It is fully portable and whether stationary or in motion, permits access to a wide range of communication services from one telephone with one call number. It is anticipated that user units will transmit and receive on frequencies in the 1-3 GHz band but can operate in other bands as well.

The user unit 22 shown in FIG. 7 comprises a transmitter section 106 and a receiver section 108. For the transmission of voice communication, a microphone couples the voice signal to a voice encoder 110 which performs analog to digital encoding using one of the various modern speech coding technologies well known to those skilled in the art. The digital voice signal is combined with local status data, and/or other data, facsimile, or video data forming a composite bit stream in digital multiplexer 112. The resulting digital bit stream proceeds sequentially through forward error encoder 114, symbol or bit interleaver 116, symbol or bit, phase, and/or amplitude modulator 118, narrow band IF amplifier 120, wideband multiplier or spreader

122, wide band IF amplifier 124, wide band mixer 126, and final power amplifier 128. Oscillators or equivalent synthesizers derive the bit or baud frequency 130, pseudo-random noise or "chip" frequency 132, and carrier frequency 134. The PRN generator 136 comprises deterministic logic generating a pseudo-random digital bit stream capable of being replicated at the remote receiver. The ring generator 138 on command generates a short pseudo-random sequence functionally equivalent to a "ring.".

The transceiver receive function 108 demodulation operations mirror the corresponding transmit modulation functions in the transmitter section 106. The signal is received by the non-directional antenna 68 and conducted to the circulator 104. An amplifier 142 amplifies the received signal for mixing to an IF at mixer 144. The IF signal is amplified 146 and multiplied or despread 148 and then IF amplified 150 again. The IF signal then is conducted to a bit or symbol detector 152 which decides the polarity or value of each channel bit or symbol, a bit or symbol de-interleaver 154 and then to a forward error decoder 156. the composite bit stream from the FEC decoder 156 is then split into its several voice, data, and command components in the de-multiplexer 158. Finally a voice decoder 160 performs digital to analog converting and results in a voice signal for communication to the user by a speaker or other means. Local oscillator 162 provides the first mixer 144 LO and the bit or symbol detector 152 timing. A PRN oscillator 164 and PRN generator 166 provide the deterministic logic of the spread signal for despreading purposes.

The baud or bit clock oscillator 168 drives the bit in the bit detector 152, forward error decoder 156 and the voice decoder 160.

The bit or symbol interleaver 116 and de-interleaver 154 provide a type of coded time diversity reception which provides an effective power gain against multipath fading to be expected for mobile users. Its function is to spread or diffuse the effect of short bursts of channel bit or symbol errors so that they can more readily be corrected by the error correction code.

As an alternative mode of operation, provision is made for direct data or facsimile or other digital data input 170 to the transmitter chain and output 172 from the receiver chain.

A command decoder 174 and command logic element 176 are coupled to the forward error decoder 156 for receiving commands or information. By means of special coding techniques known to those skilled in the art, the non-voice signal output at the forward error decoder 156 may be ignored by the voice decoder 160 but used by the command decoder 174. An example of the special coding techniques are illustrated in FIG. 7 by the MUX 112 and DEMUX 158.

As shown, acquisition, control and tracking circuitry 178 are provided in the receiver section 108 for the three receive side functional oscillators 162, 164, 168 to acquire and track the phase of their counterpart oscillators in the received signal. Means for so doing are well known to those skilled in the art.

The automatic gain control (AGC) voltage 184 derived from the received signal is used in the conventional way to control the gain of the preceding amplifiers to an optimum value and in addition as an indicator of short term variations of path loss suffered by the received signal. By means to be described more in detail below, this information is combined with simultaneously received digital data 186 in a power level controller 188 indicating the level at which the received signal was originally transmitted to command the local instantaneous transmit power level to a value such that the received value at the satellite node control is approximately constant, independent of fading and shadowing effects. The level commanded to the output power amplifier 128 is also provided 190 to the transmitter multiplexer 112 for transmission to the corresponding unit.

In mobile and other radio applications, fading, shadowing, and interference phenomena result in occasional, potentially significant steep increases of path loss and if severe enough, may result in data loss. In order to insure that the probability that such a fade will be disruptive is acceptably low, conventional design practice is to provide a substantial excess power margin by transmitting at a power level that is normally as much as 10 to 40 dB above the average requirement. But this causes correspondingly increased battery usage, inter-system, and intra-system interference. In a CDMA application, this can drastically reduce the useful circuit capacity of the channel.

In accordance with the principles of the invention is an adaptive two-way power control system which continually maintains each transmitted signal power at a minimum necessary level, adapting rapidly to and accommodating such fades dynamically, and only as necessary. In controlling the transmitted signal power, the adaptive power control system at each end, near-end and far-end, includes a unique hybrid combination of two complementary sensors, the first being a near-end signal strength measure and the second being a far-end signal quality measure, both in operation simultaneously and symmetrically, with respect to each end of the subject two-way communication link.

The signal strength measure is inferred from the near-end measure of received signal strength. In the subject invention, both ends of the link are under adaptive power control depending at least in part on local received signal strength measurement. Thus, the local received strength depends not only on the path loss but also on the instantaneous adapted power level at which the received signal was transmitted from the far end. In order to implement two-way adaptive control, the far-end transmitter continuously telemeters the adapted power at which it is transmitting, multiplexed by any of several available means signal information. Combining the locally measured received signal strength with far end telemetered transmit power level, the transceiver is able to determine the path loss or changes in the path loss of the received signal. Assuming path reciprocity, this provides a first estimate of the path loss of the outgoing path, and in turn, a first estimate of the power or change in power needed by the local transmitter. This determination is fast, in that it responds almost instantaneously to path loss.

Further, the adaptive power control system in accordance with the invention comprises two main adaptive systems, the first being an adaptive signal quality power control system and the second being an adaptive path loss power control system. Each of these systems may be operated independently, but in a preferred embodiment are a combination of the adaptive signal quality power control system and the adaptive path loss power control system.

The adaptive power control system in accordance with the invention considers not only path loss but also a measure of data loss or "signal quality" reported to it from another unit with which it is in communication. Discussing now an embodiment of the adaptive signal quality system, as used herein, "signal quality" refers to the accuracy or fidelity of a received signal in representing the quantity or waveform it is supposed to represent. In a digital data system, this may be measured or expressed in terms of a bit error rate, or, if variable, the likelihood of exceeding a specified maximum bit error rate threshold. Signal quality involves more than just signal strength, depending also on noise and interference level, and on the variability of signal loss over time. Additionally, "grade of service" as used herein is a collective term including the concepts of fidelity, accuracy, fraction of time that communications are satisfactory, etc., any of which may be used to describe the quality objectives or specifications for a communication service. Examples of grade of service objectives would include:

- bit error rate less than one in 10^3;
- ninety percent or better score on the voice diagnostic rhyme test;

and

- less than one-half percent probability of fade below threshold,

although the exact numbers may vary depending on the application. This signal quality measurement, by comparison to a nominal signal quality or grade-of-service objective, provides a second estimate of the power or change required of the near-end transmitter.

To control the transmitter output power of the respective transceiver, each receiver determines the quality of the received signal and provides a local quality signal to its associated transmitter in the respective transceiver indicative of that received signal quality. Each transmitter then transmits the local quality signal provided by the receiver back to the transceiver that transmitted the original transmission. The transceiver is responsive to the local quality signal to control its own transmitter power.

For example, a mobile unit transmits a first signal to a nodal transceiver. The nodal transceiver determines the signal quality of the received signal by analyzing bit error rate, voice diagnostics, fade or the like to provide the local quality signal. The nodal transceiver then transmits the local quality signal back to the mobile unit which processes the local quality signal along with other factors such as received signal strength, or other measurements will known in the art to determine the output power of mobile unit's transmitter. In a preferred embodiment, the local quality signal is appended to the transmission of a second communication signal. In this manner, two way communication provides a carrier signal upon which the local quality signal is transmitted.

Power adjustment based upon path loss reciprocity alone is subject to several sources of error, including, path non-reciprocity (due to frequency difference), staleness due to transit time delay, and local noise or interference anomalies. Compensation for all these effects is provided in the system and method of the invention by a longer term signal quality monitor, which compares recent past actual error rate statistics, (measured in the forward error correction decoder) and compares against prescribed maximum acceptable error rate statistic. In one embodiment, the signal quality monitor includes a history compiler, situated at either the mobile unit or the nodal transceiver, that records and processes additional factors such as past signal quality measurements, position determination of the mobile unit, past measurements of received signal strength, past determinations of the output power of the received signal and other measurements well known to those in the art to provide a more comprehensive determination of actual signal quality. The difference is interpreted as a longer-term signal level deficiency.

This signal level deficiency is then telemetered back to the respondent transceiver as an independent short burst transmission or may be appended to the transmission of a second two-way signal, where it is used to provide a longer term supervisory control over the short term path-reciprocity power adjustment system. Thus, for example, if a mobile terminal passes into an urban area where it suffers deep-fast fades that cannot be fully compensated due to the delay in the path reciprocity sensing power control, the longer term signal quality deficiency estimate will sense this and call for a gradual increase in the reference value calibration of the fast, signal sensing power control.

The two derived estimates of the required near-end transmit power or change in power, (near-end signal strength and far-end signal quality), have complementary error characteristics such that an optimal combination of the two estimates will yield an overall estimate far superior to either one separately. The near-end path loss measurement is fast but error prone. The far-end signal quality measurement is slow but accurate. The invention of the adaptive power control system combines these two available measures into a single control system taking advantage of the better features of each. Several approaches to this combination are possible.

present invention includes an adaptive path loss power control system. In an embodiment of the adaptive path loss power control system, each transmitter telemeters its current signal output level to the counterpart far end receiver by adding a low rate data stream to the composite digital output signal. Using this information along with the measured strength of the received signal and assuming path loss reciprocity, each end can form an estimate of the instantaneous path loss and adjust its current transmit power output to a level which will produce an approximately constant received signal level at the counterpart receiver irrespective of path loss variations.

Referring now to FIGS. 8a through 8h, timing and waveform diagrams of the adaptive path loss system of an adaptive power control system in accordance with the principles of the invention are presented. In this example, the two ends of the communications link are referred to generally as A and B. In the ground cellular application, "A" corresponds to the user and "B" corresponds to the cellular node. In the satellite link, A would be the user and B would be the satellite control node; in this case, the satellite is simply a constant gain repeater and the control of its power output is exercised by the level of the signal sent up to it.

In the example of FIG. 8a, at time 192, the path loss suddenly increases x dB due for example to the mobile user A driving behind a building or other obstruction in the immediate vicinity of A. This causes the signal strength as sensed by A's AGC to decrease x dB as shown in FIG. 8b. The telemetered data at time 192 shown in FIG. 8c indicates that the level at which this signal had been transmitted from B had not been altered, A's power level controller 188 subtracts the telemetered transmitted signal level from the observed received signal level and computes that there has been an increase of x dB in path loss. Accordingly it increases its signal level output by x dB at time 192 as shown in FIG. 8d and at the same time adds this information to its status telemeter channel.

This signal is transmitted to B, arriving after transit time T as shown in FIG. 8e. The B receiver sees a constant received signal strength as shown in FIG. 8f but learns from the telemetered data channel as shown in FIG. 8g that the signal has been sent to him at +x dB. Therefore, B also computes that the path loss has increased x dB, adjusts its output signal level accordingly at FIG. 8h and telemeters that information. That signal increase arrives back at station A at 2T as shown in FIG. 8e thus restoring the nominal signal strength with a delay of two transit times (T). Thus for a path loss variation occurring in the vicinity of A, the path loss compensation at B is seen to be essentially instantaneous while that at A occurs only after a two transit time delay, 2T.

The general hybrid of the adaptive signal quality power control system combined with the adaptive path loss power control system is illustrated in Figure 10. Independent estimates, 250 and 252, of the required power correction are formed based upon the local received signal strength, compensated by telemetered far-end transmit power, and telemetered far-end signal quality as discussed above. These are filtered in filters 256 and 258 and combined in signal summer 260 to provide the best possible power control 260. Based upon estimates or measurements of the true path loss variability power density spectrum, and the power density spectra of the independent estimates 252 and 254, optimal realizable filters 256 and 258 may be designed by well known Wiener methods and specified in terms of their transfer function or impulsive response characteristics.

Alternatively, and more directly relevant to the preferred embodiments, the independent estimates 252 and 254 and the power control output 262 may be in discrete time sampled digital form. The combiner may then be implemented as a finite state machine computer algorithm (constant coefficient digital filter), designed by well known Kalman-Bucy filter estimation methodology based upon the estimated or measured autocorrelation statistics of the true path loss variation and of the estimate errors of 252 and 254. These statistics are directly related to the power density spectral statistics used to describe the analog implementation of the Fourier transforms of one another.

FIG. 9 also shows the operation of an adaptive signal quality power control system acting in concert with the adaptive path loss power control system described above. While FIG. 9 depicts only one of two corresponding transceivers 210 which are in communication with each other, the one not shown functions identically to the one shown in FIG. 9 and described. Receiver 212 receives the signal from the corresponding transceiver and provides a measure indicative of the near-end received signal level deviation from a nominal level 214 by techniques well known to those skilled in the art as a step in determining the path loss. The nominal level is typically calculated to provide a desired minimum acceptable grade of service under average conditions of fading and interference, as is well known to those skilled in the art. The receiver 212 provides a digital output signal 213 based on the received signal. Forward error decoder 216 decodes the digital information in the received signal 213, and in the process provides an error rate measure 218, derived from the fraction of transmitted bits needing correction. The forward error decoded signal 218 is further processed in the signal quality circuit 220 to derive signal quality deficiency; i.e., an estimate of the change in transmit power calculated as that which would be required to just achieve the specified, minimum acceptable error rate under average conditions of fading and interference. The output from the signal quality circuit 220 is provided to an analog-to-digital converter 221 to provide a digital signal to be multiplexed 244. If the error rate is higher than acceptable, the signal quality circuit output 222 will include a power increase command signal and if the error rate is less than acceptable, a transmit power reduction will be output.

The circuit of FIG. 9 also includes a consideration of the signal-to-noise ratio (SNR) in the received signal to determine signal quality. The SNR of the received signal is determined in the receiver 212 by techniques well known to those skilled in the art; for example, the AGC is monitored, and an SNR signal 223 is provided to the signal quality circuit 220. In this embodiment, the signal quality circuit 220 considers both the error rate 218 and the SNR when producing its output control signal 222.

A demultiplexer 224 separates the telemetered data 217 output through the forward error decoder 216 as to far-end signal quality deficiency 226, far-end transmitter power deviation reference 228 from a nominal level, and the traffic signals 230. The far-end transmit power deviation signal 228 is combined 232 with the near-end received signal level deviation 214 to yield a signal 234 representative of the path loss deviation from a nominal reference value. The telemetered far-end signal quality deficiency 226 and the path loss deviation 234 are combined 236 through complementary filters 238 and 240, which may take any of several forms as described above, to yield the transmit power control signal 242 for controlling the output power of the associated transmitter 250. The transmit power control signal 242 is also applied to an analog-to-digital converter 243 to provide a digitized transmit power control signal 245. The resulting transmitter power level deviation from nominal reference 245 and the near-end signal quality 222 deficiency signals are multiplexed 244 with the traffic 246, then forward error encoded 248 and transmitted 250 to the far end transceiver in support of identical functions performed there. In the preferred discrete digitally sampled embodiment, the complementary combining filters 238 and 240 can be designed as optimal estimating filters based upon knowledge of the power requirement signal and measurement error statistics using methods well known to those familiar with estimation theory.

The economic feasibility of a mobile telephone system is related to the number of users that can be supported. Two significant limits on the number of users supported are bandwidth utilization efficiency and power efficiency. In regard to bandwidth utilization efficiency, in either the ground based cellular or mobile satellite elements, radio frequency spectrum allocation is a severely limited commodity. To this end, the power control system of the present invention may be incorporated with other measures to maximize bandwidth utilization efficiency including the use of code division multiple access (CDMA) technology, and spread spectrum communications techniques which provide important spectral utilization efficiency gain and higher spatial frequency reuse, factors made possible by the use of smaller satellite antenna beams.

In regard to power efficiency, which is a major factor for the satellite-mobile links, the power control of the present invention may be combined with the use of forward-error-correcting coding, which in turn is enabled by the above use of spread spectrum code division multiple access (SS/CDMA) technology and by the use of relatively high antenna gain on the satellite. CDMA and forward-error-correction coding are known to those skilled in the art and no further details are given here.

Two-way, adaptive power control and signal quality control system in accordance with the invention provides a flexible capability of providing the following additional special services: high quality, high rate voice and data service; facsimile (the standard group 3 as well as the high speed group 4); two way messaging, i.e. data interchange between mobile terminals at variable rates; automatic position determination and reporting to within several hundred feet; paging rural residential telephone; and private wireless exchange. Additionally, the system obviates the usual practice of continuously transmitting at a power level which is 10 to 40 dB greater than required most of the time in order to provide a margin for accommodating infrequent deep fades.

It is anticipated that the satellite will utilize geostationary orbits but is not restricted to such. The invention permits operating in other orbits as well. While a satellite node has been described above, it is not intended that this be the only means of providing above-ground service. In the case where a satellite has failed or is unable to provide the desired level of service for other reasons, for example, the satellite has been jammed by a hostile entity, an aircraft or other super-surface vehicle may be commissioned to provide the satellite functions described above. The "surface" nodes described above may be located on the ground or in water bodies on the surface of the earth. Additionally, while users have been shown and described as being located in automobiles, other users may exist. For example, a satellite may be a user of the system for communicating signals, just as a ship at sea may or a user on foot.

While several particular forms of the invention have been illustrated and described, it will be apparent that various modifications can be made without departing from the spirit and scope of the invention. Accordingly, it is not intended that the invention be limited, except by the appended claims.

Having described the invention in such terms as to enable those skilled in the art to make and use it and having identified the presently known and preferred best modes thereof, I claim:

1. A cellular communication power control system comprising:

a first transceiver comprising

a first receiver for receiving a first signal,

a quality measurement means for determining the quality of said first signal and for generating a first quality signal representative of the quality of said first signal, and

a first transmitter for transmitting a second signal and said first quality signal;

a second transceiver comprising

a second transmitter for transmitting said first signal,

a second receiver for receiving said second signal and said first quality signal,

a signal strength measurement means for measuring the signal strength of said second signal, a processor means for processing said first quality signal, compiled history data relating to the cellular communication system and said signal strength of said second signal for providing a first path loss signal;

a controller means for controlling the output power level of said first signal in accordance with said first path loss signal; and

a history compilation means for continuously compiling history data relating to the cellular communication system.

2. A cellular communication system as in claim 1 wherein:

said second transceiver further comprises:

a quality means for determining the quality of said second signal and for producing a second quality signal representative of the quality of said second signal, and

said second transmitter for transmitting said first signal and said second quality signal;

said first transceiver further comprises:

said first receiver for receiving said first signal and said second quality signal,

a signal strength measurement means for measuring the signal strength of said first signal,

a processor means for processing said second quality signal, said compiled history data and said signal strength of said first signal for providing a second path loss signal, and a controller means for controlling the output power level of said second signal in accordance with said second path loss signal.

3. A cellular communication system as in claim 1 wherein:

said first transceiver further comprises:

a first level indicator means which generates a first level signal indicative of the output power level of said first transmitter, and

said first transmitter transmits said second signal at a controllable power level and said first level signal;

said second transceiver further comprises:

said processor means further processes said first level signal for comparing said transmitted first level signal to the locally received signal strength of said second signal to provide said first path loss signal.

4. A cellular communication system as in claim 2 wherein:

said first transceiver further comprises:

a first level indicator means which generates a first level signal indicative of the output power level of said first transmitter,

said first transmitter transmits said second signal at a controllable power level and said first level signal, and

said processor means further processes a second level signal for comparing said second level signal to the locally received signal strength of said first signal to provide said second path loss signal;

said second transceiver further comprises:

a second level indicator means which generates said second level signal indicative of the output power level of said second transmitter,

said second transmitter transmits said first signal at a controllable power level and said second level signal, and

said processor means further processes said first level signal for comparing said transmitted first level signal to the locally received signal strength of said second signal to provide said first path loss signal.

5. A method for communicating between first and second transceivers, each transceiver comprising a transmitter and a receiver, the method comprising:

generating a quality signal representative of the quality of a received first signal;

transmitting the quality signal of the respective transceiver and a second signal to the other transceiver;

compiling history data relating to the communication system;

receiving the transmitted quality signal and second signal from the other transceiver;

measuring the signal strength of the received second signal;

processing the quality signal and the signal strength of the second signal to provide a path loss signal; and

controlling the associated transmitter output power level in response to the path loss signal.

6. A cellular communication power control system comprising:

a first transceiver comprising

a first receiver for receiving a first signal,

a quality measurement means for determining the quality of said first signal and for generating a first quality signal representative of the quality of said first signal, and

a first transmitter for transmitting a second signal being different and distinct from said first signal and including said first quality signal;

a second transceiver comprising

a second transmitter for transmitting said first signal,

a second receiver for receiving said second signal and said first quality signal,

a signal strength measurement means for measuring the signal strength of said second signal, a processor means for processing said first quality signal and said signal strength of said second signal for providing a path loss signal, and

controller means for controlling the output power level of said first signal in accordance with said path loss signal.

7. A cellular communication system as in claim 6 wherein:

said second transceiver further comprises:

a quality means for determining the quality of said second signal and for producing a second quality signal representative of the quality of said second signal, and

said second transmitter for transmitting said first signal being different and distinct from said second signal and including said second quality signal;

said first transceiver further comprises:

said first receiver for receiving said first signal and said second quality signal,

a signal strength measurement means for measuring the signal strength of said first signal,

a processor means for processing said second quality signal and said signal strength of said first signal for providing a path loss signal, and a controller means for controlling the output power level of said second signal in accordance with said path loss signal.

8. A cellular communication system as in claim 6 wherein:

said first transceiver further comprises:

a first level indicator means which generates a first level signal indicative of the output power level of said first transmitter, and

said first transmitter transmits said second signal at a controllable power level and said first level signal;

said second transceiver further comprises:

said processor means further processes said first level signal for comparing said transmitted first level signal to the locally received signal strength of said second signal to provide said first path loss signal.

9. A cellular communication system as in claim 7 wherein:

said first transceiver further comprises:

a first level indicator means which generates a first level signal indicative of the output power level of said first transmitter,

said first transmitter transmits said second signal at a controllable power level and said first level signal, and

said processor means further processes a second level signal for comparing said second level signal to the locally received signal strength of said first signal to provide said second path loss signal;

said second transceiver further comprises:

a second level indicator means which generates said second level signal indicative of the output power level of said second transmitter,

said second transmitter transmits said first signal at a controllable power level and said second level signal, and

said processor means further processes said first level signal for comparing said transmitted first level signal to the locally received signal strength of said second signal to provide said first path loss signal.

10. A method for communicating between first and second transceivers, each transceiver comprising a transmitter and a receiver, the method comprising:

generating a quality signal representative of the quality of a received first signal;

transmitting a second signal being different and distinct from said first signal and including the second quality signal to the other transceiver;

receiving the transmitted quality signal and second signal from the other transceiver;

measuring the signal strength of the received second signal;

processing the quality signal and the signal strength of the second signal to provide a path loss signal; and

controlling the associated transmitter output power level in response to the path loss signal.

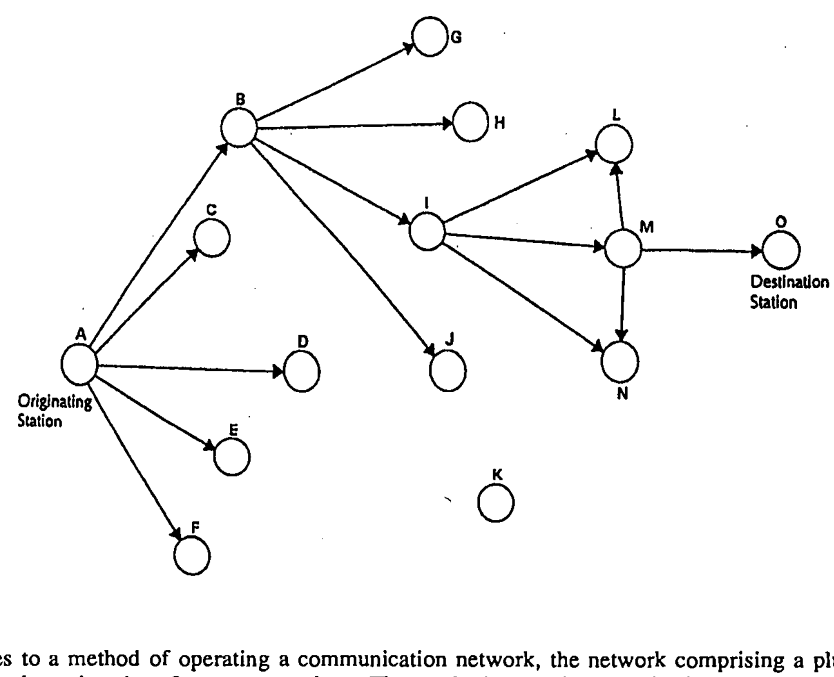
(54) Title: POWER ADAPTION IN A MULTI-STATION NETWORK



(57) Abstract

The invention relates to a method of operating a communication network, the network comprising a plurality of stations which are able to transmit data to and receive data from one another. The method comprises monitoring, at each station, the transmission path quality between that station and each other station with which that station can communicate. Data corresponding to the monitored path quality is recorded at each station, thereby permitting a transmission power value based on the relevant path quality data to be selected when transmitting data to another station. Thus, the probability of transmitting data to any selected station at an optimum power level is increased. Each station transmits path quality data in its own transmissions as well as local noise/interference data, so that other stations can obtain path quality data for a particular station even if they are out of range of that particular station. The invention extends to communication apparatus which can be used to implement the method.

POWER ADAPTION IN A MULTI-STATION NETWORK

BACKGROUND OF THE INVENTION

This invention relates to a method of operating a multi-station communication network and to communication apparatus usable to implement the method.

International patent application no. WO 96/19887 describes a communication network in which individual stations in the network can send messages to other stations by using intermediate stations to relay the message data in an opportunistic manner. In networks of this kind, and in other multi-station networks, it is desirable to control the output power of transmitting stations to a level which is sufficient for successful reception of transmitted data, but which is otherwise as low as possible, to minimise interference with nearby stations or with other users of the radio frequency spectrum.

It is an object of the invention to provide a method of operating a multi-station communication network which addresses the above objective.

SUMMARY OF THE INVENTION

According to the invention there is provided a method of operating a communication network comprising a plurality of stations able to transmit data to and receive data from one another, the method comprising:

monitoring, at each station, the path quality between that station and each other station with which that station communicates;

recording, at each station, path quality data corresponding to the path quality associated with each said other station; and

setting, at each station, a transmission power value based on the recorded path quality data associated with a selected other station when transmitting data to said selected other station, thereby to increase the probability of transmitting data to said selected other station at an optimum power level.

The monitoring of path quality between stations may include monitoring at least one of the path loss, phase distortion, time delay, Doppler shift and multipath fading characteristics of a channel between the stations.

The method preferably includes transmitting path quality data corresponding to the path quality between a first and a second station when transmitting other data between the stations, so that path quality data recorded at the first station is communicated to the second station for use by the second station and vice versa.

The path quality at a station receiving a data transmission may be calculated by comparing the measured power of the received transmission with data in the transmission indicating the transmission power thereof.

A station receiving such path quality data preferably will compare the received path quality data with respective stored path quality data and calculate a path quality correction value from a difference between the received and stored values, the path quality correction value being utilised to adjust the transmission power when transmitting data to the station which transmitted the path quality data.

The path quality correction factor may be calculated by deriving rate of change data from a plurality of path quality correction factor calculations.

The rate of change data may be utilised to adjust the transmission power predictively when transmitting data to a station whose path quality correction value is detected to be changing over time.

The method may include monitoring, from a station transmitting data, the background noise/interference at a station receiving a data transmission and adjusting the transmission power value at the station transmitting data to the receiving station, thereby to maintain the required signal to noise ratio at the receiving station.

The method may include adjusting the data rate of message data transmitted from a first station to a second station according to the transmission power value set at the first station and the required signal to noise ratio at the second station.

The method may also include adjusting the length of message data packets transmitted from a first station to a second station according to the transmission power value set at the first station and the required signal to noise ratio at the second station.

Each station preferably monitors the transmissions of other stations to obtain path quality and background noise/interference data therefrom, so that a first station monitoring a transmission from a second station within range of the first station to a third station out of range of the first station can obtain path quality and background noise/interference data relating to the third station.

The method preferably includes selecting, opportunistically, a station for transmission of data thereto according to the path quality and/or background noise/interference data associated therewith.

Further according to the invention there is provided communication apparatus operable as a station in a network comprising a plurality of stations which can transmit data to and receive data from one another, the communication apparatus comprising:

transmitter means arranged to transmit data to selected stations;

receiver means arranged to receive data transmitted from other stations;

signal strength measuring means for measuring the power of received transmissions;

processor means for recording path quality data corresponding to the path quality associated with other stations; and

control means for adjusting the output power of the transmitter according to the path quality between the apparatus and a destination station.

The processor means is preferably arranged to calculate the path quality by comparing data in received transmissions relating to their transmission power and/or a previously measured path quality with the measurements made by the signal strength measuring means.

The processor means is preferably arranged to monitor at least one of the path loss, phase distortion, time delay, Doppler shift and multipath fading characteristics of a channel between the apparatus and other stations.

The processor means is preferably arranged to extract path quality data from received transmissions, to compare the path quality data with the measured power of received transmissions, and to calculate a path quality correction factor from the difference therebetween, the path quality correction factor being utilised by the control means to adjust the output power of the transmitter.

The processor means may be adapted to derive rate of change data from a plurality of path quality correction factor calculations, thereby to compensate for variations in the path quality between stations.

The processor means is preferably arranged to utilise the rate of change data to adjust the transmission power predictively when transmitting data to a station whose path quality correction value is detected to be changing over time.

Preferably, the processor means is arranged to store path quality data for each of a plurality of stations and to set an initial transmission power value when initiating communication with any of said plurality of stations according to the respective stored path quality data.

The processor means is preferably adapted to monitor transmissions of other stations to obtain path quality and background noise/interference data therefrom, so that the apparatus can select, opportunistically, another station for transmission of data thereto according to the path quality and/or background noise/interference data associated therewith.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is a schematic diagram of a multi-station communication network, indicating how an originating station can transmit data via a plurality of intermediate stations to a destination station;

Figures 2A to 2E comprise together a simplified flow diagram indicating graphically the operation of the method of the invention;

Figures 3 to 6 are schematic block diagrams of apparatus suitable for implementing the invention; and

Figures 7 to 9 are flow diagrams showing the power, modem data rate and packet size adaption processes of the invention, respectively.

DESCRIPTION OF EMBODIMENTS

The network illustrated schematically in Figure 1 comprises a plurality of stations, each comprising a transceiver able to receive and transmit data from any other station within range. A communication network of this kind is described in international patent application no. WO 96/19887, the contents of which are incorporated herein by reference. The stations of the network maintain contact with one another using the probing methodology described in international patent application no. PCT/GB98/01651, the contents of which are also incorporated herein by reference.

Although the method and apparatus of the present invention were designed for use in the above referenced communication network, it should be understood that the application of the present invention is not limited to such a network and can be employed in other networks, including conventional cellular or star networks, or even in a two-way communication situation between first and second stations.

In Figure 1, an originating station A is able to communicate with five "nearby" stations B to F, and is transmitting data to a destination station O via intermediate stations B, I and M.

When any of the stations transmit data to any other station, it is necessary that the transmit power used be sufficient to enable successful reception of the transmitted data at the receiving station. At the same time, to avoid unnecessary energy consumption and interference with other stations in the network, or other communications systems in general, it is desirable to minimise the transmission power utilised.

The problem of setting an optimum transmission power is complicated by variations in the path quality between stations, which may be severe in the case of stations which are moving relative to one another.

In this specification, the expression "path quality" includes path loss (also referred to by those skilled in the art as transmission loss or path attenuation) which is a measure of the power lost in transmitting a signal from one point to another through a particular medium. However, the expression also includes other parameters of the transmission path between any two stations, such as phase distortion, time delay spread, Doppler shift and multipath fading characteristics, which would affect the transmission power required for successful transmission between any two stations.

The present invention addresses this problem by providing a method and apparatus for continually monitoring the path quality between stations and adjusting the transmission power used when transmitting data, so as to use just enough power to ensure successful reception of the transmitted data, without transmitting at a higher power than is required. In addition, other transmission parameters, such as the equalisation and coding applied to the transmitted signals, can be adjusted to improve the likelihood of successful reception.

When a station receives a data package from a remote station it measures the power or strength of the received transmission. This is known as the Received Signal Strength Indicator (RSSI) value of the received transmission. In the data packet from the remote station there is included data corresponding to the transmission power used by the remote station. The local station can therefore calculate the path loss (ie. transmission loss or path attenuation) between the two stations by subtracting the locally measured RSSI value from the transmission power value in any data packet. Whenever a local station responds to a probe signal from a remote station, it will always indicate the path loss it has calculated in the response data packet. Likewise, the local station knows that any data packets addressed to itself will contain data corresponding to the path loss measured by the remote station from the most recent probe signal received by that remote station from the local station.

The local station will compare its calculated path loss with the path loss data received from the remote station, and will use the difference in the path loss values to determine a correction factor to use when transmitting data to the remote station, thereby to adapt its output power to an optimum level, or as close to it as possible.

The first time the local station hears from the remote station it will use a correction factor of:

$Path_{Cor}$ = Remote Path Loss - Local Path Loss

Thereafter:

$Path_{Cor}$ = $Path_{Cor}$+(((Remote Path Loss - Local Path Loss)+$Path_{Cor}$)/2)-$Path_{Cor}$)

where the maximum adjustment made to $Path_{Cor}$ in both cases is 5 dB up or down.

$Path_{Cor}$ may only be a maximum of ± 30dB.

The local station adds the correction factor $Path_{Cor}$ to its measured path loss, thus generating a Corrected Path Loss value when determining what power to use when responding to the remote station. However, the Path Loss value it places in the packet header is its measured Path Loss without correction.

If the local station does not get a direct response from the remote station after ten transmissions then it must increase its $Path_{Cor}$ value by 5dB to a maximum of +10dB. The reason for doing this is to avoid going below the noise threshold of the remote station. (The $Path_{Cor}$ value is added to the measured

Path Loss. The adjusted Path Loss is then used to determine the required transmission power. A smaller value for $Path_{Cor}$ will correspond to a lower transmission power. Therefore, if the $Path_{Cor}$ value is made too small or even negative then the transmission power may be too low to reach the remote station. It is therefore necessary to increase the $Path_{Cor}$ value in 5dB steps until a response from the remote station is detected).

The local station will also not increase its transmission power more than 10dB above normal. This is to avoid swamping other stations if there is an error with the remote station's receiver. However, if the local station does receive a response then the maximum adjustment may go as high as 30dB above normal.

If the RSSI of the remote station is pegged it will set its Path Loss value in the data packet header as 0 (zero). A station will not make any adjustment to its path quality correction factor if either the remote Path Loss in the header is at zero, or if its local RSSI is pegged.

Having calculated the Path Loss and the correction factor $Path_{Cor}$, the local station can now determine the power required to transmit back to the remote station. The remote station also includes in every packet it sends the background RSSI values for the current, previous, and next modem. The local station will use the Corrected Path Loss and the remote background RSSI value to determine what power to use when responding.

Each station has a minimum Signal to Noise (S/N) ratio level that it will try to maintain for each modem. It is assumed that the required Signal to Noise ratio of all the stations in the network is the same. The local station will set the power level for its transmissions such that the remote station will receive them at the correct S/N ratio. If the local station has additional data to send, or if it can operate at a higher data rate, then the required S/N ratio required may vary.

Example 1

Remote station Tx Power	: 40 dBm
Remote Station Background RSSI	: -120 dBm
Remote Station Path Loss	: 140 dB
Local station Required S/N	: 25 dB
Local station Path Loss	: 130 dB

Path_{Cor} = Remote Path Loss - Local Path Loss (Assume first time)
= 140 - 130
= 10 dB

Corrected Path Loss = Local Path Loss + Path_{Cor}
= 130 + 10
= 140 dB

Local Tx Power = Remote RSSI + Required S/N + Corrected Path Loss
= -120 + 25 + 140
= 45 dBm

From the above example it can be seen that the local station must use a Tx Power of 45 dBm to obtain a remote S/N ratio of 25 dB. If the local station can only set its power in 10 dB steps then it must adjust its power up to the next step, ie. 50 dBm.

The power adaption process described above is summarised graphically in the flow chart of Figure 7.

A station may have one or more modems. Each modem operates at a different data rate. However, they all operate in the same channel, ie. frequency and/or medium. Therefore when a station changes channels all the modems will be available on the new channel. A channel may however have a minimum and/or maximum data rate associated with it. For example if a station is on a 80 kbps probing channel it may not use data rates lower than 80 kbps. Therefore it may not use the 8 kbps modem on that channel. In the same way the 8 kbps probing channel may have a maximum bandwidth of 80 kbps, therefore not allowing the use of the 800 kbps modem on that channel.

When a station is probing on a probing channel, it will use the data rate associated with the channel. It will always probe on the channel and at the power required to maintain 5 neighbours.

When a local station responds to the probe of a remote station, or if it responds to a data packet of a remote station, it will always try to use the optimum modem for its response.

A station will always try to respond at the highest data rate possible. The highest data rate will be determined by the maximum data rate allowed for the channel and by, the remote S/N ratio on the modem associated with that data rate.

If a station can use a higher data rate on the channel, it will determine the remote S/N for that data rate. If it can achieve that required S/N ratio it will use the higher data rate. On the other hand, if the conditions are poor and the station can't achieve the required S/N ratio then it will remain at the current data rate. When condition are very poor and the station can't maintain the current data rate, it may even choose to respond at a lower data rate, if the channel allows. It will only use a lower data rate if the S/N ratio of the lower data rate is achieved. If the station cannot use a lower data rate, and if it is on the lowest data rate available then the station will try anyway. However, if there is a lower data rate available, but the station may not use it on the current channel, then the station will not respond to the remote station. This will force the remote station to find a lower data rate channel.

In summary:

- A station will switch to the next modem if the S/N ratio of the next modem meets the required S/N ratio and the maximum modem rate of the channel allows the next modem to be used.

- A station will switch to the previous modem if the S/N ratio of the current modem is below the required S/N ratio and the S/N ratio of the previous modem meets the required S/N ratio and the minimum modem rate of the channel allows the previous modem to be used.

The modem data rate adaption process described above is summarised graphically in the flow chart of Figure 8.

When a station responds to another station it will always try to send as much data as it can. The factors which limit the packet size are: spacing between probes, maximum transmission power, and the allowed transmission duration on a data channel.

In the prototype system, the base packet size is 127 bytes. This is the smallest packet size that will allow data to be reliably transmitted between two stations. (This assumes there is data to send. If a station has no data to send then the packet will always be smaller than 127 bytes.)

A station will use the base packet size under very bad conditions even when it has more data to send. Thus if it is sending to a remote station which has bad background noise, or is very far away, it will only be able to respond at the lowest data rate (8 kbps), and at maximum power.

If a station can achieve a remote S/N ratio better than the base value (i.e. Required S/N for 8 kbps), it may start using larger packets based on the following equations:

For a 10x baud rate increase it will multiply the packet size by a factor

Z. (Typically Z = 4)

Multiplier for packet size = $Z^{\log(X)}$, where X is Baud 2 / Baud 1.

For a 10dB S/N increase, multiply packet size by Y (Typically Y = 2)

Multiplier for packet size = $Y^{W/10}$, where W is additional S/N available.

The values for Z and Y are fixed for the entire network. Typical values for Z and Y are 4 and 2 respectively.

Example 2

If a station can respond at 80 kbps at the required S/N ratio for 80 kbps, it will then use a maximum packet size of 127 * $4^{\log(80000/8000)}$ = 127 * 4 = 508 bytes. If the station cannot fill the packet, it will still use the power required to achieve the required S/N ratio.

Example 3

If a station can respond at 15 dB above the required S/N ratio for 80 kbps, it will then use a maximum packet size of 127 * $4^{\log(80000/8000)}$ * $2^{15/10}$ = 127 * 4 * 2.83 = 1437 bytes. If the station cannot fill the packet it will drop its transmission power to the level required for the packet size it will actually use. For example, even though it could use a packet size of 1437 bytes, if it only has 600 bytes to send to the other station it will adjust its Tx power to a level between the required S/N and 15dB above the required S/N by using the inverse of the equation $Y^{W/10}$ to determine how much additional power it needs above the required S/N ratio.

It is important to note that even though a station may use a larger packet size based on the available S/N ratio and data rate, the packet size may be limited by the probe interval. For example, if the probe interval on the 8 kbps channel is 300 milliseconds, and the maximum packet size based on the available S/N ratio is 600 bytes (which translates to 600 milliseconds at 8 kbps), it can be seen that a packet size of less than 300 bytes must be used, otherwise other stations may corrupt the packet when they probe.

A number of factors must be taken into account when trying to determine the maximum packet size based on the probing rate. These factors include: Tx on delay (the time for the transmitter power amplifier to settle, and for the remote receiver to settle), modem training delay (length of modem training sequence), turnaround delay (time for processor to switch from Rx to Tx, ie. to process data), and propagation delay (time for signal to travel through medium).

To determine the maximum packet size based on the probing rate the following equation is used:

Max Length (ms) = Probe interval - Tx on delay - modem training delay - turnaround delay - propagation delay

The length in bytes can then be determined by:

Max Length (bytes) = Data Rate / 8 * Max Length (seconds)

Example 4

Probe interval is 300 milliseconds on 8 kbps channel. Tx on delay 2 milliseconds, modem training delay is 2 milliseconds, turnaround delay 3 milliseconds, propagation delay 8 milliseconds (worse case for station 1200 km away).

Max Length (ms) = Probe interval - Tx on delay - modem training delay - turnaround delay -propagation delay
= 300 - 2 - 2 - 3 - 8
= 285 ms

Max Length (bytes) = Data Rate / 8 * Max Length (seconds)
= 8000 / 8 * 0.285
= 285 bytes

The packet size adaption process described above is summarised graphically in the flow chart of Figure 9.

Below is a table giving details of the format of Probe and Data packets used in the network of the invention.

Format of Probe and Data packets

Variable	Bit Len	Allows
Preamble	64	Modem training sequence (101010101010 etc ...)
Sync1	8	First Sync Character used to lock Zilog
Sync2	8	Second Sync Character used to lock Zilog
Sync3	8	Third Sync character checked by software
Packet Size	16	Size of packet from Sync3 until last CRC
Size Check	8	Packet Size Check = Packet Size MSB XOR LSB
Protocol Version	8	Protocol Version
Packet Type	8	Packet Type (E.g. Probe, Data, Key, etc.)
Sending ID	32	Sending Station ID
Receiving ID	32	Receiving Station ID (0 = Broadcast)
Packet Number	16	Packet number
Adp Tx Power	8	Sending station current power in dBm
Adp Tx Path Loss	8	Path Loss measured at sending station in dB
Adp Tx Activity	4	Sending station current Activity Level
Adp Tx Antenna	8	Sending station current antenna configuration
Adp Tx Bkg RSSI -1	8	Sending station RSSI in dBm -> Current Modem -1
Adp Tx Bkg RSSI	8	Sending station RSSI in dBm -> Current Modem
Adp Tx Bkg RSSI +1	8	Sending station RSSI in dBm -> Current Modem +1
Adp Tx Spike Noise	8	Spike Frequency & Level at sending station
Adp Rx Activity	4	Required Activity Level for receiving station
Adp Rx Channel	8	Required Rx & Tx Channel for receiving station
Header CRC	16	16 bit CRC for header data
Neigh Routing Flags	8	Bit 0 - In Traffic, Bit 1 - Gateway, Bit 2 - Cert Auth
Neighbour Data Size	16	Size of routing data in bytes = 3 + 4 (Update) + IDs * 6
Neigh Soft Update	32	Software Update Version (16) and Block Number (16)
Neighbour Data	x	Neigh * (32 (ID) + 8 (TxPowerReq) + 4 (ModemReq) + 4 (Flags))
Packet Data	x	
CRC	32	32 bit CRC for whole packet, including header

Preamble:

This is a modem training sequence consisting of alternating 1's and 0's.

Sync1 – Sync3:

These are the three Sync characters that are used to detect the start of a valid packet.

Packet Size:

This is the total size of the packet from Sync3 up to and including the last CRC byte. The maximum packet size that is allowed on a probing channel is determined by the probing rate, ie. a station may not send a packet that is longer (measured in time) than the spacing between probes on the probing channel. The maximum packet size that is allowed on a data channel is determined by the amount of time a station is allowed to remain on a data channel.

Size Check:

This is used to check the Packet Size variable to avoid any invalid long packet receptions.

Protocol Version:

This is used to check which protocol version is being used. If the software can not support the version the packet will be ignored.

Packet Type:

This defines the type of packet being sent. Another packet will directly follow the current packet, if the most significant bit is set.

Receiving ID:

This is the ID of the station to which the packet is addressed.

Sending ID:

This is the ID of the station currently sending the packet.

Packet Number:

Each packet that is transmitted is given a new sequential number. The number is not used in any way by the protocol. It is merely there to provide information to a systems engineer. Each time the station is reset, the packet number starts at a random number. This prevents confusion with older packets.

Adp Tx Power:

The sending station's current power is given as the absolute power in dBm, in the range -80dBm to +70dBm. (Field allows values from -128 dBm to +127 dBm)

Tx Path Loss:

This is the path quality as measured at the sending station. Path Loss = (Remote Tx Power - Local RSSI) of receiving station's previous transmission. A value of 0 is used to indicate that the sending station's RSSI was pegged. The Path Quality is used as a correction factor at the receiving station, for the next time the receiving station transmits to the sending station.

Adp Tx Activity:

This is the activity level of the sending station, measured as: Activity = Watts * Time / (Bandwidth * Success) averaged over time.

Adp Tx Antenna:

This indicates the current antenna configuration being used by the sending station. Each of the 255 possible configurations describes a complete antenna system, i.e. Tx and Rx antenna.

Adp Tx Bkg RSSI:

This is the current background RSSI at the sending station for the modem that it is currently transmitting on. It allows for values from -255 to -1 dBm. The value sent is the absolute value of the RSSI, and the receiving station must multiply the value with -1 to get the correct value in dBm. A value of 0 is used to indicate that the channel is not available or is greater than or equal to 0 dBm. A value of 0 dBm cannot be used for adaptation purposes.

Adp Tx Bkg RSSI –1:

Same as above except for the previous modem.

Adp Tx Bkg RSSI +1:

Same as above except for the next modem.

Tx Spike Noise:

The lower 3 bits for spike frequency in Hz, 0 = none, 1,5,10,50,100,500, & > 500, and the next 5 bits for spike amplitude in dB.

Adp Rx Activity:

If a station has a high activity level and is interfering with other stations, they will use this field to force the active station to drop its activity level. If a number of stations request a drop in activity then the interfering station will respond and drop its activity. If no stations request that such a drop, the active station will slowly start to increase its activity level. Thus if a station is in a very remote area it will keep increasing it activity level trying to generate connectivity. If it is in a very busy area, other stations will keep its activity at a lower level.

In preferred embodiments of the invention, a station will always try to maintain five neighbours, so that other stations should not need to request that the station reduce its activity. However the feature has been provided for cases where stations cannot reduce their power, or increase their data rate any further, yet they still interfere with too many other stations.

Adp Rx Channel:

Allows 255 predefined channels. These channels are set for the entire network. Each channel will have a probing rate associated with it (it may be turned off, which makes it a data channel). Each channel will also have a minimum data rate associated with it. The channels will have the Tx and Tx Frequencies defined. The channels may also be defined as other media, e.g. Satellite, Diginet, ISDN, etc.

A sending station will request that another station move to a data channel (ie. where probing has been disabled) when it has more data to send to the receiving station than can fit in the packet size allowed for the probing channel.

Header CRC:

This is a 16-bit CRC check for the header data. It is the sum of all the bytes in the header. It is only checked if the packet CRC fails. This is provided as a means of determining which station sent the packet. If the packet CRC fails and the header CRC passes, the data provided in the header should be used with caution, since the Header CRC is not a very strong means of error detection.

The Neighbour routing fields given below are not included in the Header CRC since they may not be used unless the packet CRC is passed. This makes the routing less prone to errors.

Neigh Routing Flags:

These flags are used to enhance routing. They provide additional information about the current station. Currently defined bits are:

Bit 0 – Set if current station is busy in traffic.

Bit 1 - Set if current station is an Internet Gateway.

Bit 2 – Set if current station is Certification Authority.

Bit 3 – Reserved.

Another byte of 8 bits could be added should more flags be required.

Neighbour Data Size:

Size of routing data in bytes. This includes the Neigh Routing Flags and Neighbour Data Size (ie. 3 bytes). Another 4 bytes are added if the Neigh Soft Update field is included. An additional 6 bytes are added for each neighbour included in the Neighbour Data section. Neigh Soft Update must be included if any Neighbour Data is included.

Neigh Soft Update:

This is the current version of update software available at the current station (Upper 16 bits of field) and the current block number available (Lower 16 bits of field).

Neighbour Data:

This is the list of neighbours that the current station has routing data for. Every time the current station receives updated routing data for a station that is better than the data it had, it will update its own data and include the station in this list in its next probe. The data section has four sub fields for each station in the list:

Station ID: 32 bit field with the ID of the neighbour station.

Tx Power Req: 8 bit field indicating the combined or direct Tx power required to reach the Station ID from the current station.

Modem Req: Modem required by current station to reach destination station.

Flags: Flags giving additional routing information for destination station. Bit 0 – In Traffic, Bit 1 – Gateway, Bit 3 – Cert Auth, Bit 4 – Direct Neighbour. The last bit indicates that the station in the list is a direct neighbour of the current station.

Packet Data:

This is the data of the packet. It is made up of 1 or more segments. The segments may be of any type, and may have originated or be destined for any ID.

CRC:

This is a 32 bit CRC check for the entire packet. If this CRC fails the packet data is discarded, however the header data may still be salvaged if the header CRC passes.

Enhanced method

The flow diagram of Figures 2A to 2D shows the process of measurement and power control and calibration carried out in the network of Figure 1. The originating station A measures the signal strength it receives from station B. In addition, station A identifies station B from its transmission headers and identifies which station it is addressing and what information is being sent. Station A then reads the transmit power and noise/interference level embedded in station B's header, thereby deriving from it the power level that Station B is using to reach the station it is addressing as well as its local noise/interference floor. Station A can then compute the path quality from station B to station A by using its measured signal strength and the declared power level of station B.

If station B is responding to another station such as station C, station A can read from station B's header its declared path quality to station C, thereby deriving information as to fluctuating path qualities between stations B and C , by simply monitoring the transmission of station B. In addition, since station B declares its transmitted power in responding to station C in conjunction with the path loss declared by station B to station C, it is possible for station A to compute the noise/interference floor at station C even though it cannot hear the transmissions of station C.

By monitoring the transmissions of station B at station A when station B transmits to station C, the path quality, required power level and noise/interference floor of both stations B and C may be derived, even though station C is "out of range" of station A.

If station B is probing and is not responding to any other station, no other information as to path quality or required path quality can be derived from its transmissions apart from calculating the effective path quality from A to B. If station A monitors station B responding to station A and reads the calculated path quality to station A embedded in station B's header, station A can then compare this calculated path quality to that read from station B and calculates a differential. Station A uses the differential to update its average path quality differential. This is done by comparing the path quality it computes to that which station B computes, and that differential is as a result of differences in the methods of measurement and other inaccuracies of the two stations.

However, since there is a fluctuation in path quality between transmissions it is possible that the path quality changes from the time that station B calculated the path quality from station A to station B, to the time that station A calculated the path quality from station B to station A. Therefore, a rate of change can be calculated over and above the differential long-term averaging which is a result of measurement inaccuracy. This rate of change will be due to the rate of change of the actual path quality due to propagation changes between transmissions.

Station A may also use a noise/interference level declared by station B to update its database to indicate the slow rate of change of noise/interference, based upon past records at station B and also fast fluctuations that may be in the noise/interference floor of B. Station A may then use the predicted fluctuations in the path quality from station A to station B and the predicted fluctuations in the rate of change of noise/interference in order to predict an opportunity to transmit to station B. This is done so as to choose periods of minimum path quality or minimum noise floor between stations A and B. Since station A is gathering data from other stations, for example stations B, C, D, E and F, it can decide whether station B provides the best opportunity, or whether it should choose one of the other stations. In addition, it can choose its data rate, packet duration and transmitter power based upon the rate of change and duration of the fluctuations of path quality and noise/interference that exist between stations A and B.

If station A chooses station B to transmit data to, it receives an acknowledgement back from station B, and the information is then forwarded on from station B opportunistically to the other stations. It is important to note that by monitoring the transmissions from station B, station A also has an idea of the path quality from station B to stations G, H, I, J, K, etc., and other stations to which station B can transmit. By monitoring those transmissions, it picks up the fluctuations in path quality between station B and the other stations and an indication of the noise/interference floor fluctuations of the other stations even if those other stations are not directly monitored by station A. Using this technique an opportunistic relay station can be chosen, taking not just the first hop but two hops into account and, providing overall routing information is available, data can be routed effectively towards the destination station O.

Hardware

Figures 3, 4, 5 and 6 show the basic hardware used to implement the invention. These Figures correspond to Figures 8, 9, 10 and 11 of the abovementioned international patent application no. WO 96/19887.

Based upon its "decision" to transmit, the main processor 149 will decide on a power level data rate and packet duration to use and will send this packet to the serial controller 131 and simultaneously through the peripheral interface 147 switch the transmit/receive switch 103 into transmit mode and switch the transmitter on after a suitable delay. The Zilog chip 131 will send the packet data together with a suitable header and CRC check via the PN sequence encoders in block 128 or 130, depending on the data rate chosen.

The main processor 149 will embed in the data packet, as one of the fields of information, data corresponding to the transmit power it is using, which will be the same transmit power as sent to the power control PIC block 132, which in turn is used to drive the power control circuit 141, which in turn controls the gain control and low pass filter block 143. This block in turn uses feedback from the power amplifier 145 to control the drivers 144 and 142.

The sensing and gain feedback method allows a reasonably accurate power level to be derived based upon the instruction from the power control circuit 141.

Prior to switching the power amplifier on, the transmission frequency is selected by the synthesizer 138, after which the power amplifier 145 is instructed via the driver block 141 and the amplifier is switched on.

If power levels below the minimum power level provided by the power amplifier 145 are required, the switched attenuator block 102 may be switched in, in order to provide up to an additional 40 dB of attenuation. Therefore the processor can instruct the power amplifier to switch in an attenuator combination to provide an output power level ranging from minus 40 dBm to plus 50 dBm. When the amplifier is switched on, the processor obtains information from the low power sensing circuit 101 as to the forward and reverse power, which is sent via the analogue to digital converter 146 and is used by the main processor 149 in order to monitor the level of power being transmitted. This information is then stored in the dynamic RAM 150 to provide information as to forward and reflected power levels actually generated by comparison to the level requested.

The amount of output transmit power will be affected by the efficiency of the transmit power control loop (blocks 145, 144, 142 and 143) and the switched attenuator block 102. In addition, any mismatch in the antenna 100 will also result in variations in reflected and forward power. The relative power actually output for various levels required can be stored by the processor in the RAM providing a table giving requested against actual power output levels. This can be used to allow the processor to use a more accurate power level field in the information it provides on future transmissions, within messages or probe signals. Since the power level is varied from between minus 40 dBm to plus 50 dBm there are effectively ten different power levels spaced 10 dB apart that may be transmitted. Therefore, the table stored by the processor will have these ten power levels, with the requested power level and actual power level being in this range.

Any other station in the network will then receive this transmission via its antenna 100. The received signal will then pass through the low power sensing circuit 101 and the switched attenuator 102, which initially is set for 0 dB attenuation. It will then pass through the 2 MHz bandpass filter 104, which will remove out of band interference, and then passes into the preamplifier 105, which amplifies the signal before it is mixed down via the mixer 106 to a 10.7 MHz IF signal. This signal is filtered by the bandpass filler 107, and amplified in the IF amplifier 108 and further filtered and amplified in blocks 109, 110, 111 and 112.

The final filtering occurs at blocks 114 and 115, at which stage the signal is measured at block 116 using the narrowband RSSI function, the output of which is used via the main processor to determine the signal strength of the incoming transmission. This then allows the processor, if necessary, to request the power control PIC circuit 132 to switch in additional receiver attenuation up to 40 dB. The switching in of additional attenuation in will only be necessary if the signal exceeds the measurement range of the NE615 of block 116. Otherwise, the attenuator is left at 0 dB attenuation, allowing the full sensitivity of the receiver to be available for receiving small signals. The incoming transmission is measured in two bandwidths simultaneously, namely 8 kHz and 80 kHz. The 80 kHz bandwidth is measured by tapping off the 10.7 MHz IF signal after the 150 kHz ceramic filter 109 and using a 150 kHz ceramic filter 121 and an NE604 IC 120. This, too, has an RSSI output which is received via the interface by the main processor 149.

The broadband and narrowband RSSI are measured via the analogue to digital converter 146, which then passes the data on to the main processor 149. The main processor has a lookup table, and takes the information from the A to D converter and derives from previously calibrated data a receive signal strength. This data is calibrated in dBm, typically from minus 140 dBm to 0 dBm. This information is typically generated using the output of a calibrated signal generator, injecting this into the input of the receiver, and then dialling up various signal strength levels and instructing the processor via the keyboard 209 as to what power levels are being injected. This information is then stored permanently in static RAM or flash RAM 150.

Therefore, the receiving station can accurately record the power level of any incoming transmission. It then reads the address of the incoming transmission and its embedded transmit power level. By comparing these, for example, a plus 40 dBm transmit power level may be measured in the receiver as minus 90 dBm and this is then used to compute a path loss of 130 dB. Path losses may vary from 0 dB up to a maximum of 190 dB (+50 - (-140) = 190). The minimum path loss that can be measured is dependent on the transmission power of the transmitting station and the maximum signal that can be measured by the receiving station. Since with this design the maximum receiving signal is 0 dBm at the antenna port 100, a 0 dB path loss can be measured, providing the transmit power is less than 0 dBm. Otherwise, for example, at a transmit power of 50 dBm the minimum path loss that can be measured is 50 dB. This could be improved by adding additional steps in the switched attenuator or through using a different arrangement in the receiver. If the switched attenuator is fully switched in and the output of the A to D converter indicates that the RSSI is at its highest level, the receiving processor will tag the data associated with the transmission as being "pegged". This means that the path loss is less than is measurable.

The processor on receive will continually measure the background signal and interference, and providing that no transmissions are detected on either modem at either data rate, will monitor and measure the noise and interference in dBm and generate an average which will be stored in the static RAM. When a transmission is detected, the most recent noise measurement is compared to the signal strength to derive a signal to noise ratio. On each transmission, the background noise picked up prior to transmission is advertised inside the transmission message or probe as another field together with the transmitted power. Other stations in the network can pick up and derive from transmission not only the path quality but also the distant station's noise floor just prior to its transmission. The receiving station, since it knows the path quality and has the noise floor of the distant station, will then know at what power to transmit to achieve any desired signal to noise ratio at the distant station.

The required signal to noise ratio is typically based upon the performance of the modem and a figure based upon packet duration and probability of success. This required signal to noise ratio is stored in the database by the processor and is continually updated, based upon the success of transmissions to various destinations. If a station, for example, picks up a transmission and calculates the path loss to be 100 dB and the distant station to have a declared noise floor of minus 120 dBm, to meet the required signal to noise ratio of for example, 20 dB for 8 kilobits per second, it will then transmit at a power level of minus 20 dBm. This required signal to noise ratio will be different for 80 kilobits per second in that the noise floor would be higher in the wider bandwidth of 150 kHz by comparison to 15kHz and in that the performance of the 80 kilobits per second modem may be different from that of the 8 kilobits per second modem.

Therefore, the receiving station would know that if, for example, the declared noise floor in the wideband is minus 110 dBm and the path loss is still 100 dB, but the required signal to noise ratio is, for example, 15 dB, it would require a transmission power of plus 5 dBm. The station receiving the transmission will know what power level to use to respond to the originating station.

Monitoring other communicating stations, the receiving station will see the path quality variation and the noise floor declared by various other stations it is monitoring varying as well, and through choosing a moment of minimum path quality and minimum noise floor will transmit at the appropriate power level to achieve the required signal to noise ratio to the station or stations that it is monitoring. In responding to a transmission, the responding station will switch on its transmitter, control the power amplifier via the power control PIC 132 to meet the required power level and then the main processor 149 will embed the fields of its own transmit power, its own receive noise prior to transmission and the path quality that it has just received from the station to which it is responding.

Depending on the signal to noise ratio and the power level required, the main processor will elect to switch in either the 80 kilobit per second or 8 kilobit per second modem and make the transmission. On making this transmission, it will embed its own transmit power level, its own background noise floor measured in both the 150 kHz and 15 kHz bandwidth and the path quality it has just calculated for the transmission to which it is responding. The originating station, on receiving the transmission, will again measure the RSSI in the two bandwidths and via the A to D converter 146, and using the lookup table in the static RAM 150, calculate the received signal strength. By examining the received packet passed from the Zilog synchronous serial chip 131, it will calculate the received path loss using the transmitter power declared and the measured RSSI and compare the path loss value sent to it by the other station.

In comparing these two path losses, since only a short period of time has elapsed between transmission and reception, these two path losses should be quite similar unless the path loss is fluctuating, caused perhaps by a moving vehicle environment. In successive transmissions, the difference between the two path loss values is averaged and stored since this number represents the difference due to measurement error in signal strength or error in the declared power level being transmitted. The averaging process is used to average out, say, the effects of moving vehicles and path loss fluctuation. The main processor will use this averaged number and retain one for every station in the network. It will have a path loss correction factor or delta ranging from a few dB to tens of dB for each station in the network which it will store in RAM. On detecting any station transmitting and measuring the path loss, the correction factor is then used to correct the transmit power level before responding to the station, ie. predictively . A typical process is as follows:

Station A measures the incoming path loss from Station B, of say 100 dB. Station A looks at Station B's address which is then compared to a lookup table to determine a correction factor or delta, for example 10 dB plus. This means that the path loss as measured by Station A is on average 10 dB higher than that measured by Station B. Based upon the path loss just measured by Station A and Station B's, noise, the power level required is calculated by Station A to meet the required signal to noise ratio at Station B. The difference allowed between the declared path loss by Station B and the measured path loss by Station A is stored by Station A. If a strong variation is detected, this is in all probability due to fluctuating path loss between transmissions, and therefore the receive signal strength is used to determine the path loss by Station A. The difference between the path loss values is used to update the average differential number, which over a number of transmissions will average any fluctuations in path loss between transmission and response.

Having the differential number is also useful, in that on hearing a station probing or communicating to any other station, a path loss can be calculated using the correction factor and an estimation can be made of the required transmit power to use to reach the distant station with sufficient signal to noise ratio. The path loss delta or correction factor is only updated when stations are interacting with each other and this field will only be present in a transmission when a station is responding to another, and will not be present when another station is simply probing, when this field is left empty.

Although embodiments of the invention have been described above with specific reference to the measurement of path loss in the sense of path attenuation or transmission loss, it will be understood that additional path quality parameters such as those referred to above can be measured to provide a more accurate path quality value for use in adjusting the transmission power used when transmitting data between stations.

CLAIMS:

1. A method of operating a communication network comprising a plurality of stations able to transmit data to and receive data from one another, the method comprising:

   monitoring, at each station, the path quality between that station and each other station with which that station communicates;

   recording, at each station, path quality data corresponding to the path quality associated with each said other station; and

   setting, at each station, a transmission power value based on the recorded path quality data associated with a selected other station when transmitting data to said selected other station, thereby to increase the probability of transmitting data to said selected other station at an optimum power level.

2. A method according to claim 1 wherein the monitoring of path quality between stations includes monitoring at least one of the path loss, phase distortion, time delay, Doppler shift and multipath fading characteristics of a channel between the stations.

3. A method according to claim 1 or claim 2 including transmitting path quality data corresponding to the path quality between a first and a second station when transmitting other data between the stations, so that path quality data recorded at the first station is communicated to the second station for use by the second station and vice versa.

4. A method according to any one of claims 1 to 3 wherein the path quality at a station receiving a data transmission is calculated by comparing the measured power of the received transmission with data in the transmission indicating the transmission power thereof.

5. A method according to claim 4 wherein a station receiving such path quality data compares the received path quality data with respective stored path quality data and calculates a path quality correction value from a difference between the received and stored values, the path quality correction value being utilised to adjust the transmission power when transmitting data to the station which transmitted the path quality data.

6. A method according to claim 5 wherein the path quality correction factor is calculated by deriving rate of change data from a plurality of path quality correction factor calculations.

7. A method according to claim 6 wherein the rate of change data is utilised to adjust the transmission power predictively when transmitting data to a station whose path quality correction value is detected to be changing over time.

8. A method according to any one of claims 4 to 7 including monitoring, from a station transmitting data, the background noise/interference at a station receiving a data transmission and adjusting the transmission power value at the station transmitting data to the receiving station, thereby to maintain the required signal to noise ratio at the receiving station.

9. A method according to claim 8 including adjusting the data rate of message data transmitted from a first station to a second station according to the transmission power value set at the first station and the required signal to noise ratio at the second station.

10. A method according to claim 8 or claim 9 including adjusting the length of message data packets transmitted from a first station to a second station according to the transmission power value set at the first station and the required signal to noise ratio at the second station.

11. A method according to any one of claims 1 to 10 wherein each station monitors the transmissions of other stations to obtain path quality and background noise/interference data therefrom, so that a first station monitoring a transmission from a second station within range of the first station to a third station out of range of the first station can obtain path quality and background noise/interference data relating to the third station.

12. A method according to any one of claims 1 to 11 including selecting, opportunistically, a station for transmission of data thereto according to the path quality and/or background noise/interference data associated therewith.

13. Communication apparatus operable as a station in a network comprising a plurality of stations which can transmit data to and receive data from one another, the communication apparatus comprising:

transmitter means arranged to transmit data to selected stations;

receiver means arranged to receive data transmitted from other stations;

signal strength measuring means for measuring the power of received transmissions;

processor means for recording path quality data corresponding to the path quality associated with other stations; and

control means for adjusting the output power of the transmitter according to the path quality between the apparatus and a destination station.

14. Communication apparatus according to claim 13 wherein the processor means is arranged to calculate the path quality by comparing data in received transmissions relating to their transmission power and/or a previously measured path quality with the measurements made by the signal strength measuring means.

15. Communication apparatus according to claim 14 wherein the processor means is arranged to monitor at least one of the path loss, phase distortion, time delay, Doppler shift and multipath fading characteristics of a channel between the apparatus and other stations.

16. Communication apparatus according to claim 14 or claim 15 wherein the processor means is arranged to extract path quality data from received transmissions, to compare the path quality data with the measured power of received transmissions, and to calculate a path quality correction factor from the difference therebetween, the path quality correction factor being utilised by the control means to adjust the output power of the transmitter.

17. Communication apparatus according to claim 16 wherein the processor means is adapted to derive rate of change data from a plurality of path quality correction factor calculations, thereby to compensate for variations in the path quality between stations.

18. Communication apparatus according to claim 17 wherein the processor means is arranged to utilise the rate of change data to adjust the transmission power predictively when transmitting data to a station whose path quality correction value is detected to be changing over time.

19. Communication apparatus according to claim 17 or claim 18 wherein the processor means is arranged to store path quality data for each of a plurality of stations and to set an initial transmission power value when initiating communication with any of said plurality of stations according to the respective stored path quality data.

20. Communication apparatus according to any one of claims 13 to 19 wherein the processor means is adapted to monitor transmissions of other stations to obtain path quality and background noise/interference data therefrom, so that the apparatus can select, opportunistically, another station for transmission of data thereto according to the path quality and/or background noise/interference data associated therewith.

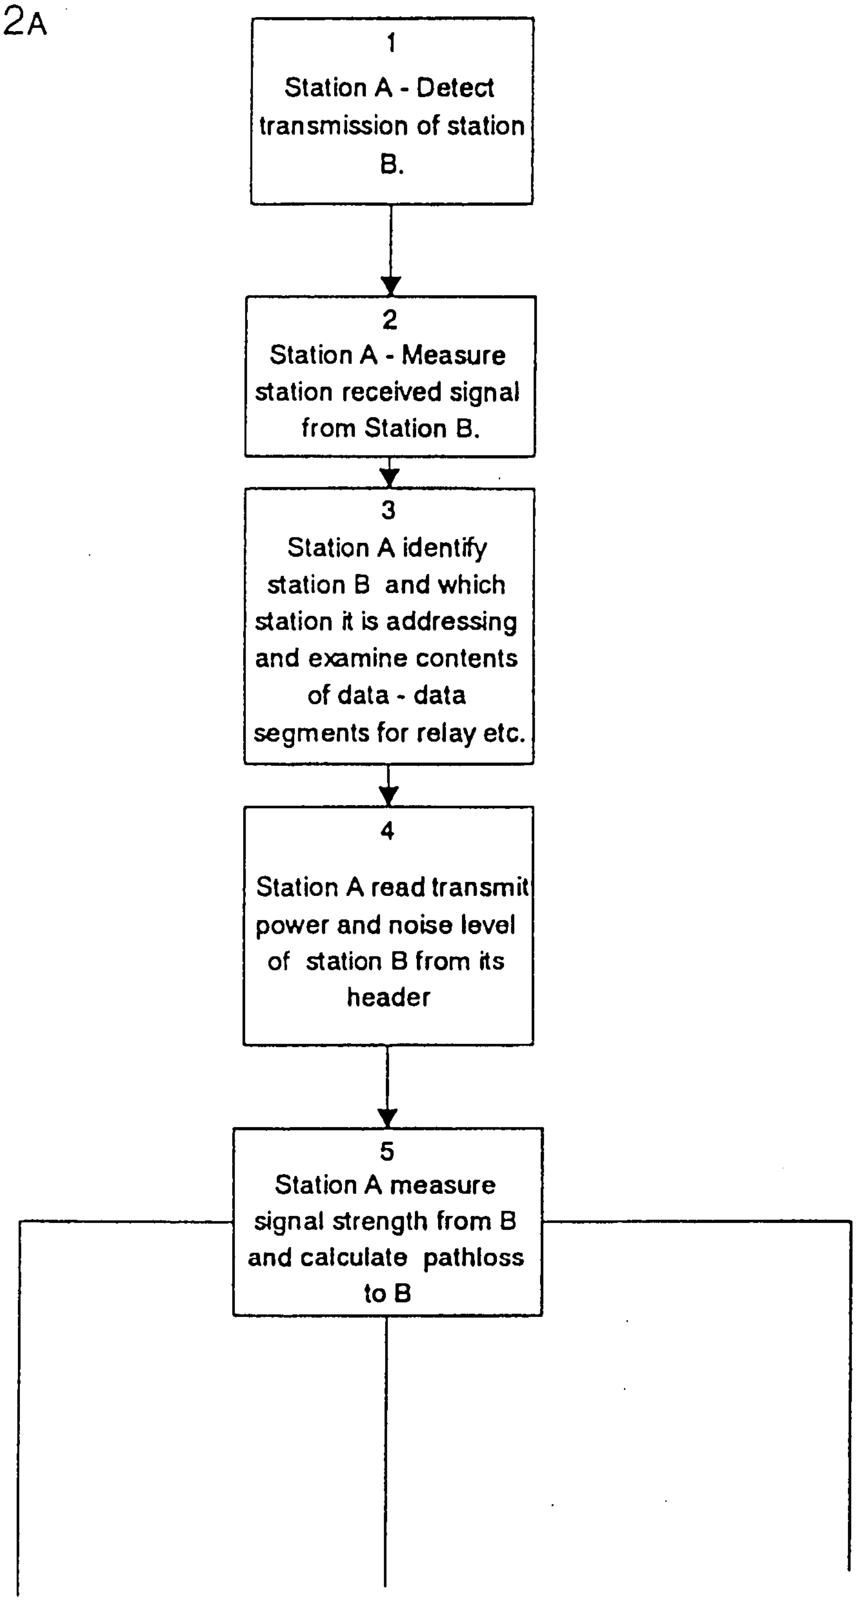
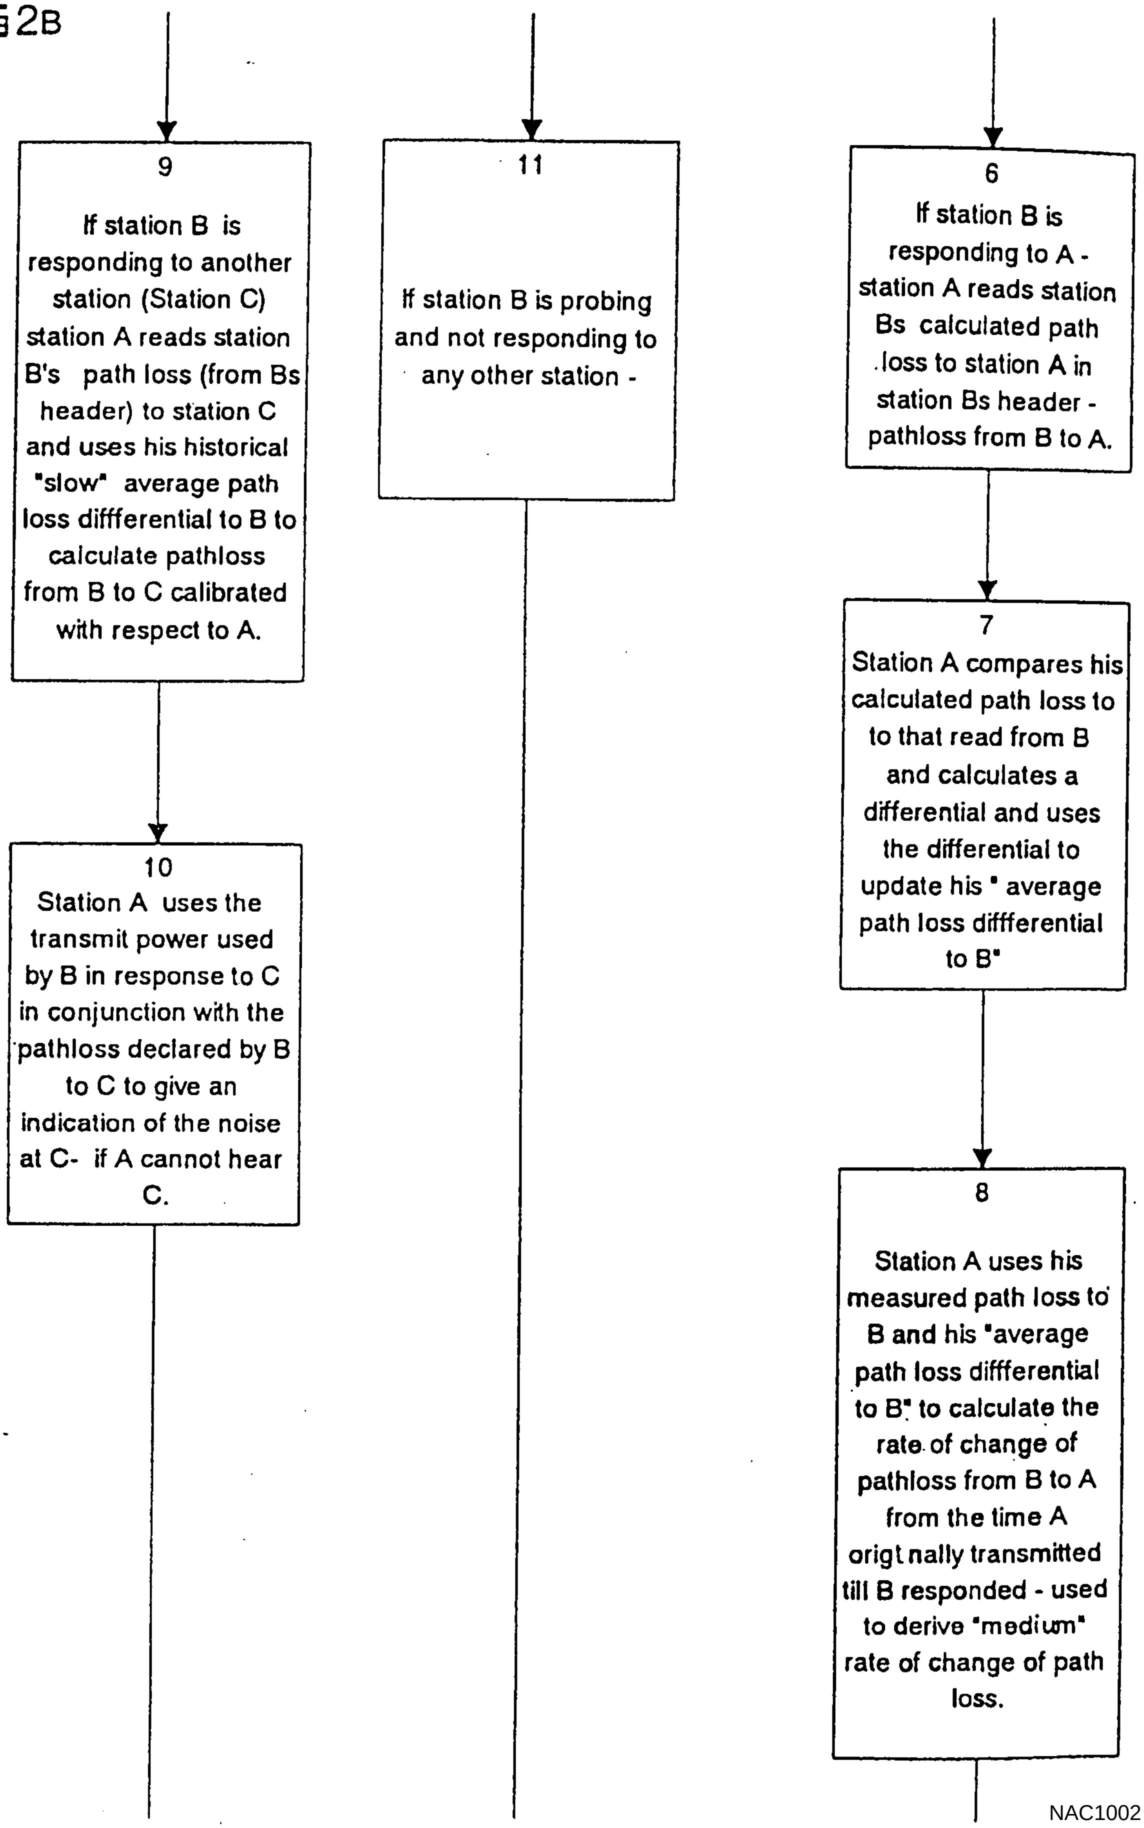
Fig 1

Fig 2A



1
Station A - Detect transmission of station B.
2
Station A - Measure station received signal from Station B.
3
Station A identify station B and which station it is addressing and examine contents of data - data segments for relay etc.
4
Station A read transmit power and noise level of station B from its header
5
Station A measure signal strength from B and calculate pathloss to B

FIG 2B



9
If station B is responding to another station (Station C) station A reads station B's path loss (from Bs header) to station C and uses his historical "slow" average path loss diffferential to B to calculate pathloss from B to C calibrated with respect to A.
10
Station A uses the transmit power used by B in response to C in conjunction with the pathloss declared by B to C to give an indication of the noise at C- if A cannot hear C.
11
If station B is probing and not responding to any other station -
6
If station B is responding to A - station A reads station Bs calculated path loss to station A in station Bs header - pathloss from B to A.
7
Station A compares his calculated path loss to to that read from B and calculates a differential and uses the differential to update his " average path loss diffferential to B"
8
Station A uses his measured path loss to B and his "average path loss diffferential to B" to calculate the rate of change of pathloss from B to A from the time A origtnally transmitted till B responded - used to derive "medium" rate of change of path loss.

12

Station A uses his measured path loss to B and the rate of change of this path loss during B's transmission to calculate pathloss from B to A and "fast" path loss variation from B to A - taking into account the correction factor -" average path loss diffferential to B"

Fig 2C

13

Station A uses his calculated pathloss from B to A and updates his database and calculates a "slow" rate of change of pathloss based on past records - used to determine intermediate pathloss variation.

14

Station A uses the noise level declared by B to update his database and calculates a "slow" rate of change of noise based on past records - used to determine intermediate noise variation.

FIG 2D

15
Station A uses calculated pathloss from B to A in conjunction with station B local noise (from Bs header) to calculate transmit power required to reach B - taking into account the rate of change of pathloss and noise from database both "fast" and "medium".

16
If the measured data indicates a "minimum" in path loss and/or a "minimum" in noise floor at B an "opportunity" is identified between A and B.

17
If A has data for B as a final destination or a relay - and the "opportunity" identified by A to B is better than any other "opportunity" to any other station at that moment - A decides to transmit to B.

FIG 2E

18
A choses datarate and packet duration based on the ammount of transmit power available at A and the required signal to noise ratio for different data rates and packet durations at B - taking into account the rate of change of pathloss from A to B and noise at B.

19
A examines its transmit data que destined for B as a final destination or relay and "fills" the packet with data segments - were packet size is determined by data rate and duration decided on for the opportunity.

20
A receives acknowledgement from B or monitors to hear B transmit data further,

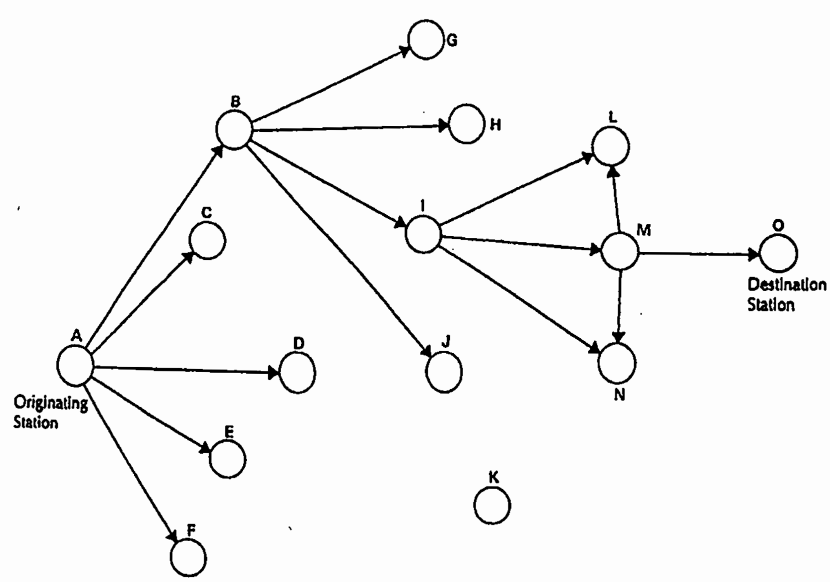
(54) Title: POWER ADAPTION IN A MULTI-STATION NETWORK



(57) Abstract

The invention relates to a method of operating a communication network, the network comprising a plurality of stations which are able to transmit data to and receive data from one another. The method comprises monitoring, at each station, the transmission path quality between that station and each other station with which that station can communicate. Data corresponding to the monitored path quality is recorded at each station, thereby permitting a transmission power value based on the relevant path quality data to be selected when transmitting data to another station. Thus, the probability of transmitting data to any selected station at an optimum power level is increased. Each station transmits path quality data in its own transmissions as well as local noise/interference data, so that other stations can obtain path quality data for a particular station even if they are out of range of that particular station. The invention extends to communication apparatus which can be used to implement the method.

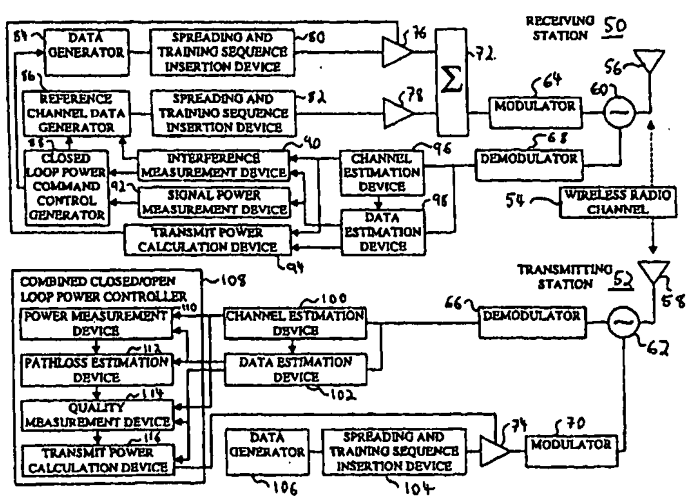
(54) Title: COMBINED CLOSED LOOP/OPEN LOOP POWER CONTROL IN A TIME DIVISION DUPLEX COMMUNICATION SYSTEM



(57) Abstract

Combined closed loop/open loop power control controls transmission power levels in a spread spectrum time division duplex communication station. A first communication station (50) receives communications from a second communication station (52). The first station transmits power commands based on in part a reception quality of the received communications. The first station transmits a second communication having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured. A path loss estimate is determined based on in part the measured received second communication power level and the first communication transmission power level. The second station transmits a second communication to the first station in a second time slot. The second communication transmission power level is set based on in part the path loss estimate weighted by a factor and the power commands. The factor is a function of a time separation of the first and second time slots.

COMBINED CLOSED LOOP/OPEN LOOP POWER CONTROL IN A TIME DIVISION DUPLEX COMMUNICATION SYSTEM

BACKGROUND

This invention generally relates to spread spectrum time division duplex (TDD) communication systems. More particularly, the present invention relates to a system and method for controlling transmission power within TDD communication systems.

Figure 1 depicts a wireless spread spectrum time division duplex (TDD) communication system. The system has a plurality of base stations **30_1-30_7**. Each base station **30_1** communicates with user equipments (UEs) **32_1-32_3** in its operating area. Communications transmitted from a base station **30_1** to a UE **32_1** are referred to as downlink communications and communications transmitted from a UE **32_1** to a base station **30_1** are referred to as uplink communications.

In addition to communicating over different frequency spectrums, spread spectrum TDD systems carry multiple communications over the same spectrum. The multiple signals are distinguished by their respective chip code sequences (codes). Also, to more efficiently use the spread spectrum, TDD systems as illustrated in **Figure 2** use repeating frames **34** divided into a number of time slots **36_1-$36_{n,}$**, such as fifteen time slots. In such systems, a communication is sent in selected time slots **36_1-36_n** using selected codes. Accordingly, one frame **34** is capable of carrying multiple communications distinguished by both time slot **36_1-36_n** and code. The combination of a single code in a single time slot is referred to as a resource unit. Based on the bandwidth required to support a communication, one or multiple resource units are assigned to that communication.

Most TDD systems adaptively control transmission power levels. In a TDD system, many communications may share the same time slot and spectrum. When a UE **32**$_1$ or base station **30**$_1$ is receiving a specific communication, all the other communications using the same time slot and spectrum cause interference to the specific communication. Increasing the transmission power level of one communication degrades the signal quality of all other communications within that time slot and spectrum. However, reducing the transmission power level too far results in undesirable signal to noise ratios (SNRs) and bit error rates (BERs) at the receivers. To maintain both the signal quality of communications and low transmission power levels, transmission power control is used.

One approach to control transmission power levels is open loop power control. In open loop power control, typically a base station **30**$_1$ transmits to a UE **32**$_1$ a reference downlink communication and the transmission power level of that communication. The UE **32**$_1$ receives the reference communication and measures its received power level. By subtracting the received power level from the transmission power level, a pathloss for the reference communication is determined. To determine a transmission power level for the uplink, the downlink pathloss is added to a desired received power level at the base station **30**$_1$. The UE's transmission power level is set to the determined uplink transmission power level.

Another approach to control transmission power level is closed loop power control. In closed loop power control, typically the base station **30_1** determines the signal to interference ratio (SIR) of a communication received from the UE **32_1**. The determined SIR is compared to a target SIR (SIR_{TARGET}). Based on the comparison, the base station **30_1** transmits a power command, b_{TPC}. After receiving the power command, the UE **32_1** increases or decreases its transmission power level based on the received power command.

Both closed loop and open loop power control have disadvantages. Under certain conditions, the performance of closed loop systems degrades. For instance, if communications sent between a UE and a base station are in a highly dynamic environment, such as due to the UE moving, such systems may not be able to adapt fast enough to compensate for the changes. The update rate of closed loop power control in TDD is 100 cycles per second which is not sufficient for fast fading channels. Open loop power control is sensitive to uncertainties in the uplink and downlink gain chains and interference levels.

One approach to combining closed loop and open loop power control was proposed by the Association of Radio Industries and Business (ARIB) and uses **Equations 1**, **2**, and **3**.

$$T_{UE} = P_{BS}(n) + L \qquad \textbf{Equation 1}$$

$$P_{BS}(n) = P_{BS}(n-1) + b_{TPC}\,\Delta_{TPC} \qquad \textbf{Equation 2}$$

$$b_{TPC} = \begin{cases} 1: \text{if } SIR_{BS} < SIR_{TARGET} \\ -1: \text{if } SIR_{BS} > SIR_{TARGET} \end{cases} \qquad \textbf{Equation 3}$$

T_{UE} is the determined transmission power level of the UE **32**$_1$. L is the estimated downlink pathloss. $P_{BS}(n)$ is the desired received power level of the base station **30**$_1$ as adjusted by **Equation 2**. For each received power command, b_{TPC}, the desired received power level is increased or decreased by Δ_{TPC}. Δ_{TPC} is typically one decibel (dB). The power command, b_{TPC}, is one, when the SIR of the UE's uplink communication as measured at the base station **30**, SIR_{BS}, is less than a target SIR, SIR_{TARGET}. Conversely, the power command is minus one, when SIR_{BS} is larger than SIR_{TARGET}.

Under certain conditions, the performance of these systems degrades. For instance, if communications sent between a UE **32** and a base station **30** are in a highly dynamic environment, such as due to the UE **32** moving, the path loss estimate for open loop severely degrades the overall system's performance. Accordingly, there is a need for alternate approaches to maintain signal quality and low transmission power levels for all environments and scenarios.

SUMMARY

Combined closed loop/open loop power control controls transmission power levels in a spread spectrum time division duplex communication station. A first communication station receives communications from a second communication station. The first station transmits power commands based on in part a reception quality of the received communications. The first station transmits a second communication having a transmission power level in a first time slot. The second

station receives the second communication and the power commands. A power level of the second communication as received is measured. A path loss estimate is determined based on in part the measured received second communication power level and the first communication transmission power level. The second station transmits a second communication to the first station in a second time slot. The second communication transmission power level is set based on in part the path loss estimate weighted by a factor and the power commands. The factor is a function of a time separation of the first and second time slots.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 illustrates a prior art TDD system.

Figure 2 illustrates time slots in repeating frames of a TDD system.

Figure 3 is a flow chart of combine closed loop/open loop power control.

Figure 4 is a diagram of components of two communication stations using combined closed loop/open loop power control.

Figures 5-10 depict graphs of the performance of a closed loop, ARIB's proposal and two (2) schemes of combined closed loop/open loop power control.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The preferred embodiments will be described with reference to the drawing figures where like numerals represent like elements throughout. Combined closed loop/open loop power control will be explained using the flow chart of **Figure 3** and the components of two simplified communication stations **50**, **52** as shown in **Figure 4**. For the following discussion, the communication station having its transmitter's power controlled is referred to as the transmitting station **52** and the communication station receiving power controlled communications is referred to as the receiving station **50**. Since combined closed loop/open loop power control may be used for uplink, downlink or both types of communications, the transmitter having its power controlled may be located at a base station $\mathbf{30}_1$, UE $\mathbf{32}_1$ or both. Accordingly, if both uplink and downlink power control are used, the receiving and transmitting station's components are located at both the base station $\mathbf{30}_1$ and UE $\mathbf{32}_1$.

The receiving station **50** receives various radio frequency signals including communications from the transmitting station **52** using an antenna **56**, or alternately, an antenna array. The received signals are passed through an isolator **60** to a demodulator **68** to produce a baseband signal. The baseband signal is processed, such as by a channel estimation device **96** and a data estimation device **98**, in the time slots and with the appropriate codes assigned to the transmitting station's communication. The channel estimation device **96** commonly uses the training sequence component in the baseband signal to provide channel information, such as channel impulse responses. The channel information is used by the data estimation device **98**, the interference measurement device **90**, the signal power measurement device **92** and the transmit power calculation device **94**. The data estimation device **98** recovers data from the channel by estimating soft symbols using the channel information. Using the soft symbols and channel information, the transmit power calculation device **94** controls the receiving station's transmission power level by controlling the gain of an amplifier **76**.

The signal power measurement device **92** uses either the soft symbols or the channel information, or both, to determine the received signal power of the communication in decibels (dB). The interference measurement device **90** determines the interference level in dB, I_{RS}, within the channel, based on either the channel information, or the soft symbols generated by the data estimation device **102**, or both.

The closed loop power command generator **88** uses the measured communication's received power level and the interference level, I_{RS}, to determine the Signal to Interference Ratio (SIR) of the received communication. Based on a comparison of the determined SIR with a target SIR (SIR_{TARGET}), a closed loop power command is generated, b_{TPC}, such as a power command bit, b_{TPC}, **step 38**. Alternately, the power command may be based on any quality measurement of the received signal.

For use in estimating the path loss between the receiving and transmitting stations **50, 52** and sending data, the receiving station **50** sends a communication to the transmitting station **58, step 40**. The communication may be sent on any one of various channels. Typically, in a TDD system, the channels used for estimating path loss are referred to as reference channels, although other channels may be used. If the receiving station **50** is a base station **30_1**, the communication is preferably sent over a downlink common channel or a common control physical channel (CCPCH).

Data to be communicated to the transmitting station **52** over the reference channel is referred to as reference channel data. The reference data may include, as shown, the interference level, I_{RS}, multiplexed with other reference data, such as the transmission power level of the reference channel, T_{RS}. The interference level, I_{RS}, and reference channel power level, T_{RS}, may be sent in other channels, such as a signaling channel, **step 40**. The closed loop power control command, b_{TPC}, is typically sent in a dedicated channel, dedicated to the communication between the receiving station **50** and transmitting station **52**.

The reference channel data is generated by a reference channel data generator **86**. The reference data is assigned one or multiple resource units based on the communication's bandwidth requirements. A spreading and training sequence insertion device **82** spreads the reference channel data and makes the spread reference data time-multiplexed with a training sequence in the appropriate time slots and codes of the assigned resource units. The resulting sequence is referred to as a communication burst. The communication burst is subsequently amplified by an amplifier **78**. The amplified communication burst may be summed by a sum device **72** with any other communication burst created through devices, such as a data generator **84**, spreading and training sequence insertion device **80** and amplifier **76**.

The summed communication bursts are modulated by a modulator **64**. The modulated signal is passed through an isolator **60** and radiated by an antenna **56** as shown or, alternately, through an antenna array. The radiated signal is passed through a wireless radio channel **54** to an antenna **58** of the transmitting station **52**.

The type of modulation used for the transmitted communication can be any of the those known to those skilled in the art, such as direct phase shift keying (DPSK) or quadrature phase shift keying (QPSK).

The antenna **58** or, alternately, antenna array of the transmitting station **52** receives various radio frequency signals. The received signals are passed through an isolator **62** to a demodulator **66** to produce a baseband signal. The baseband signal is processed, such as by a channel estimation device **100** and a data estimation device **102**, in the time slots and with the appropriate codes assigned to the communication burst of the receiving station **50**. The channel estimation device **100** commonly uses the training sequence component in the baseband signal to provide channel information, such as channel impulse responses. The channel information is used by the data estimation device **102** and a power measurement device **110**.

The power level of the processed communication corresponding to the reference channel, R_{TS}, is measured by the power measurement device **110** and sent to a pathloss estimation device **112, step 42**. Both the channel estimation device **100** and the data estimation device **102** are capable of separating the reference channel from all other channels. If an automatic gain control device or amplifier is used for processing the received signals, the measured power level is adjusted to correct for the gain of these devices at either the power measurement device **110** or the pathloss estimation device **112**. The power measurement device **110** is a component of the combined closed loop/open loop controller **108**. As illustrated in **Figure 4**, the combined closed loop/open loop power controller **108** consists of the power measurement device **110**, pathloss estimation device **112**, quality measurement device **114**, and transmit power calculation device **116**.

To determine the path loss, L, the transmitting station **52** also requires the communication's transmitted power level, T_{RS}. The transmitted power level, T_{RS}, may be sent along with the communication's data or in a signaling channel. If the power level, T_{RS}, is sent along with the communication's data, the data estimation device **102** interprets the power level and sends the interpreted power level to the pathloss estimation device **112**. If the receiving station **50** is a base station **30_1**, preferably the transmitted power level, T_{RS}, is sent via the broadcast channel (BCH) from the base station **30_1**. By subtracting the received communication's power level, R_{TS} in dB, from the sent communication's transmitted power level, T_{RS} in dB, the pathloss estimation device **112** estimates the path loss, L, between the two stations **50**, **52**, **step 42**. In certain situations, instead of transmitting the transmitted power level, T_{RS}, the receiving station **50** may transmit a reference for the transmitted power level. In that case, the pathloss estimation device **112** provides reference levels for the path loss, L.

If a time delay exists between the estimated path loss and the transmitted communication, the path loss experienced by the transmitted communication may differ from the calculated loss. In TDD systems where communications are sent in differing time slots **36_1-36_n**, the time slot delay between received and transmitted communications may degrade the performance of an open loop power control system. Combined closed loop/open loop power control utilizes both closed loop and open loop power control aspects. If the quality of the path loss measurement is high, the system primarily acts as an open loop system. If the quality of the path loss measurement is low, the system primarily acts as a closed loop system. To combine the two power control aspects, the system weights the open loop aspect based on the quality of the path loss measurement.

A quality measurement device **114** in a weighted open loop power controller **108** determines the quality of the estimated path loss, **step 46**. The quality may be determined using the channel information generated by the channel estimation device **100**, the soft symbols generated by the data estimation device **102** or other quality measurement techniques. The estimated path loss quality is used to weight the path loss estimate by the transmit power calculation device **116**. If the power command, b_{TPC}, was sent in the communication's data, the data estimation device **102** interprets the closed loop power command, b_{TPC}. Using the closed loop power command, b_{TPC}, and the weighted path loss, the transmit power calculation device **116** sets the transmit power level of the receiving station **50**, **step 48**.

The following is one of the preferred combined closed loop/open loop power control algorithms. The transmitting station's power level in decibels, P_{TS}, is determined using **Equations 4** and **6**.

$$P_{TS} = P_0 + G(n) + \alpha L \qquad \textbf{Equation 4}$$

P_0 is the power level that the receiving station **50** desires to receive the transmitting station's communication in dB. P_0 is determined by the desired SIR at the receiving station **50**, SIR_{TARGET}, and the interference level, I_{RS}, at the receiving station **50** using **Equation 5**.

$$P_0 = SIR_{TARGET} + I_{RS} \qquad \textbf{Equation 5}$$

I_{RS} is either signaled or broadcasted from the receiving station **50** to the transmitting station **52**. For downlink power control, SIR_{TARGET} is known at the transmitting station **52**. For uplink power control, SIR_{TARGET} is signaled from the receiving station **50** to the transmitting station **52**. G(n) is the closed loop power control factor. **Equation 6** is one equation for determining G(n).

$$G(n) = G(n-1) + b_{TPC}\,\Delta_{TPC} \qquad \textbf{Equation 6}$$

G(n-1) is the previous closed loop power control factor. The power command, b_{TPC}, for use in **Equation 6** is either +1 or -1. One technique for determining the power command, b_{TPC}, is **Equation 3**. The power command, b_{TPC}, is typically updated at a rate of 100 ms in a TDD system, although other update rates may be used. Δ_{TPC} is the change in power level. The change in power level is typically 1 dB although other values may be used. As a result, the closed loop factor increases by 1 dB if b_{TPC} is +1 and decreases by 1 dB if b_{TPC} is -1.

The weighting value, α, is determined by the quality measurement device **114**. α is a measure of the quality of the estimated path loss and is, preferably, based on the number of time slots, D, between the time slot of the last path loss estimate and the first time slot of the communication transmitted by the transmitting station **52**. The value of α is from zero to one. Generally, if the time difference, D, between the time slots is small, the recent path loss estimate will be fairly accurate and α is set at a value close to one. By contrast, if the time difference is large, the path loss estimate may not be accurate and the closed loop aspect is most likely more accurate. Accordingly, α is set at a value closer to zero.

Equation 7 is one equation for determining α, although others may be used.

$$\alpha = 1 - (D - 1)/D_{max} \qquad \textbf{Equation 7}$$

D_{max} is the maximum possible delay. A typical value for a frame having fifteen time slots is six. If the delay is D_{max} or greater, α approaches zero. Using the calculated transmit power level, P_{TS}, determined by a transmit power calculation device **116**, the combined closed loop/open loop power controller **108** sets the transmit power of the transmitted communication.

Data to be transmitted in a communication from the transmitting station **52** is produced by a data generator **106**. The communication data is spread and time-multiplexed with a training sequence by the spreading and training sequence insertion device **104** in the appropriate time slots and codes of the assigned resource units producing a communication burst. The spread signal is amplified by the amplifier **74** and modulated by the modulator **70** to radio frequency.

The combined closed loop/open loop power controller **108** controls the gain of the amplifier **74** to achieve the determined transmit power level, P_{TS}, for the communication. The power controlled communication is passed through the isolator **62** and radiated by the antenna **58**.

Equations 8 and **9** are another preferred combined closed loop/open loop power control algorithm.

$$P_{TS} = P_0 + K(n) \qquad \textbf{Equation 8}$$

$$K(n) = K(n-1) + b_{TPC}\,\Delta_{TPC} + \alpha L \qquad \textbf{Equation 9}$$

K(n) is the combined closed loop/open loop factor. As shown, this factor includes both the closed loop and open loop power control aspects. **Equations 4** and **5** segregate the two aspects.

Although the two above algorithms only weighted the open loop factor, the weighting may be applied to the closed loop factor or both the open and closed loop factors. Under certain conditions, the network operator may desire to use solely open loop or solely closed loop power control. For example, the operator may use solely closed loop power control by setting α to zero.

Figures 5-10 depict graphs **118-128** illustrating the performance of a combined closed-loop/open-loop power control system. These graphs **118-128** depict the results of simulations comparing the performance of the ARIB proposed system, a closed loop, a combined open loop/closed loop system using **Equations 4** and **6** (scheme I) and a combined system using **Equations 8** and **9** (scheme II). The simulations were performed at the symbol rate. A spreading factor of sixteen was used for both the uplink and downlink channels. The uplink and downlink channels are International Telecommunication Union (ITU) Channel model [ITU-R M.1225, vehicular, type B]. Additive noises were simulated as being independent of white Gaussian noises with unity variance. The path loss is estimated at the transmitting station **52** which is a UE **32_1** and in particular a mobile station. The BCH channel was used for the path loss estimate. The path loss was estimated two times per frame at a rate of 200 cycles per second. The receiving station **50**, which was a base station 30_1, sent the BCH transmission power level over the BCH. RAKE combining was used for both the UE 32_1 and base station 30_1. Antenna diversity combining was used at the base station 30_1.

Graphs **118, 122, 126** depict the standard deviation of the received signal to noise ratio (SNR) at the base station 30_1 of the UE's power controlled communication as a function of the time slot delay, D. Graphs **120, 124, 128** depict the normalized bias of the received SNR as a function of the delay, D. The normalization was performed with respect to the desired SNR. Each point in the graphs **118-128** represents the average of 3000 Monte-Carlo runs.

Graphs **118, 120** depict the results for an α set at one. For low time slot delays ($D<4$), scheme I and II outperform closed loop power control. For larger delays ($D\geq4$), closed loop outperforms both scheme I and II which demonstrates the importance of weighting the open loop and closed loop aspects.

Graphs **122, 124** depict the results for an α set at 0.5. As shown, for all delays excluding the maximum, schemes I and II outperform closed loop power control. The ARIB proposal only outperforms the others at the lowest delay ($D=1$).

Graphs **126, 128** depict the results for an α set using **Equation 7** with D_{max} equal to six. As shown, schemes I and II outperform both closed loop and the ARIB proposal at all delays, D.

CLAIMS

1. A method for controlling transmission power levels in a spread spectrum time division duplex communication system having frames with time slots for communication, the method comprising:

receiving at a first communication station communications from a second communication station and transmitting from the first station power commands based on in part a reception quality of the received communications;

transmitting from the first communication station a first communication having a transmission power level in a first time slot;

receiving at the second communication station the first communication and the power commands;

measuring a power level of the first communication as received;

determining a pathloss estimate based on in part the measured received first communication power level and the first communication transmission power level; and

setting a transmission power level for a second communication in a second time slot from the second station to the first station based on in part the pathloss estimate weighted by a quality factor and the power commands, wherein the quality factor is a function of a time separation of the first and second time slots.

2. The method of claim 1 further comprising:

determining a quality, α, of the pathloss estimate based on in part a number of time slots, D, between the first and second time slot; and

wherein the quality factor is α.

3. The method of claim 1 wherein a maximum time slot delay is D_{max} and the determined quality, α, is determined by

$\alpha = 1 - (D-1) / D_{max}$.

4. The method of claim 1 wherein the set transmission power level is based on in part a desired received power level at the first station, a closed loop factor and an open loop factor; wherein the closed loop factor is based on in part the received power commands and the open loop factor is based on in part the pathloss estimate weighted by the quality factor.

5. The method of claim 1 wherein the set transmission power level is based on in part a desired received power level at the first station and a combined closed loop/open loop factor; wherein the combined closed loop/open loop factor is based on in part the received power commands and the pathloss estimate weighted by the quality factor.

6. The method of claim 4 wherein the closed loop factor is updated for each received power command.

7. The method of claim 5 wherein the combined factor is updated for each received power command.

8. The method of claim 4 wherein the desired received power level is based on in part a target signal to interference ratio and a measured interference level at the first station.

9. The method of claim 5 wherein the desired received power level is based on in part a target signal to interference ratio and a measured interference level at the first station.

10. The method of claim 1 wherein the first station is a base station and the second station is a user equipment.

11. The method of claim 1 wherein the first station is a user equipment and the second station is a base station.

12. A spread spectrum time division duplex communication system having a first and second communication station, the system using frames with time slots for communication, the system comprising:

the first station comprising:

means for receiving communications from the second communication station and transmitting power commands based on in part a reception quality of the received communications; and

means for transmitting a first communication having a transmission power level in a first time slot; and

the second station comprising:

means for receiving the first communication and the power commands;

means for measuring a power level of the first communication as received;

means for determining a pathloss estimate based on in part the measured received first communication power level and the first communication transmission power level; and

means for setting a transmission power level for a second communication in a second time slot from the second station to the first station based on in part the pathloss estimate weighted by a quality factor and the power commands, wherein the quality factor is a function of a time separation of the first and second time slots.

13. The system of claim 12 wherein:

the second station further comprises means for determining a quality, α, of the pathloss estimate based on in part a number of time slots, D, between the first and second time slot; and

the quality factor is α.

14. The system of claim 12 wherein a maximum time slot delay is D_{max} and the determined quality, α, is determined by

$\alpha = 1 - (D-1) / D_{max}$.

15. The system of claim 1 wherein the setting means sets the transmission power level based on in part a desired received power level at the first station, a closed loop factor and an open loop factor, the closed loop factor is based on in part the received power commands and the open loop factor is based on in part the pathloss estimate weighted by the quality factor.

16. The system of claim 1 wherein the setting means sets the transmission power level based on in part a desired received power level at the first station and a combined closed loop/open loop factor, the combined closed loop/open loop factor is based on in part the received power commands and the path loss estimate weighted by the quality factor.

17. The system of claim 15 wherein the closed loop factor is updated for each received power command.

18. The system of claim 16 wherein the combined factor is updated for each received power command.

19. The system of claim 15 wherein the desired received power level is based on in part a target signal to interference ratio and a measured interference level at the first station.

20. The system of claim 16 wherein the desired received power level is based on in part a target signal to interference ratio and a measured interference level at the first station.

21. The system of claim 12 wherein the first station is a base station and the second station is a user equipment.

22. The system of claim 12 wherein the first station is a user equipment and the second station is a base station.

23. A communication station having its transmission power level controlled in a spread spectrum time division duplex communication system, the system using frames with time slots for communication and having a second communication station transmitting a first communication in a first time slot and power commands, the communication station comprising:

at least one antenna for receiving the first communication and the power commands and transmitting an amplified second communication in a second time slot;

a channel estimation device having an input configured to receive the received first communication for producing channel information;

a data estimation device having inputs configured to receive the received first communication, the power commands and the channel information for producing soft symbols and recovering the power commands;

a power measurement device having an input configured to receive the channel information for producing a measurement of a received power level for producing a pathloss estimate for the first communication;

a quality measurement device for producing a quality measurement based at least in part upon a time separation of the first time slot and a second time slot;

a transmit power calculation device having inputs configured to receive the pathloss estimation, the recovered power commands and the quality measurement for producing a power control signal based on in part the pathloss estimate weighted by the quality measurement and the recovered power commands; and

an amplifier having inputs configured to receive the power control signal and a second communication to be transmitted in the second time slot for amplifying the second communication in response to the power control signal to produce the amplified second communication.

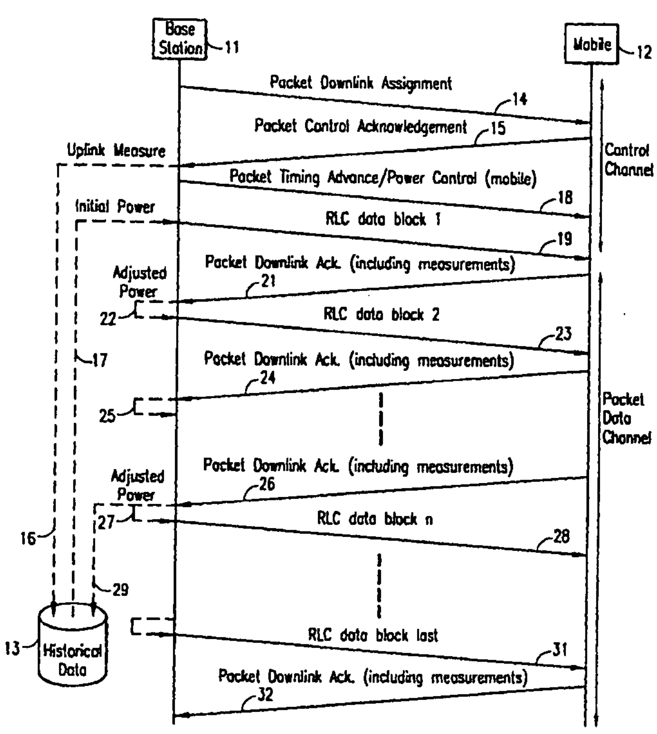
(54) Title: INITIAL UPLINK AND DOWNLINK POWER LEVEL ASSIGNMENT IN A RADIO TELECOMMUNICATIONS NETWORK



(57) Abstract: A method of assigning initial uplink and downlink power levels for a transaction of a data package between a mobile station (12) and a base station (11) in a radio telecommunications network. A historical database (13) of signal strength measurements, interference measurements, and uplink and downlink power level settings in the network is maintained. To set downlink power, an uplink signal strength (16) of an initial access signal (15) sent from the mobile station to the base station is measured at the base station. The measured uplink signal strength (16) is sent to the historical database where it is correlated with an associated downlink power level setting. The correlated downlink power level setting (17) is sent to the base station where it is utilized as the initial downlink power level setting for a first transmission (19) from the base station to the mobile station. To set uplink power, the signal strength (42) of an initial packet channel request (41) on the control channel is sent to the historical database along with an interference measurement (43) on the packet date channel. An associated mobile station uplink power level setting (44) is retrieved from the database and sent to the mobile station where it is utilized for the first data transmission (46). A closed loop power control method may be utilized to adjust either the uplink or the downlink power level to an optimum level.

INITIAL UPLINK AND DOWNLINK POWER LEVEL ASSIGNMENT IN A RADIO TELECOMMUNICATIONS NETWORK

BACKGROUND OF THE INVENTION

Technical Field of the Invention

This invention relates to telecommunication systems and, more particularly, to a method of setting initial uplink and downlink power levels in a mobile station and a radio base station in a radio telecommunications network.

Description of Related Art

U.S. Patent No. 4,696,027 to Bonta (Bonta) discloses a two-way radio system which employs power control of a mobile station to provide a predetermined received signal strength at a radio base station following a handoff. During the locating function, Bonta measures the uplink signal strength of signals transmitted by the mobile station to the target base station, and after accounting for path loss, etc., the post-handoff power level of the mobile station is determined. Thus, the methodology utilized in Bonta is applicable to the uplink power level when a call is ongoing and there has been plenty of opportunity to make signal strength measurements for use in analyzing what mobile station power level is required in the target cell. However, Bonta does not teach or suggest a method of setting an initial uplink (mobile station to base station) or downlink (base station to mobile station) power level at times such as system access when multiple signal strength measurements have not been made.

In some existing Time Division Multiple Access (TDMA) radio telecommunications networks, a Base-Station Power Control (BSPC) function sets the initial downlink power level to its highest level when a mobile station first accesses the network and a call is being set up on a digital traffic channel. After uplink and downlink signal strength measurements have been reported, the BSPC function adjusts the downlink power level to a more optimum level. In most cases, this process ensures adequate downlink signal strength for call setup, but causes unnecessary peaks of energy in the downlink with a resultant increase in the interference level in the network. Therefore, some calls in co-channel cells may experience degraded radio quality performance, or may even be disconnected.

In other existing radio telecommunications networks such as wideband Code Division Multiple Access (CDMA) systems, the initial downlink power level is set at its lowest level, and is then incrementally increased until the mobile station can receive it. After the initial downlink signal is sent to the mobile station, the system must wait for an acknowledgment from the MS. If an acknowledgment is not received, the downlink power is increased, and the signal is sent again. This process may be repeated several times before an acknowledgment is received from the mobile station. Thus, this approach reduces interference levels in the network, but requires additional time for call setup.

In order to overcome the disadvantage of existing solutions, it would be advantageous to have a method of assigning more optimum initial uplink and downlink power levels at system access on the control channel (for a circuit-switched call) or at acknowledgment on the packet channel (for a packet-switched call). Such a method would also provide a more efficient way to optimize initial power settings following handoff or at the beginning of a data transaction during an ongoing call. The present invention provides such a method.

SUMMARY OF THE INVENTION

In one aspect, the present invention is a method of assigning an initial downlink power level from a base station to a mobile station. The method assigns the initial downlink power level based on historical data. Rather than calculating the power level directly from signal strength measurements taken after the call has begun, the invention builds a historical database of signal strength measurements and path loss offsets in the system. These path loss offsets are then correlated with the downlink power used by the power control algorithm in the base station, and a statistical relationship between the two is determined. When it is time to assign the initial downlink power, the uplink signal strength is measured, and then the downlink power corresponding to that measured signal strength is assigned. The method may be applied at initial system access or at intercell handoff, and is applicable to both circuit-switched calls and packet-switched data transactions.

In particular, the method of the present invention maintains a historical database of signal strength measurements and downlink power level settings in the telecommunication system. The uplink signal strength of an initial signal sent from the mobile station to the base station is measured at the base station. The measured uplink signal strength is sent to the historical database where it is correlated with an associated downlink power level setting. The correlated downlink power level setting is sent to the base station where it is utilized as the initial downlink power level setting for a first transmission from the base station to the mobile station. A closed loop power control method may then be used to adjust the downlink power level to achieve an optimum received signal strength at the mobile station. After the initial phase of the closed loop method, the historical database is updated by sending the adjusted downlink power level to the historical database, and associating the adjusted downlink power level setting with the uplink signal strength of the initial signal sent from the mobile station to the base station.

In another aspect, the present invention is a method of assigning an initial downlink power level at intercell handoff between a target base station and a mobile station in a radio telecommunication system. The method includes the steps of building a historical database which correlates measurements of radio quality parameters with downlink power level settings, measuring at the target base station a radio quality parameter from an initial signal sent from the mobile station to the target base station, and sending the measured radio quality parameter to the historical database. The method also includes correlating in the historical database the measured radio quality parameter with an associated downlink power level setting, sending the correlated downlink power level setting to the target base station, and utilizing the correlated downlink power level setting as the initial downlink power level setting for a first transmission from the target base station to the mobile station.

In yet another aspect, the present invention is method of assigning an initial uplink power level from a mobile station to a base station in a radio telecommunication system. The method includes building a historical database which correlates measurements of radio quality parameters such as signal strength and interference measurements with uplink mobile station power level settings. The radio quality parameters are then measured at the base station. For example, the method may measure a signal strength of an initial access signal sent from the mobile station to the base station, assign a packet data channel to the mobile station, and then measure an interference level on the assigned packet data channel. This is followed by sending the measured parameters to the historical database, correlating the measured parameters with an optimum uplink mobile station power level setting, sending the correlated optimum uplink mobile station power level setting to the mobile station, and utilizing the correlated optimum uplink power level setting as the initial mobile station power level setting for a first data transmission from the mobile station to the base station.

BRIEF DESCRIPTION OF THE DRAWINGS

The invention will be better understood and its numerous objects and advantages will become more apparent to those skilled in the art by reference to the following drawing, in conjunction with the accompanying specification, in which:

FIG. 1 is a signal flow diagram illustrating how the method of the present invention is utilized with the General Packet Radio Service (GPRS) and the Global System for Mobile Communications (GSM) to determine an initial downlink power level and to maintain the historical database;

FIG. 2 is a signal flow diagram illustrating how the method of the present invention is utilized with GPRS and GSM to determine an initial uplink power level and to maintain the historical database; and

FIG. 3 is an exemplary data structure for the historical database.

DETAILED DESCRIPTION OF EMBODIMENTS

The present invention is a method of assigning initial uplink and downlink power levels at times such as system access when multiple signal strength measurements between a mobile station and a base station have not been made. The invention assigns the initial power levels based on historical data. Rather than calculating a power level directly from signal strength measurements taken after the call has begun, the invention builds a historical database of signal strength measurements and path loss offsets in the system. These path loss offsets are then correlated, for example, with the downlink power used by the power control algorithm in the base station, and a statistical relationship between the two is determined. When it is time to assign the initial downlink power, the uplink path loss is estimated, and then the downlink power corresponding to that path loss is assigned.

In a typical scenario in which initial downlink power is to be determined, a speech cell exists, and it is desired to begin the access at a near-optimum power level. The system may know only a single uplink signal strength measurement. The needed downlink power must be calculated from that single uplink measurement. A classical approach is to establish some fixed offset. To do so, however, the system must calculate path losses using a number of varying parameters which are not known. In addition, the uplink control signaling may be of very short duration, resulting in an unreliable measurement. Also, if interference is present, signal strength is not a good measure of radio quality.

Alternatively, if the cell is programmed to learn its environment, historical uplink and downlink path loss information can be stored as historical data. This historical data can then be associated with uplink signal strength measurements. Then, when a mobile station accesses the network, its uplink signal strength is measured, and the system can select a near-optimum initial uplink or downlink power level. A historical database may be built for each cell, transceiver, or mobile station type, depending on the level of accuracy desired. The database may also be built for each mobile individual or data transaction. This method can be applied to system access as well as handoff and data packet transfer.

The present invention is useful for assigning initial power level in a variety of networks, and is particularly useful for packet data applications. For packet data being transmitted from the base station to the mobile station, the system may assign the initial downlink power based only on an uplink packet control acknowledgment. This saves additional signaling now utilized by the BSPC function. For packet data being transmitted from the mobile station to the base station, the system may assign an initial uplink power based on the signal strength of the packet channel request signal which the mobile station sends on the control channel, and an interference measurement on the assigned packet data channel. The historical database correlates these measurements with an optimum initial mobile station power level for the data transmission.

In many cases, it is more important to make an accurate determination of the initial power level in packet data transmissions because packet data transmissions may be of shorter duration than typical circuit-switched voice calls. Thus, the period of time utilized by existing BSPC functions to determine an optimum uplink or downlink power level may equate to a large percentage of the total transmission. For example, in a speech call, at least 20-30 seconds may be spent in one cell, and the interference caused by the initial peak transmitter power lasts for only 1 or 2 seconds of that period. A packet transmission may only last a few seconds, and therefore using existing techniques, a larger percentage of the call may be utilized trying to find a good power level.

Other methods may also be used for initial power level assignment for packet data transactions. For example, a certain mobile station may have conducted a recent packet data transaction, and by retaining signal strength and power level information, the system can better estimate the initial power level required in a later transaction. During a packet data call, the mobile station requests packets or acknowledges packets on the uplink signal channel. These requests or acknowledgments may be very short bursts. The signal strength of these requests or acknowledgments is measured, and a relationship is then built between the signal strength measurements and the power that is currently being used to eventually derive an optimum power level for packet transmission.

Several radio quality parameters may be measured and stored in the historical database for later correlation. Then, at a later system access, pairs of parameters, or combinations of additional parameters may be utilized to determine a most likely best initial power level. Examples of available radio quality measurements that can be utilized for the historical database are:

- Signal strength of control signaling during access;
- Signal strength on the idle traffic channel, indicating interference;
- Energy-per-bit/Noise (Eb/No) or Carrier-to-Interference (C/I)

measurements;

• Bit errors, indicating radio quality (Eb/No or C/I); and

• Cell-load or sum of used power in a CDMA system, indicating interference.

Since uplink and downlink offsets are measured and compensated for, either uplink or downlink measurements can be used and correlated with the desired power. Therefore, uplink measurements can be utilized to set initial downlink power.

As noted above, the historical database can be built for each cell, transceiver, mobile station type, mobile individual, or data transaction. The database may be built on a per-cell basis to adapt to each cell radio environment, to measurement devices inaccuracy, and to the uplink/downlink link budget difference. The database may be built on a per-transceiver basis to adapt to equipment differences and to channel reuse/interference differences between channels. The database may be built on the basis of mobile station type in order to adapt to different mobile station design characteristics. The database may be built on a per-mobile individual basis to adapt to each mobile station. The database may be built on a per-data transaction basis to retain and reuse data gathered about a particular radio environment during a packet data association.

FIG. 1 is a signal flow diagram illustrating how the method of the present invention is utilized with the General Packet Radio Service (GPRS) and the Global System for Mobile Communications (GSM) to determine an initial downlink power level and to maintain the historical database. Illustrated in the figure are a base station 11, a mobile station 12, and a historical database 13 which stores signal strength measurements, path loss offsets, and associated power level settings in the network. The signal flow illustrates a Temporary Block Flow (TBF) process in which one data packet is sent downlink using GPRS. The data packet has been split into a number of Radio Link Control (RLC) blocks, each of which is four GSM bursts. This equates to between 22 and 54 bytes payload depending on channel coding.

When it is desired to transmit a packet to the mobile station 12, the base station 11 assigns a packet data channel and notifies the mobile station with a Packet Downlink Assignment signal 14 on the control channel. Upon receipt of this signal, the mobile station sends a Packet Control Acknowledgment 15 as a response. The uplink signal strength of this acknowledgment is measured by the base station, and at 16, the measurement is passed to the historical database 13. The database utilizes the measured uplink signal strength and associated historical path loss offsets to select a near-optimum initial power level setting. At 17, the initial power level setting is returned to the base station. Meanwhile, the base station has sent a Packet Timing Advance/Power Control signal 18 to the mobile station on the control channel. The mobile station is then switched to the assigned packet data channel.

The first RLC data block 19 is then sent from the base station 11 to the mobile station 12 with the initial power based on the selected initial power level setting from the historical database 13. The mobile station receives the first RLC data block and measures the downlink signal strength and C/I. The mobile station then sends a Packet Downlink Acknowledgment signal 21 to the base station and includes the downlink measurement results. At 22, the base station filters the received downlink measurements, and uses a closed loop power control process to adjust the power level of the second RLC data block based on the received downlink measurements. The adjusted power level is calculated to result in a more optimum received signal strength at the mobile station. At 23, the second RLC data block is then sent from the base station to the mobile station at the adjusted power level. Once again, the mobile station receives the RLC data block and measures the downlink signal strength and C/I. The mobile station then sends a second Packet Downlink Acknowledgment signal 24 to the base station and includes the downlink measurements from the second RLC data block. At 25, the base station again adjusts the power level of the transmitted RLC data blocks based on the received downlink measurements.

This process continues until the closed loop power control has passed its initial phase, which is dependent on filter times. This is shown in FIG. 1 after "n" iterations where the mobile station 12 sends a Packet Downlink Acknowledgment signal 26 to the base station and includes the downlink measurement results from the n-1th RLC data block. At 27, the base station adjusts the power level of the nth RLC data block based on the received downlink measurements, and sends the data block to the mobile station at 28. At 29, the base station also passes the adjusted power level setting to the historical database 13 which stores this value along with the uplink measurement recorded at step 16. This can be done with filters, a look-up table, or any other suitable method. As noted above, the value may be associated with one parameter or with others on a per-cell, per-data transfer, etc. basis.

The closed loop power control function may then continue until the last RLC data block is transmitted at 31, and the last Packet Downlink Acknowledgment signal 32 is sent to the base station with downlink signal strength and C/I measurements.

FIG. 2 is a signal flow diagram illustrating how the method of the present invention is utilized with GPRS and GSM to determine an initial uplink power level and to maintain the historical database. When it is desired to transmit a packet from the mobile station 12, the mobile station sends a Packet Channel Request signal 41 on the control channel to the base station 11. The base station measures the uplink signal strength of the signal and sends a signal strength measurement 42 to the historical database 13. The base station also assigns a packet data channel to the mobile station and measures the idle signal strength on the assigned channel as an interference measurement 43 which is also sent to the historical database. Alternatively, the interference may be continuously measured on all packet data channels and recorded in the historical database so that the information is readily available and does not delay allocation when requested.

The combination of signal strength of the Packet Channel Request signal 41 and interference on the assigned packet data channel 43 is then used in the historical database to look up an optimum initial mobile uplink power setting 44. The base station then sends a Packet Uplink Assignment signal 45 to the mobile station and includes the initial mobile uplink power setting.

Upon receipt of the Packet Uplink Assignment signal 45, the mobile station 12 sends a first RLC data block 46 to the base station 11 utilizing the initial mobile uplink power setting 44 from the historical database 13. The base station receives the first RLC data block, analyzes the quality of the received block, and uses a closed loop power control process at 47 to compute an adjusted uplink power setting for the mobile station. The adjusted uplink power setting is sent to the mobile station in a Packet Uplink Acknowledgment signal 48. The mobile station then uses the adjusted uplink power setting to send the second RLC data block 49.

Once again, the base station receives the RLC data block (in this case RLC data block 2), analyzes the quality of the received block, and uses a closed loop power control process at 51 to compute an adjusted uplink power setting for the mobile station. The adjusted uplink power setting is sent to the mobile station in a Packet Uplink Acknowledgment signal 52.

This process continues until the closed loop power control has passed its initial phase, which is dependent on filter times. This is shown in FIG. 2 after "n" iterations where the mobile station 12 sends the nth RLC data block 53 to the base station 11. At 54, the base station computes an adjusted uplink power setting for the mobile station, and sends a Packet Uplink Acknowledgment signal 55 to the mobile station with the adjusted power level setting. At 56, the base station also passes the adjusted power level setting to the historical database 13 which stores this value along with the uplink signal strength measurement 42 and the uplink interference measurement 43 previously recorded. This can be done with filters, a look-up table, or any other suitable method.

The closed loop power control function may then continue until the last RLC data block 57 is transmitted from the mobile station 12, and the last Packet Uplink Acknowledgment signal 58 is sent from the base station 11.

FIG. 3 is an exemplary data structure for the historical database 13 in which the database is built for each cell 61. As noted above, the historical database may be built for each cell, transceiver, or mobile station type, depending on the level of accuracy desired. The database may also be built for each mobile individual or data transaction. Essentially, a database can be built for each entity which has individual behavior for initial data, and for which enough data can be collected. In each database, a probability density function (PDF) is built for each combination of measurement values. In this example, the combination of signal strength measurements 62 and interference measurements 63 results in a PDF 64 for each combination 65. The values can be rounded and truncated to limit the size of the database.

The PDF may be programmed in several ways to identify a power level setting associated with the signal strength/interference combination. For example, the PDF may identify the most common resulting adjusted power level computed by the closed loop power control function and reported to the historical database. Alternatively, the PDF may identify a median value rather than the most common power level setting.

It is thus believed that the operation and construction of the present invention will be apparent from the foregoing description. While the method shown and described has been characterized as being preferred, it will be readily apparent that various changes and modifications could be made therein without departing from the scope of the invention as defined in the following claims.

WHAT IS CLAIMED IS:

1. A method of assigning an initial downlink power level from a base station to a mobile station in a radio telecommunication system, comprising the steps of:

building a historical database which correlates measurements of radio quality parameters with downlink power level settings;

measuring at the base station, a radio quality parameter from an initial signal sent from the mobile station to the base station;

sending the measured radio quality parameter to the historical database;

correlating in the historical database, the measured radio quality parameter with an associated downlink power level setting;

sending the correlated downlink power level setting to the base station; and

utilizing the correlated downlink power level setting as the initial downlink power level setting for a first transmission from the base station to the mobile station.

2. The method of assigning an initial downlink power level of claim 1 wherein the step of building a historical database includes building a historical database in which measurements are grouped for each transceiver in the base station.

3. The method of assigning an initial downlink power level of claim 1 wherein the step of building a historical database includes building a historical database in which measurements are grouped for each cell in the system.

4. The method of assigning an initial downlink power level of claim 1 wherein the step of building a historical database includes building a historical database in which measurements are grouped for each mobile station type operating in the system

5. The method of assigning an initial downlink power level of claim 1 wherein the step of building a historical database includes building a historical

database in which measurements are grouped for each mobile individual in the system.

6. The method of assigning an initial downlink power level of claim 1 wherein the step of building a historical database includes building a historical database in which measurements are grouped for each data transaction conducted in the system.

7. The method of assigning an initial downlink power level of claim 1 wherein the measured radio quality parameter is selected from a group consisting of:

an uplink signal strength of an initial access signal sent from the mobile station to the base station;

signal strength of control signaling during access;

signal strength on an idle traffic channel;

Energy-per-bit/Noise (Eb/No) measurements;

Carrier-to-Interference (C/I) ratio measurements;

bit errors;

cell-load in the system; and

sum of used power in the system.

8. The method of assigning an initial downlink power level of claim 1 further comprising a closed loop power control step, the closed loop step including:

measuring at the mobile station, at least one radio quality parameter of a transmission from the base station;

sending the measured radio quality parameter from the mobile station to the base station; and

adjusting the downlink power level at the base station to a more optimum level.

9. The method of assigning an initial downlink power level of claim 8 further comprising the step of updating the historical database, the updating step including:

sending the adjusted downlink power level to the historical database; and

associating the adjusted downlink power level setting with the uplink signal strength of the initial signal sent from the mobile station to the base station.

10. The method of assigning an initial downlink power level of claim 9 wherein the updating step is performed after a number of iterations in which the received radio quality parameter is measured at the mobile station, the received radio quality measurements are reported to the base station, and the downlink power level is adjusted to a more optimum level.

11. The method of assigning an initial downlink power level of claim 10 wherein the number of iterations is determined when the closed loop power control step has passed its initial phase, as determined by filter times.

12. The method of assigning an initial downlink power level of claim 1 wherein the step of measuring at the base station, a radio quality parameter from an initial signal sent from the mobile station to the base station includes measuring the signal strength of control signaling at initial system access on a control channel for a circuit-switched call.

13. The method of assigning an initial downlink power level of claim 1 wherein the initial downlink power level is being set at intercell handoff of the mobile station from a serving base station to a target base station, and the step of measuring at the base station, a radio quality parameter from an initial signal sent from the mobile station to the base station includes measuring at the target base station, a radio quality parameter from an initial signal sent from the mobile station to the target base station.

14. The method of assigning an initial downlink power level of claim 1 wherein the initial downlink power level is being set for a transaction of a data package between the base station and the mobile station, and the step of building a historical database includes storing in the historical database, measurements of radio quality parameters and power level information from previous data package transactions between the base station and the mobile station.

15. The method of assigning an initial downlink power level of claim 14 wherein the step of measuring at the base station, a radio quality parameter from an initial signal sent from the mobile station to the base station includes measuring the signal strength of control signaling at packet control acknowledgment on a packet channel.

16. A method of assigning an initial downlink power level from a base station to a mobile station in a radio telecommunication system, comprising the steps of:

building a historical database which correlates measurements of radio quality parameters with downlink power level settings;

measuring at the mobile station, a radio quality parameter from an initial signal sent from the base station to the mobile station;

sending the measured radio quality parameter to the historical database;

correlating in the historical database, the measured radio quality parameter with an associated downlink power level setting;

sending the correlated downlink power level setting to the base station; and

utilizing the correlated downlink power level setting as the initial downlink power level setting for a first transmission from the base station to the mobile station.

17. The method of assigning an initial downlink power level of claim 16 wherein the measured radio quality parameter is selected from a group consisting of:

an uplink signal strength of an initial access signal sent from the mobile station to the base station;

signal strength of control signaling during access;

signal strength on an idle traffic channel;

Energy-per-bit/Noise (Eb/No) measurements;

Carrier-to-Interference (C/I) ratio measurements; and

bit errors.

18. The method of assigning an initial downlink power level of claim 16

wherein the step of measuring at the mobile station, a radio quality parameter from an initial signal sent from the base station to the mobile station includes measuring the signal strength of control signaling at initial system access on a control channel for a circuit-switched call.

19. The method of assigning an initial downlink power level of claim 16 wherein the initial downlink power level is being set at intercell handoff of the mobile station from a serving base station to a target base station, and the step of measuring at the mobile station, a radio quality parameter from an initial signal sent from the base station to the mobile station includes measuring at the mobile station, a radio quality parameter from an initial signal sent from the target base station to the mobile station.

20. The method of assigning an initial downlink power level of claim 16 wherein the initial downlink power level is being set for a transaction of a data package between the base station and the mobile station, and the step of building a historical database includes storing in the historical database, measurements of radio quality parameters and power level information from previous data package transactions between the base station and the mobile station.

21. A method of assigning an initial uplink power level from a mobile station to a base station in a radio telecommunication system, comprising the steps of:

building a historical database which correlates measurements of radio quality parameters with optimum uplink mobile station power level settings;

measuring at the base station, at least one radio quality parameter from signals sent from the mobile station to the base station;

sending the measured radio quality parameter to the historical database;

correlating in the historical database, the measured radio quality parameter with an optimum uplink mobile station power level setting;

sending the correlated optimum uplink power level setting to the mobile station; and

utilizing the correlated optimum uplink power level setting as the initial mobile station power level setting for a first transmission from the mobile station to the base station.

22. The method of assigning an initial uplink power level of claim 21 wherein the measured radio quality parameter is selected from a group consisting of:

an uplink signal strength of an initial access signal sent from the mobile station to the base station;

signal strength of control signaling during access;

signal strength on an idle traffic channel;

Energy-per-bit/Noise (Eb/No) measurements;

Carrier-to-Interference (C/I) ratio measurements;

bit errors;

cell-load in the system; and

sum of used power in the system.

23. The method of assigning an initial uplink power level of claim 21 wherein the transmission from the mobile station to the base station is a data transmission, and the step of measuring at least one radio quality parameter from signals sent from the mobile station to the base station includes:

measuring at the base station, a signal strength of an initial access signal sent from the mobile station to the base station on a control channel; and

measuring at the base station, an interference level on an assigned packet data channel.

24. The method of assigning an initial uplink power level of claim 21 further comprising a closed loop power control step, the closed loop step including:

measuring at the base station, at least one radio quality parameter of the first data transmission from the mobile station;

utilizing the measured radio quality parameter to compute an adjusted mobile station power level; and

sending the adjusted mobile station power level from the base station to the mobile station.

25. The method of assigning an initial uplink power level of claim 21 wherein the step of building a historical database includes the steps of:

establishing an association of signal strength measurements on a control channel and interference measurements on a packet data channel; and

building a probability density function (PDF) of uplink power level settings for each combination of measured control channel signal strength and packet data channel interference.

26. The method of assigning an initial uplink power level of claim 25 wherein the PDF identifies the most common resulting adjusted mobile station power level computed by the closed loop power control step.

27. The method of assigning an initial uplink power level of claim 25 wherein the PDF identifies a median adjusted mobile station power level computed by the closed loop power control step.

28. The method of assigning an initial uplink power level of claim 21 wherein the step of measuring at the base station, at least one radio quality parameter from a signals sent from the mobile station to the base station includes measuring the signal strength of control signaling at initial system access on a control channel for a circuit-switched call.

29. The method of assigning an initial uplink power level of claim 21 wherein the initial uplink power level is being set at intercell handoff of the mobile station from a serving base station to a target base station, and the step of measuring at the base station, at least one radio quality parameter from signals sent from the mobile station to the base station includes measuring at the target base station, a radio quality parameter from an initial signal sent from the mobile station to the target base station.

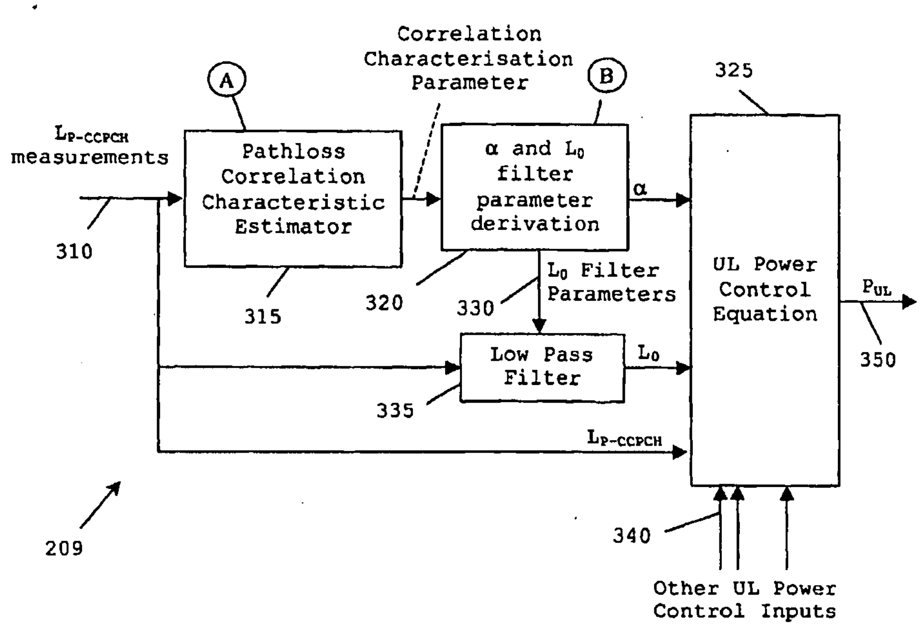
(54) Title: METHOD AND ARRANGEMENT FOR POWER USING PATH LOSS METRICS



(57) Abstract: A method for performing power control in a wireless communication unit (112) operating in a wireless communication system (100), includes the steps of: determining (315) a path loss correlation metric to derive one or more parameters pertaining to a wireless transmission; and adjusting an output power level of said wireless communication unit in response to said one or more parameters.Basing power control calculations on a path loss correlation metric provides the advantage of improved power control performance particularly for slow moving subscriber equipment without compromising power control performance at high speed.

METHOD AND ARRANGEMENT FOR POWER USING PATH LOSS METRICS

Field of the Invention

This invention relates to power control in a wireless communication system. The invention is applicable to, but not limited to, open loop power control in a UMTS terrestrial radio access (UTRA) time division duplex (TDD), code division multiple access (CDMA) communication system.

Background of the Invention

Wireless communication systems, for example cellular telephony or private mobile radio communication systems, typically provide for radio telecommunication links to be arranged between a plurality of base transceiver stations (BTS), referred to as Node Bs with regard to universal mobile telecommunication system (UMTS) systems, and a plurality of subscriber units, often referred to as user equipment (UE) in UMTS systems.

The communication link from a Node B to a UE is generally referred to as a down-link communication channel. Conversely, the communication link from a UE to a Node B is generally referred to as an up-link communication channel.

In a UTRA wireless communication system, each Node B has associated with it a particular geographical coverage area (or cell). The coverage area is defined by a particular range over which the Node B can maintain acceptable communications with UEs operating within its serving cell. Often these cells combine to produce an extensive coverage area.

In such wireless communication systems, methods for communicating information simultaneously exist where communication resources in a communication network are shared by a number of users. Such methods are termed multiple access techniques. A number of multiple access techniques exist, whereby a finite communication resource is divided into any number of physical parameters, such as:

(i) Frequency division multiple access (FDMA) whereby frequencies used in the communication system are shared,

(ii) Time division multiple access (TDMA) whereby each frequency used in the communication system, is shared amongst users by dividing the communication resource (each frequency) into a number of distinct time periods (time-slots, frames, etc.), and

(iii) Code division multiple access (CDMA) whereby communication is performed by using all of the respective frequencies, in all of the time periods, and the resource is shared by allocating each communication a particular code, to differentiate desired signals from undesired signals.

Within such multiple access techniques, different duplex (substantially simultaneous two-way communication) paths are arranged. Such paths can be arranged in a frequency division duplex (FDD) configuration, whereby a first frequency is dedicated for up-link communication and a second frequency is dedicated for down-link communication.

Alternatively, the paths can be arranged in a time division duplex (TDD) configuration, whereby a first time period is dedicated for up-link communication and a second time period is dedicated for down-link communication within the same frequency channel. In addition, some communication channels are used for carrying traffic and other channels are used for transferring control information, such as call paging, between the base station and the subscriber units.

Wireless communication systems are distinguished over fixed communication systems, such as the public switched telephone network (PSTN), principally in that mobile stations/subscriber equipment move between coverage areas served by different Node B (and/or different service providers). In doing so, the mobile stations/subscriber equipment encounter varying radio propagation environments. In particular, in a mobile context, a received signal level can vary rapidly due to multipath and fading effects.

The present invention will be described with respect to a 3rd generation partnership project (3GPP) communication system based on the universal mobile telecommunications standard (UMTS). UMTS is a CDMA-based system. A CDMA system employs spread spectrum signaling. Two categories of spread spectrum communications are direct sequence spread spectrum (DSSS) and frequency hopping spread spectrum (FHSS).

In the case of a DSSS communication system, for example, the spectrum of a signal can be most easily spread by multiplying it with a wide-band pseudo-random code generated signal. It is essential that the spreading signal be precisely known so that the receiver can de-spread the signal. A cellular communication system using DSSS is commonly known as a Direct Sequence Code Division Multiple Access (DS-CDMA) system, one example of which is defined in the TIA-EAI standard IS-95. Individual users in the system use the same radio frequencies (RF) and time slots but they are distinguishable from each other by the use of individual spreading codes. Hence, multiple communications channels are allocated using a number of spreading codes within a portion of the radio spectrum. Each code is uniquely assigned to a UE, except for common channels.

One feature associated with most wireless communication systems, which is particularly needed in a UTRA system, allows the transceivers in the Node B and UE to adjust their transmission output power to take into account the geographical distance between them. The closer the UE is to the Node B's transceiver, the less power the UE and Node B's transceivers are required to transmit, for the transmitted signal to be adequately received by the other unit. This 'power control' feature saves battery power in the UE and also helps to reduce interference effects. Initial power settings for the UE, along with other control information, are set by the information provided on a beacon physical channel for a particular cell.

In the context of the present invention, both up-link and down-link power settings can be controlled independently, although the present invention is described primarily with regard to up-link power control.

Precise reverse link power control is a vital element of CDMA systems as the spreading codes are not orthogonal on the reverse link. Hence, any error in the power control (PC) levels introduces interference that directly reduces system capacity.

Furthermore, it is known that the 3GPP standard is particularly sensitive to power control mismatches in the up-link because of fast fading effects in the communication channel. Fast fading is a known and generally undesirable phenomenon caused by the signal arriving at a receiver via a number of different paths. Therefore, in order to achieve maximum up-link capacity in a CDMA system, fast power control loops are required.

An inner power control (PC) loop is provided to adjust a UE's transmission power to counter the so-called "near-far" problem. The inner power control loop adjusts the transmission power of each connection such that the received signal power observed at the Node B is sufficient to meet a particular quality of service (QoS) requirement of each particular connection; thereby reducing interference to others in the system. The inner PC loop adjusts the UE's transmission power in order to keep the received reverse link signal-to-interference ratio (SIR) as close to constant as possible.

The predetermined threshold, to which the inner loop SIR measure is compared, is generated by the outer, quality-driven, power control loop. This loop sets a target SIR threshold that is proportionate with the required quality of service (QoS) for a given connection (usually defined in terms of target bit error rate (BER) or frame error rate (FER)). This target will vary as propagation conditions change, for example as a function of each UE's speed and its specific propagation environment, as both have an impact on the SIR required at the Node B to maintain the desired QoS.

The inner loop simply adjusts the transmit power from a UE to achieve the desired received SIR observed at the Node B. The actual transmit power of a UE generally has a fixed dynamic range that is primarily dictated by practical size and cost constraints. This means that the transmit power of the UE is constrained to lie somewhere within this range. If the UE is situated close to a Node B that it is communicating with, then the path loss between the UE and the Node B will, in general, be low, meaning that the transmission power of the UE to achieve a given SIR can also be low.

In the context of the present invention, an open-loop power control scheme is used in UTRA TDD-CDMA whereby user equipment (UE) adapts its transmit output level in accordance with measured path loss variations. These path loss variations are determined by regular measurements of the received signal code power (RSCP) of a downlink beacon physical channel. In the RSCP, the UE is provided with the reference power at which the beacon channel was transmitted. Hence, when this value is compared to the measured level of the received signal, the path loss can be calculated.

The UE then compensates for changes in the path loss by transmitting more or less power depending on whether the path loss has increased or decreased respectively.

Nominally, the open loop scheme runs at the radio frame rate of 10 msec., although an option exists within the UTRA standard to run at twice this rate by utilising two beacon physical channels per frame, i.e. spaced eight timeslots (8/15ths of a frame) apart.

Due to the update rate limitations of the scheme, the effectiveness of the loop at combating the aforementioned fast fading problem decreases with increasing UE speed. Hence, as PC is a critical issue in CDMA systems, a solution to the implementation of effective PC at high subscriber unit speeds is required.

The technical specification 'TS25.224' of the 3rd Generation Partnership Project (3GPP) specifies that a weighting parameter α can be used to weight the path loss towards the long-term-averaged path loss (L_0) and the instantaneous path loss $L_{P\text{-}CCPCH}$ as required. The equation that is used to implement the open loop power control scheme, is:

$$P_{UL} = \alpha L_{P\text{-}CCPCH} + (1-\alpha) L_0 + I_{BTS} + SIR_{TARGET} + Const. \quad [1]$$

Where:

P_{UL}: Power setting in dBm. This value corresponds to a particular CCTrCH (due to CCTrCH-specific SIR_{TARGET}) and a particular timeslot (due to possibly timeslot-specific α and I_{BTS}).

$L_{P\text{-}CCPCH}$: Measure representing path loss in dB (reference transmit power is broadcast on a broadcast channel (BCH)).

L_0: Long term average of path loss in dB.

I_{BTS}: Interference signal power level at cell's receiver in dBm, which is broadcast on a BCH.

α: α is a weighting parameter that represents the quality of path loss measurements. The

UTRA standard states: (i) α may be a function of the time delay between the up-link time slot and the most recent down link time slot containing a beacon channel; (ii) α shall be calculated autonomously at the UE, subject to a maximum allowed value which shall be signalled by higher layers.

SIR_{TARGET}: Target SIR in dB. A higher layer outer loop adjusts the target SIR.

Const.: This 'constant' value shall be set by higher Layer (defined by respective operators) and is broadcast on BCH.

In an annex of TS25.224 it is suggested that α could be made a function of the "delay" between the instantaneous path loss measurement $L_{P\text{-}CCPCH}$ (where CCPCH is the Common Control Physical Channel) and the up-link timeslot for which the power control calculation is being made.

However, although α could be set to be a function of the delay, or the up-link timeslot position in the frame, it is up to each equipment manufacturer how exactly to configure this set up. Furthermore, it is not apparent how power control performance can be usefully employed when configuring α in this manner.

A need therefore exists, in general, for an improved power control arrangement and method of operation, and in particular, an arrangement and method for open-loop power control for an UTRA-TDD system, wherein the abovementioned disadvantages may be alleviated.

Statement of Invention

In accordance with a first aspect of the present invention, there is provided a method for performing power control in a wireless communication unit, as claimed in claim 1.

In accordance with a second aspect of the present invention, there is provided a wireless communication unit, as claimed in claim 16.

In accordance with a third aspect of the present invention, there is provided wireless communication system, as claimed in claim 19.

In accordance with a fourth aspect of the present invention, there is provided a wireless communication unit, as claimed in claim 21.

In accordance with a fifth aspect of the present invention, there is provided a storage medium storing processor-implementable instructions, as claimed in claim 39.

In accordance with a sixth aspect of the present invention, there is provided a differentiator, as claimed in claim 40.

Brief Description of the Drawings

Exemplary embodiments of the present invention will now be described, with reference to the accompanying drawings, in which:

FIG. 1 shows a block diagram of a communication system that can be adapted to support the various inventive concepts of a preferred embodiment of the present invention;

FIG. 2 shows a functional block diagram of a UE, adapted in accordance with various inventive concepts of a preferred embodiment of the present invention;

FIG. 3 shows a flowchart/functional block diagram of a power control processing operation of a UE adapted to incorporating the present invention;

FIG. 4 shows a block schematic diagram illustrating the open-loop power control scheme on which the arrangement of FIG. 3 is based;

FIG. 5 shows an alternative manner of illustrating the power control processing function 209 of the embodiment of FIG. 4; and

FIG. 6 shows a block schematic diagram illustrating an alternative embodiment for implementing the open-loop power control scheme of FIG. 3.

Description of Preferred Embodiments

Referring now to FIG. 1, a cellular-based telephone communication system 100 is shown in outline, in accordance with a preferred embodiment of the invention. In the preferred embodiment of the invention, the cellular-based telephone communication system 100 is compliant with, and contains network elements capable of operating over, a UMTS air-interface. In particular, the invention relates to the Third Generation Partnership Project (3GPP) specification for wide-band code-division multiple access (WCDMA) standard relating to the UTRAN radio Interface (described in the 3G TS 25.xxx series of specifications).

A plurality of subscriber terminals (or user equipment (UE) in UMTS nomenclature) 112, 114, 116 communicate over radio links 118, 119, 120 with a plurality of base transceiver stations, referred to under UMTS terminology as Node-Bs, 122, 124, 126, 128, 130, 132. The system comprises many other UEs and Node Bs, which for clarity purposes are not shown.

The wireless communication system, sometimes referred to as a Network Operator's Network Domain, is connected to an external network 134, for example the Internet. The Network Operator's Network Domain (described with reference to both a 3rd generation UMTS and a 2nd generation GSM system) includes:

(i) A core network, namely at least one Gateway GPRS Support Node (GGSN) 144 and or at least one Serving GPRS Support Nodes (SGSN); and

(ii) An access network, namely:

(ai) a GPRS (or UMTS) Radio network controller (RNC) 136-140; or

(aii) Base Site Controller (BSC) in a GSM system and/or

(bi) a GPRS (or UMTS) Node B 122-132; or

(bii) a Base Transceiver Station (BTS) in a GSM system.

The GGSN/SGSN 144 is responsible for GPRS (or UMTS) interfacing with a Public Switched Data Network (PSDN) such as the Internet 134 or a Public Switched Telephone Network (PSTN) 134. A SGSN 144 performs a routing and tunnelling function for traffic within say, a GPRS core network, whilst a GGSN 144 links to external packet networks, in this case ones accessing the GPRS mode of the system

The Node-Bs 122-132 are connected to external networks, through base station controllers, referred to under UMTS terminology as Radio Network Controller stations (RNC), including the RNCs 136, 138, 140 and mobile switching centres (MSCs), such as MSC 142 (the others are, for clarity purposes, not shown) and SGSN 144 (the others are, for clarity purposes, not shown).

Each Node-B 122-132 contains one or more transceiver units and communicates with the rest of the cell-based system infrastructure via an I_{ub} interface, as defined in the UMTS specification.

Each RNC 136-140 may control one or more Node-Bs 122-132. Each MSC 142 provides a gateway to the external network 134. The Operations and Management Centre (OMC) 146 is operably connected to RNCs 136-140 and Node-Bs 122-132 (shown only with respect to Node-B 126 for clarity). The OMC 146 administers and manages sections of the cellular telephone communication system 100, as is understood by those skilled in the art.

In the preferred embodiment of the invention, a number of UEs 112-116 and/or corresponding Node-Bs 122-132 have been adapted, to offer, and provide for, adapted power controlled transmission, reception and processing of power control related information. In particular, the preferred embodiment of the present invention describes a feature that bases power control calculations on a good correlation of path loss across a received frame. In this manner, the feature can be added to the operation of the up-link inner-loop power control loop running at a layer-1 physical layer in the UE, in order to improve power control performance at low UE speed, whilst maintaining appropriate power control at high UE speed.

Advantageously, implementation of this invention allows standards compliance to be retained.

More particularly, in this embodiment the above UE elements have been adapted to implement the present invention in either or both up-link or down-link modes of operation. Although the preferred embodiment of the present invention is further described with respect to FIGs 3 to 6 for UE open loop power control in an up-link channel, it is envisaged that a Node B can in general, use the same inventive concepts in the down-link channel.

In such a closed-loop configuration, the Node B (or BTS) transmits a signal to the UE, which is processed to determine path loss correlated information. This information is transmitted from the UE back to the Node B, where it is received, processed, and PC settings used/assigned based on the path loss correlated information. In this manner, the use of a feature that bases power control calculations on a good correlation of path loss across a received frame can also improve the accuracy in setting down-link power control levels, albeit not in an open loop configuration. Such improved accuracy can help minimise system interference.

It is also envisaged that for other wireless communication systems, other criteria and/or equations could be employed in determining an appropriate power control scheme. Such schemes would still benefit from the concept of using path loss correlation parameters, as described herein.

It is also within the contemplation of the invention that such adaptation of the physical layer (air-interface) elements may be alternatively controlled, implemented in full or implemented in part by adapting any other suitable part of the communication system 100. For example, equivalent elements such as intermediate fixed communication units (for example repeaters) in other types of systems may, in appropriate circumstances, be adapted to provide or facilitate the power control features as described herein.

Referring now to FIG. 2, a block diagram of a UE 112 adapted to support the inventive concepts of the preferred embodiments of the present invention, is shown.

The UE 112 contains an antenna 202 preferably coupled to a duplex filter or circulator 204 that provides isolation between receive and transmit chains within UE 112.

The receiver chain includes receiver front-end circuitry 206 (effectively providing reception, filtering and intermediate or base-band frequency conversion). The front-end circuit 206 receives signal transmissions from its associated Node B. The front-end circuit 206 is serially coupled to a signal processing function (processor, generally realised by a DSP) 208. The processing function 208 performs signal demodulation, error correction and formatting. Recovered information from the signal processing function 208 is serially coupled to a power control processing function 209, which extracts pertinent power control information from the received (RSCP) signal and interprets the information to determine an appropriate transmit output level for the UE's transmissions.

The power control processing function 209 has been adapted in the following manner. In operation, as mentioned earlier, the up-link (UL) inner loop is updated at the radio frame rate of 10 msec. as each consecutive beacon-function RSCP is measured by the power control processing function 209 UE. For pedestrian and slow mobile conditions, where the UE is travelling at up to say, four Km/hr, the loop is capable of compensating for any fast fading present. Beyond these speeds, the radio channel becomes uncorrelated across the 10 msec. frame, and any instantaneous path loss measurement inferred from timeslot '0' can no longer be used as a good indicator of the path loss that will be experienced on any other timeslot in the same frame.

The inventor of the present invention has determined that, when there is good correlation of path loss across a radio frame period, it is better to use the 'instantaneous' measurement of RSCP in the power control processing function 209 for use in the UL open-loop PC calculations.

Conversely, when there is little or no correlation of path loss across the radio frame, the inventor of the present invention has determined that it is better to use, in the power control processing function 209 for UL open-loop PC, either (or both of):

(i) an adjusted 'filtered' (mean) RSCP signal/measurement;

(ii) an adjusted "α" parameter.

In particular, the power control processing function 209 of the preferred embodiment of the present invention involves setting the α value between a logical '1' and a logical '0' dependent upon the frame-to-frame path loss correlation seen in the radio channel. The operation of the power control processing function 209 is further described with respect to FIG. 3 to FIG. 6.

A timer 218 is preferably operably coupled to the processing function 208 and power control processing function 209 to provide synchronisation in the signal recovery process, including recovering the RSCP signal.

In different embodiments of the invention, the signal processing function 208 and baseband processing function 211 may be provided within the same physical device. The power control processing function 209 may also be provided within the same physical device with either the signal processing function 208 or the baseband processing function 211, or both.

As known in the art, received signals that have been processed by the power control processing function 209 are typically input to a baseband-processing device 210. The baseband processing device 210 takes the received information formatted in a suitable manner and sends it to an output device 211, such as an audio speaker or liquid crystal display or visual display unit (VDU). A controller 214 controls the information flow and operational state of each circuit/element/function.

As regards the transmit chain, this essentially includes an input device 220, such as a microphone, coupled in series through a baseband processor 210, a power control processing function 209, signal processing function 208, transmitter/modulation circuitry 222 and a power amplifier 224. The processor 208, transmitter/modulation circuitry 222 and the power amplifier 224 are operationally responsive to the controller, with an output from the power amplifier coupled to the duplex filter or circulator 204, as known in the art.

The transmit chain in UE 112 takes the baseband signal from input device 220 and converts this into a signal whose level can be baseband adjusted by the power control processor 209. The power control processor forwards the amplitude-adjusted signal to the signal processor 208, where it is encoded for transmission by transmit/ modulation circuitry 222, thereafter amplified by power amplifier 224, and radiated from antenna 202. Clearly, the adjustment of the transmit output power can be effected by any amplitude or attenuation means in the transmit chain, and the above baseband adjustment is described as one example only.

The signal processor function 208 in the transmit chain may be implemented as distinct from the processor in the receive chain. Alternatively, a single processor 208 may be used to implement processing of both transmit and receive signals, as shown in FIG. 2. Furthermore, the various components within the UE 112 can be realised in discrete or integrated component form.

Referring now to FIG. 3, a flowchart/functional block diagram of the power control processing operation 209 of a UE, adapted to incorporate the present invention, is shown in more detail.

In accordance with the UTRA recommendation, instantaneous path loss measurements $L_{P\text{-}CCPCH}$ 310 are performed for each received frame. Notably, in accordance with the preferred embodiment of the invention, the historical results of these measurements are used to derive a path loss correlation metric 315. The path loss correlation metric 315 is then used to derive any adjustment to the path loss weighting function α, in the parameter derivation function 320.

It is also envisaged that spectral analysis could be performed on the aforementioned path loss correlation over time of $L_{P\text{-}CCPCH}$ measurements. In this case, it is envisaged that a decision on α (or indeed one or more filter parameter(s) to be adapted as described below) could be based on such spectral analysis.

In addition, or as an alternative, to an adjustment of α, the inventor of the present invention has recognised that an adjustment of the filter bandwidth of the low-pass filter (LPF) 335, used to derive L_0 from $L_{P\text{-}CCPCH}$, can also be used for power control level adjustment in response to the path loss correlation information. Such a (L_0) filter-adjusted signal can be used instead of the direct instantaneous path loss measurements $L_{P\text{-}CCPCH}$ 310 in the power control calculation. It is envisaged that the L_0 filter parameters 330 may also be derived from the path loss correlation metric 315, in parameter derivation function 320.

The characteristics of this LPF 335 are not specified in the UTRA standard. Thus, as an alternative to changing α, or in addition to changing α, the filter bandwidth may be widened or narrowed in response to the observed correlation in the radio channel path loss. The LPF will likely be implemented as a digital filter and, as such, its frequency response parameters can be adjusted by appropriate adjustment of filter taps, as known to those skilled in the art.

In the preferred embodiment of the present invention, the parameter derivation function 320 therefore includes an algorithm to derive the parameter changes of α and/or L_0 for use in the UL power control equation 325.

Hence, as shown in FIG. 3, the UL power control equation 325 can be calculated using the current direct instantaneous path loss measurements $L_{P\text{-}CCPCH}$ 310 or, dependent upon the path loss correlation metric, using parameter adjustments to α and/or a bandwidth-adjusted filtered signal (L_0) equivalent to a filtered version of the instantaneous path loss measurements $L_{P\text{-}CCPCH}$ 310 (L_0).

For high-speed UE scenarios, the path loss correlation metric 315 is likely to report low path loss correlation. As such, it is envisaged that the $L_{P\text{-}CCPCH}$ direct measurements 310 are not used in the up-link power control equation 325, which also receives the other control inputs 340, as specified in the UTRA standard. This course of action is appropriate since the $L_{P\text{-}CCPCH}$ direct measurements 310 cannot be guaranteed to be applicable to other timeslots in the same radio frame period.

It is within the contemplation of the invention that many techniques could be designed to implement the path loss correlation metric 315 and subsequent adjustment and/or derivation algorithm 320. However, two examples of how the inventive concepts of the present invention could be applied are described below with respect to FIG. 4 and FIG. 6.

Referring now to FIG. 4, a block schematic diagram 209 of a preferred open-loop power control scheme, on which the arrangement of FIG. 3 is based, is illustrated.

As indicated earlier, instantaneous path loss measurements $L_{P\text{-}CCPCH}$ 310 are performed for each received frame. Notably, the results of these measurements are used to perform a path loss correlation metric by inputting them to a differentiator function 415, followed by a thresholder 420 and frequency counter 430. It is envisaged that the differentiator function 415 may be considered essentially as a high-pass filter. Alternatively, for example, the differentiator function 415 may perform a bi-linear transform of a standard difference equation, as known in the art.

In the differentiator function 415, each consecutive $L_{P\text{-}CCPCH}$ 310 measurement (in dB) is compared to the same measurement for the previous frame, and a difference value (Y) produced:

$$Y = \text{abs}\ (x_{(n)} - x_{(n-1)}) \qquad [2]$$

The sign of the difference is discarded by taking the absolute (abs) value, and the value is checked in the thresholder 420 to see whether it is above or below a threshold value TdB 425 that is held as a constant in a memory element of the UE 112. This comparison is then input to a counter 430, to determine an α-based switch control signal 460. The α-based switch control signal 460 ensures that the switch 410 selects the most appropriate measurement to use in the power control equation 325.

If, for example, the counter determines that more than P% of these differences provided by the differentiator function 415 are observed to be smaller than TdB 425, say over a time period T_{span}, it can be assumed that there is good path loss correlation over time. Hence, the unfiltered path loss values ($L_{P-CCPCH}$) 455 (direct instantaneous path loss measurements) are selected for the UL open-loop calculations in response to the α-based switch control signal 460 (where α='1').

Conversely, if less than P% of these differences provided by the differentiator function 415 are observed to be smaller than TdB 425, it can be assumed that there is poor path loss correlation per time period. In such a case, the filtered $L_{P-CCPCH}$ value (L_0) 450, output from the LPF 335, is selected for the UL open-loop calculations in response to the α-based switch control signal 460 (where α='0').

Hence, the power control processing function 209 of the preferred embodiment of the present invention involves setting the α value between a logical '1' and a logical '0' dependent upon the frame-to-frame path loss correlation seen in the radio channel.

It is envisaged that suitable values for the above parameters could be, for example, respectively:

T_{span}: of the order of 1 or 2 seconds;

TdB 425: of the order of 2 or 3dB; and

P%: of the order of 70%-80%.

Hence, a weighting of α is given to $L_{P\text{-}CCPCH}$, and a weighting of $(1-\alpha)$ is given to L_0. So if $\alpha=0$, we end up using only filtered path loss L_0. If $\alpha=1$, we end up using only instantaneous $L_{P\text{-}CCPCH}$ measurements. The switch in FIG. 4 therefore denotes this hard-switching between the two path loss measurements (filtered and unfiltered).

Hence, in the context of this embodiment, the path loss correlation metric determines whether an adapted L_0 or the direct $L_{P\text{-}CCPCH}$ measurements are used in the UL power control equation 325. Again, it is envisaged that for high-speed scenarios, the L_0 measurements are used in the up-link power control equation 325. Other control inputs such as SIR_{Target} 446, a constant value 444 and I_{BTS} 442 are used, as specified in the UTRA standard. An adjustment algorithm, designed to maximise the benefit of such a scheme, is again used in conjunction with the output 350 of the up-link power control equation 325.

It is within the contemplation of the invention that other inputs may also be used in the final PC equation, together with the path loss correlation indication described herein.

Referring now to FIG. 5, an alternative manner of illustrating the power control processing function 209 of the embodiment of FIG. 4, is shown. Again, instantaneous path loss measurements $L_{P\text{-}CCPCH}$ 310 are performed for each received frame. The results of these measurements are used to derive a path loss correlation metric by inputting them to a differentiator function 415, as in FIG. 4.

The output of the differentiator function is then input to an α decision logic function 510 that includes a thresholder 420 followed by a frequency counter 430. The operation is the same as that for FIG. 4, albeit in this arrangement, all three inputs (α, $L_{P\text{-}CCPCH}$ 310 and L_0 320) are input directly to the power control equation 325. Hence, no switch or switch control signal, per se, is used to prevent a measurement from being used by the power control equation 325. Clearly, similar parameters to those described with reference to FIG. 4 would also be applicable in FIG. 5.

Referring now to FIG. 6, a block schematic diagram 209 of an alternative embodiment for implementing the open-loop power control scheme of FIG. 3, is illustrated.

Again, instantaneous path loss measurements $L_{P\text{-}CCPCH}$ 310 are performed for each received frame. Notably, the results of these measurements are used to perform a path loss correlation metric by inputting them to a differentiator function followed by variance estimator 605.

Again, as in the example of FIG. 4, each consecutive $L_{P\text{-}CCPCH}$ 310 measurement from the PCCPCH RSCP signal (in dBm) is compared to the same measurement for the previous frame and a difference value produced $(x_n - x_{n-1})$. In contrast to the embodiment of FIG. 4, the difference value is then squared to produce a variance estimation Δ_n, where:

$$\Delta_n = (x_n - x_{n-1})^2 \qquad [3]$$

The variance estimation Δ_n is then filtered using, for example, a simple IIR filter 610 to produce the function:

$$F_n = A.F_{n-1} + B.\Delta_n \qquad [4]$$

where: A and B are filter coefficients, and
'A+B' = '1'

It is noteworthy that if n=0, i.e. it is the first iteration, the IIR filter 610 is initialised with:

$$F_0 = \Delta_n \qquad [5]$$

The α decision logic 615 then derives α_n from F_n via a lookup table 620. A typical example is shown below in Table 1.

Table 1:

α_n	F_n
0	<3
0.1	<3.5
0.2	<4
0.3	<4.3
0.4	<4.6
0.5	<4.9
0.6	<5.2
0.7	<5.5
0.8	<5.8
0.9	<6.1
1.0	<6.4

In operation, the lowest value of α_n satisfying the right hand column is selected. The values in the right hand column are preferably programmable and may be used to optimise performance the performance of the power control scheme. The values in the right hand column of the table effectively control the variation of α in response to the variance estimate of the differentiated path loss. They may be optimised either via computer simulation of loop performance, or via appropriate in-field or laboratory testing.

The various components within the UE 112 are realised in this embodiment in integrated component form. Of course, in other embodiments, they may be realized in discrete form, or a mixture of integrated components and discrete components, or indeed any other suitable form.

Furthermore, in this embodiment the power control processor function is implemented preferably in a digital signal processor. However, it is within the contemplation of the invention that the power control processor function 209 described in the above embodiments can be embodied in any suitable form of software, firmware or hardware. The power control processor function 209 may be controlled by processor-implementable instructions and/or data, for carrying out the methods and processes described, which are stored in a storage medium or memory, for example the memory element 216. The processor-implementable instructions and/or data may include any of the following:

(i) The algorithm for deriving the α and/or L_0 parameters,

(ii) A new or adapted lookup table,

(iii) A new or adapted path loss correlation metric algorithm for use in function 315,

(iv) A new threshold value 425,

(v) A new frequency counter value (P), or

(vi) A new time period T_{span}, used to generate the path loss correlation metric.

The memory can be a circuit component or module, e.g. a RAM or PROM, or a removable storage medium such as a disk, or other suitable medium.

It will be understood that the method and arrangement for open-loop power control described above provides at least the following advantages:

(i) Improved power control performance for slow moving mobiles without compromising performance at high speed.

(ii) Implementation of the path loss correlation metric improves the UE power control performance whilst remaining standard compliant with the UTRA-TDD PC operation.

(iii) Although the use of a path loss correlation metric finds particular benefits in an up-link open-loop scenario, similar measurements can be used by the Node B or BTS to improve the accuracy in closed loop power control techniques. Hence, the technique is also beneficial in a down-link context.

(iv) The equipment designer has a choice on how best to implement the inventive concepts, using either an α adjustment or adjustment of the LPF characteristics.

Hence, the aforementioned method and arrangement for providing power control substantially negates at least the problems associated with the update rate limitations of the PC scheme in an UTRA-TDD CDMA wireless communication system. Furthermore, improved power control at lower speeds is achieved when there is a good correlation of path loss across a radio frame period, by using the instantaneous measurement of RSCP for use in the UL open-loop PC calculations. Conversely, when there is little or no correlation of path loss across the radio frame at high speeds, the filtered (mean) RSCP measurement is used for UL open-loop PC.

Thus, a configuration and method for effecting power control in a wireless communication system has been described wherein the aforementioned disadvantages associated with prior art arrangements has been substantially alleviated.

Whilst specific, and preferred, implementations of the present invention are described above, it is clear that one skilled in the art could readily apply variations and modifications of such inventive concepts.

Claims

1. A method for performing power control in a wireless communication unit operating in a wireless communication system, the method comprising the steps of:

determining a path loss correlation metric to derive one or more parameters pertaining to a wireless transmission; and

adjusting an output power level of said wireless communication unit in response to said one or more parameters.

2. The method for performing power control in a wireless communication unit according to Claim 1, wherein said step of adjusting an output power level of said wireless communication unit is performed in an open-loop power control manner for an up-link transmission by a wireless subscriber communication unit.

3. The method for performing power control in a wireless communication unit according to any preceding Claim, wherein the step of adjusting an output power level of said wireless communication unit is performed in one or more of the following steps based on said path loss correlation metric:

adjusting a weighting parameter;

adjusting one or more filter parameters that adjust a frequency response of a filter.

4. The method for performing power control in a wireless communication unit according to any preceding Claim, the method further comprising the step of:

making a number of instantaneous path loss measurements (LP-CCPCH) over a number of frames received by said wireless communication unit;

wherein said step of determining said path loss correlation metric is based on said number of instantaneous path loss measurements.

5. The method for performing power control in a wireless communication unit according to Claim 4, wherein said step of determining said path loss correlation metric includes the step of:

comparing a first instantaneous path loss measurement to one or more previous instantaneous path loss measurements.

6. The method for performing power control in a wireless communication unit according to Claim 5, the method further comprising the steps of:

producing a difference value from said comparison step; and

discarding a sign of said difference value to obtain an absolute difference value to provide a path loss correlation indication.

7. The method for performing power control in a wireless communication unit according to Claim 6, the method further comprising the step of:

comparing said absolute difference value with a threshold to provide a path loss correlation metric.

8. The method for performing power control in a wireless communication unit according to Claim 6 or Claim 7, the method further comprising the step of:

selecting said number of instantaneous path loss measurements in calculating an adjustment of output power level if said absolute difference value is determined to be above or below a threshold for more than a specified percentage of a period of time; or

selecting a filter adjusted input of said number of instantaneous path loss measurements in calculating an adjustment of output power level if said absolute difference value is determined to be above or below a threshold for more than a specified percentage of a period of time.

9. The method for performing power control in a wireless communication unit according to Claim 6, the method further comprising the step of:

performing a variance estimation of said difference value to provide a path loss correlation metric.

10. The method for performing power control in a wireless communication unit according to Claim 9, the method further comprising the step of:

performing an averaging function, for example using an IIR filter, to provide a time-averaged path loss correlation metric.

11. The method for performing power control in a wireless communication unit according to Claim 10, when dependent upon Claim 4, the method further comprising the step of:

comparing said time-averaged path loss correlation metric to values held in a lookup table, for example a lookup table indexed as a function of the path loss correlation metric, in order to calculate a weighting parameter based on a path loss correlation metric.

12. The method for performing power control in a wireless communication unit according to Claim 11, the method further comprising the step of:

selecting said instantaneous path loss measurements or a filtered number of instantaneous path loss measurements in calculating an adjustment of output power level based on said weighting parameter (α).

13. The method for performing power control in a wireless communication unit according to Claim 8 or Claim 12, the method further comprising the step of:

selecting said number of filtered instantaneous path loss measurements for calculating an output power level of said wireless communication unit when said wireless communication unit is travelling at a relatively high speed; or

selecting said instantaneous path loss measurements for calculating an output power level of said wireless communication unit when said wireless communication unit is travelling at a relatively low speed.

14. The method for performing power control in a wireless communication unit according to any preceding Claim, the method further comprising the step of:

performing spectral analysis on said correlation of instantaneous path loss measurements to derive said weighting parameter or said one or more filter parameters.

15. The method for performing power control in a wireless communication unit according to any preceding Claim, wherein said power control is performed by a wireless subscriber unit for use in an open-loop up-link power control mode of operation.

16. A wireless communication unit adapted to incorporate the method steps of any of preceding Claims 1 to 15.

17. The wireless communication unit according to Claim 16, wherein said communication unit is a user equipment for use in an open loop power control arrangement.

18. The wireless communication unit according to Claim 16, wherein said communication unit is a base transceiver station or Node B for use in a closed loop power control arrangement.

19. A wireless communication system adapted to incorporate the method steps of any of preceding Claims 1 to 15.

20. The wireless communication system according to Claim 19, wherein said communication system is an UTRA-TDD CDMA wireless communication system.

21. A wireless communication unit capable of performing power control when operating in a wireless communication system, the wireless communication unit comprising:

a power control processing function that includes:

a path loss correlation metric determination function to derive one or more parameters pertaining to a wireless transmission; and

adjustment means operably coupled to said path loss correlation metric determination function to adjust an output power level of said wireless communication unit in response to said one or more parameters.

22. The wireless communication unit according to Claim 21, the wireless communication unit further comprising:

a receiver operably coupled to said power control processing function for receiving a transmission from a transmitting wireless communication unit and providing a signal for analysis; and

calculation means operably coupled to said receiver path loss correlation metric determination function for receiving said signal and determining a number of instantaneous path loss values to be forwarded to said path loss correlation metric determination function.

23. The wireless communication unit according to Claim 21 or Claim 22, wherein said adjustment means adjusts an output power level of said wireless communication unit in

an open-loop power control manner for an up-link transmission by a wireless subscriber communication unit.

24. The wireless communication unit according to any of preceding Claims 21 to 23, wherein said adjustment means includes a weighting parameter input and/or a filter input and said adjustment means adjusts an output power level of said wireless communication unit in one or more of the following ways:

adjusts a weighting parameter based on a path loss correlation metric;

adjusts one or more filter parameters that adjust a frequency response of a filter in response to said path loss correlation metric.

25. The wireless communication unit according to any of preceding Claims 21 to 24, wherein said power control processing function performs a number of instantaneous path loss measurements (LP-CCPCH) over a number of frames received by said wireless communication unit and said path loss correlation metric is based on said number of instantaneous path loss measurements.

26. The wireless communication unit according to Claim 25, wherein said path loss correlation metric determination function comprises a differentiator function utilising one or more instantaneous path loss measurements to obtain a path loss correlation indication.

27. The wireless communication unit according to Claim 26, wherein said differentiator function produces a difference value and discards a sign of said difference value to obtain an absolute difference value to provide a path loss correlation indication.

28. The wireless communication unit according to Claim 27, the power control processing function further comprising decision logic operably coupled to said differentiator function to compare said absolute difference value with a threshold to provide a path loss correlation metric.

29. The wireless communication unit according to Claim 28, wherein said path loss correlation metric determination is based on a number of parameter values, wherein said parameter values include one or more of the following:

a period of time, for example of the order of one or two seconds,

said threshold value for a difference between said path loss correlation metrics,

a number of samples where said threshold value is exceeded over said period of time.

30. The wireless communication unit according to Claim 29, wherein said one or more parameter values are substantially of the order of the following:

period of time is between a half and three seconds;

threshold value is between one and five dB;

number of samples is between 70% to 80%.

31. The wireless communication unit according to any of preceding Claims 28 to 30, the power control processing function further comprising a switch and switch control, operably coupled to said decision logic, said switch and switch control configured to:

select said number of instantaneous path loss measurements in calculating an adjustment of output power level if said absolute difference value is determined to be above or below a threshold over a period of time; or

select a filter-adjusted input of said number of instantaneous path loss measurements in calculating an adjustment of output power level if said absolute difference value is determined to be above or below a threshold over a period of time.

32. The wireless communication unit according to Claim 27, the path loss correlation metric determination function comprising a variance estimator function to determine a variance of said difference value(s) to provide a path loss correlation metric.

33. The wireless communication unit according to Claim 32, the path loss correlation metric determination function further comprising:

a decision logic function that includes an averaging function, for example an infinite impulse response filter, operably coupled to said variance estimator function, to provide a time-averaged path loss correlation metric.

34. The wireless communication unit according to Claim 33, when dependent upon Claim 24, wherein said decision logic function is operably coupled to a lookup table and compares said time-averaged path loss correlation metric to values held in a lookup table, for example a lookup table indexed as a function of the path loss correlation metric, in order to calculate a weighting parameter based on a path loss correlation metric.

35. The wireless communication unit according to Claim 34, the power control processing function further comprising calculation means for calculating an output transmit power level for said wireless communication unit, said calculation means selecting said number of instantaneous path loss measurements or a filter-adjusted value of said number of instantaneous path loss measurements in calculating an adjustment of output power level based on said weighting parameter.

36. The wireless communication unit according to any of preceding Claims 21 to 35, wherein said power control is performed by a wireless subscriber communication unit for use in an open-loop up-link power control mode of operation.

37. The wireless communication unit according to Claim 36 when dependent upon Claim 31 or Claim 35, wherein said power control processing function selects said filtered path loss measurements for calculating an output power level of said wireless communication unit when said wireless communication unit is travelling at a relatively

high speed; and/or selects said instantaneous path loss measurements for calculating an output power level of said wireless communication unit when said wireless communication unit is travelling at a relatively low speed.

38. The wireless communication unit according to any of preceding Claims 21 to 35, wherein said wireless communication unit is a base transceiver station or Node B for use in an closed loop power control arrangement.

39. A storage medium storing processor-implementable instructions for controlling a processor to carry out the method of any of Claims 1 to 15.

40. A differentiator adapted to utilise one or more instantaneous path loss measurements to obtain a path loss correlation indication in accordance with any of Claims 26 to 28.

EXAMINER	
REGO, DOMINIC E	

ART UNIT	PAPER NUMBER
2618	

MAIL DATE	DELIVERY MODE
07/02/2007	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.	Applicant(s)
	10/917,968	ANDERSON, NICHOLAS WILLIAM
	Examiner	Art Unit
	Dominic E. Rego	2618

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *12 August 2004*.

2a)☐ This action is **FINAL**. 2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-13* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-13* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)

2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

3) ☒ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date *04/23/2007*.

4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.

5) ☐ Notice of Informal Patent Application

6) ☐ Other: _____.

DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

> The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

2. Claim 13 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. The claimed limitations "an output providing a sum of past step instruction" are not found in the specification and it is non-enabling.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

> A person shall be entitled to a patent unless –
>
> (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-7,9,10,12,and 13 are rejected under 35 U.S.C. 102(e) as being anticipated by Zeira et al. (International Publication Number #WO 00/57574).

Regarding claim 1, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising:

determining a path loss of a radio channel between a base station and a remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);

receiving a transmit power control (TPC) command transmitted to the remote transceiver from the base station (Page 4, line 17-Page 5, line 8); and

calculating a transmit power level for the remote transceiver based on the path loss and the TPC command (Page 4, line 17-Page 5, line 8).

Regarding claim 2, Zeira teaches the method of power control, the method further comprising transmitting an uplink signal from the remote transceiver at the calculated transmit power level (Page 5, lines 4-8).

Regarding claim 3, Zeira teaches the method of power control, wherein determining the path loss includes: receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and measuring a received power level of the downlink signal (Page 2, lines 14-21; Page 4, lines 17-page 8).

Regarding claim 4, Zeira teaches the method of power control, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level (Page 2, lines 1-lines 21; Page 5, lines 2-lines 4).

Regarding claim 5, Zeira teaches the method of power control, the method further comprising:

generating the TPC command; and transmitting the TPC command from the base station (Page 4, line 21-Page 5, line 1).

Regarding claims 6 and 7, Zeira teaches the method of power control, wherein the calculating the transmit power level is additionally based on an adjustment factor, wherein the adjustment factor incorporates a spreading factor parameter (Page 13, lines 2-9).

Regarding claim 9, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising:

receiving a signal at a second transceiver transmitted from a first transceiver (Page 2, lines 14-17; Page 4, lines 18-20);

measuring a power level of the received signal (Page 2, lines 14-18);

receiving a transmit power control (TPC) command at the second transceiver transmitted from the first transceiver (Page 4, line 18-Page 5, line 1); and

calculating a transmit power level for the second transceiver based on the power level of the received signal and the TPC command (Page 4, line 18-Page 5, line 8).

Regarding claim 10, Zeira teaches a method of uplink power control in a CDMA radio communications system, the method comprising:

receiving an uplink signal (Page 3, lines 1-7; Page 6, lines 1-9);

measuring a received SNIR of the uplink signal (Page 3, lines 1-7;Page 7, lines 9-15);

comparing the measured received SNIR with an SNIR target (Page 3, lines 1-7; Page 7, lines 9-15);

assigning a first value to a step indicator if the measured received SNIR is greater than the SNIR target, and assigning a second value to a step indicator if the measured received SNIR is less than the SNIR target (Page 3, lines 1-7; Page 3, line 16-8);

transmitting a transmit power control (TPC) command instructing a transmitter to adjust an uplink transmit power level based on the step indicator *(Page 3, lines 1-7: Zeira teaches the determined SIR is compared to a target SIR (SIR target). Based on the comparison, the base station 30 transmits a power command. After receiving the power command, the UE 32(1) increase or decrease its transmission power level based on the received power command)*;

receiving the TPC command including the step indicator; accumulating the step indicator value *(Page 3, lines 1-7: Zeira teaches after receiving the power command, the UE 32(1) increase or decrease (step indicator) its transmission power level based on the receive power command)*;

broadcasting a downlink signal including an indication of a downlink power level, wherein the signal is transmitted at the downlink power level *(Page 3, lines 1-7: Zeira teaches based on the comparison between the determined SIR with a target SIR (SIR target), base station 30(1) transmits a power command; Also see page 3, line 16-Page 4, line 8)*;

measuring the received power of the downlink signal; and setting a transmit power level based on the received power level, the indication of the downlink power level, and the accumulated step indicator value *(Page 3, lines 1-7: Zeira teaches after receiving the power command, the UE 32(1) increase or decrease its transmission* *power level based on the received power command; Page 3, line 16-Page 4, line 8; Page 7, lines 9-15).*

Regarding claim 12, Zeira teaches a method comprising:

measuring a power level of a received signal (Page 2, lines 14-18);

receiving a transmit power control (TPC) command (Page 4, line 18-Page 5, line 1); and

calculating a transmit power level based on the power level of the received signal and the TPC command (Page 4, line 18-Page 5, line 8).

Regarding claim 13, as best understood in 112 1st paragraph, Zeira teaches a radio comprising:

a receiver including an output to provide a measured received power level (Page 2, lines 14-18);

an accumulator having an input for accepting step increase and decrease instructions and an output providing a sum of past step instructions *(Page 3, lines 1-7: Zeira teaches the base station 30(1) determines the signal to interference ratio (SIR) of a communication received from the UE 32(1). The determined SIR is compared to a target SIR (SIR target). Based on the comparison, the base station 30(1) transmits a power command. After receiving the power command, the UE 32(1) increase or decrease its transmission power level based on the received power command)*;

a power level setting circuit coupled to the accumulator output and coupled to the receiver output, wherein the power level setting circuit sets a transmit power bases on the accumulator output and the measured received power level; and a transmitter, wherein the transmitter transmits a signal at the set transmit power *(Page 3, lines 1-7: Zeira teaches the base station 30(1) determines the signal to interference ratio (SIR) of a communication received from the UE 32(1). The determined SIR is compared to a target SIR (SIR target). Based on the comparison, the base station 30(1) transmits a power command. After receiving the power command, the UE 32(1) increase or decrease its transmission power level based on the received power command; Page 3, line 16-Page 4, line 8; Page 7, lines 9-15).*

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

6. Claim 8 is rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Shiu et al. (US Patent #6,983,166).

Regarding claim 8, Zeira fails to teach the method of power control, wherein the adjustment factor incorporates a selected transport format parameter.

However, in related art, Shiu teaches the method of power control, wherein the adjustment factor incorporates a selected transport format parameter (Col 3, lines 27-41).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Shiu to Zeira in order to achieve target BLERs (See Shiu, Col 3, line 31).

7. Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Zeira et al. (US Patent Application Publication #2004/0141483) in view of Bevan et al. (US Patent Application Publication #2004/0162093) and further in view of Kamet et al. (US Patent #7,190,688).

Regarding claim 11, Zeira (WO 00/57574) fails to teach the method of power control, further comprising:

determining an error metric of the uplink signal;

updating the SNIR target based on the error metric;

measuring an interference value in the received uplink signal; and

updating an interference measurement table with the interference value;

wherein broadcasting the downlink signal further includes the interference measurement table; and

wherein setting the transmit power level is further based on a value in the interference measurement table.

However, in related art, Zeira (US 2004/0141483) teaches determining an error metric of the uplink signal; updating the SNIR target based on the error metric (Paragraph 0039).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Zeira (US 2004/0141483) to Zeira (WO 00/57574) in order to achieve the desired BLER (Paragraph 0041).

The combination of Zeira (US 2004/0141483) and Zeira (WO 00/57574) fails to teach measuring an interference value in the received uplink signal; and updating an interference measurement table with the interference value.

However, in related art, Bevan teaches measuring an interference value in the received uplink signal; and updating an interference measurement table with the interference value (Paragraph 0063).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Bevan to Zeira (US 2004/0141483) and Zeira (WO 00/57574) in order to adjust the transmission power level.

The combination of Zeira (US 2004/0141483), Zeira (WO 00/57574), and Bevan fails to teach wherein broadcasting the downlink signal further includes the interference measurement table; and wherein setting the transmit power level is further based on a value in the interference measurement table.

However, in related art, Kamel teaches wherein broadcasting the downlink signal further includes the interference measurement table; and wherein setting the transmit power level is further based on a value in the interference measurement table (Col 3, lines 29-lines 51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Kamel to Zeira (US 2004/0141483), Zeira (WO 00/57574) and Bevan, in order to adjust the power level.

Conclusion

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Shinozaki (US 2005/0130690) teaches transmission power control method and transmission power control device.

Simonsson et al. (US 2005/0136961) teaches power control method.

Zhang et al. (US 2005/0113127) teaches method and apparatus for efficient processing of data for transmission in a communication system.

Butala (US 2004/0203987) teaches reducing interference with a multiple format channel in a communication system.

Oh et al. (US 2004/0137860) teaches fast converging power control for wireless communication systems.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dominic E. Rego whose telephone number is 571-272-8132. The examiner can normally be reached on Monday-Friday, 8:30 am-5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nay Maung can be reached on 571-272-7882. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). MS Amendment
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Dear Sir:

Pursuant to 37 C.F.R. §1.97 and § 1.98, Applicants submit for consideration in the above-identified application the documents listed on the attached Form PTO/SB/08a/b. Copies of foreign documents and non-patent literature are submitted herewith. The Examiner is requested to make these documents of record.

sf-2365894

This Supplemental Information Disclosure Statement is submitted:

☐ With the application; accordingly, no fee or separate requirements are required.

☐ Before the mailing of a first Office Action after the filing of a Request for Continued Examination under § 1.114. However, if applicable, a certification under 37 C.F.R. § 1.97 (e)(1) has been provided.

☐ Within three months of the application filing date or before mailing of a first Office Action on the merits; accordingly, no fee or separate requirements are required. However, if applicable, a certification under 37 C.F.R. § 1.97 (e)(1) has been provided.

☒ **After receipt of a first Office Action on the merits but before mailing of a final Office Action or Notice of Allowance.**

- ☐ A fee is required. A check in the amount of __ is enclosed.
- ☒ **A fee is required. Accordingly, a Fee Transmittal form (PTO/SB/17) is attached to this submission in duplicate.**
- ☐ A Certification under 37 C.F.R. § 1.97(e) is provided above; accordingly; no fee is believed to be due.

☐ After mailing of a final Office Action or Notice of Allowance, but before payment of the issue fee.

- ☐ A Certification under 37 C.F.R. § 1.97(e) is provided above and a check in the amount of __ is enclosed.
- ☐ A Certification under 37 C.F.R. § 1.97(e) is provided above and a Fee Transmittal form (PTO/SB/17 is attached to this submission in duplicate.)

Applicants would appreciate the Examiner initialing and returning the Form PTO/SB/08a/b, indicating that the information has been considered and made of record herein.

The information contained in this Supplemental Information Disclosure Statement under 37 C.F.R. § 1.97 and § 1.98 is not to be construed as a representation that: (i) a complete search has been made; (ii) additional information material to the examination of this application does not exist; (iii) the information, protocols, results and the like reported by third parties are accurate or enabling; or (iv) the above information constitutes prior art to the subject invention.

In the unlikely event that the transmittal form is separated from this document and the Patent and Trademark Office determines that an extension and/or other relief (such as payment of a fee under 37 C.F.R. § 1.17 (p)) is required, Applicants petition for any required relief including extensions of time and authorize the Commissioner to charge the cost of such petition and/or other fees due in connection with the filing of this document to **Deposit Account No. 03-1952** referencing 562492000500.

Dated: October 2, 2007

(54) Abstract Title

Power control in mobile telecommunications systems

(57) In an UTRA-TDD communications system, a mobile terminal implements open loop power control of its transmitter power by identifying downlink time slots in which reference signals, comprising mid-amble codes, are transmitted from a base station. For power control of an uplink time slot, that one of such identified downlink slots which is closest in time to immediately before the uplink slot is selected and the reference signal energy (or power) measurement for that downlink slot is used by the mobile terminal to infer the path loss in order to control its transmit power in the uplink slot. The fact that measured mid-amble energy should exceed total noise energy by a predetermined margin in any downlink slot containing a mid-amble code is used to identify such slots. To effect this identification, the signal 80 received by the mobile is passed via an A-D converter (not shown) to a matched filter 10 in which correlation against the mid-able code is achieved by means of a shift register 110 and multipliers 130 to 144 which receive respective bit codes corresponding to the mid-amble code. The output 90 of a summator 150 passes to an energy measuring circuit 20 which computes the modulus squared to provide an energy measure for a particular path. As signal 80 is clocked through shift register 110, circuit 20 determines energy values for other paths, and an accumulator 30 provides an output 100 indicative of the total energy for all the paths for a given period of the mid-amble code. The input signal 80 is also passed directly to an energy measuring circuit 40 connected to an accumulator 50, the output of which corresponds to the noise energy summed for all paths over the given period of the mid-amble code. The output of accumulator 30 and the output from accumulator 50, weighted in unit 60, are input to a comparator 70 which gives a "1" output when a downlink slot containing a reference signal (mid-amble code) has been identified.

IMPROVEMENTS IN OR RELATING TO MOBILE TELECOMMUNICATIONS SYSTEMS

The present invention relates to improvements in or relating to mobile telecommunications systems, and is more particularly concerned with open loop power control for such systems.

The UMTS terrestrial radio access (UTRA) – time division duplex (TDD) system is based on a combination of code division multiple access (CDMA) and hybrid time division multiple access (TDMA) and TDD. (UMTS is an acronym for universal mobile telecommunication system as understood by persons skilled in the art.)

As the UTRA-TDD system is based on CDMA, its performance is dependent on the operation of power control, particularly, for the uplink connection, that is, the connection from a mobile terminal to a base station. Furthermore, as the system is also based on TDD, the uplink and downlink (base station to mobile terminal) connections use the same frequency and so the channel is reciprocal. Measurements of the received power on the downlink connection can be used to estimate the path loss if the base station transmit power is known at the mobile station. Therefore, if the level of interference present and the required signal-to-noise ratio of the base station are communicated to the mobile station, the mobile station can combine this information to set the correct power for reception at the base station. This procedure is known as open loop power control.

The UTRA-TDD system has a TDMA/TDD frame consisting of sixteen time slots over a period of 10ms, each time slot lasting 0.625ms. Within such a system, some time slots are permanently assigned to downlink connections for broadcast purposes, and at least one other time slot to the uplink connection for access purposes. The remaining time slots may freely be assigned to either uplink or downlink connections as traffic requirements dictate. The time slots in which downlink connections are transmitted include reference signals of known data patterns which assist in the decoding of the transmission.

The UTRA-TDD system will usually be deployed in a cellular configuration in which the same frequency will be re-used in all cells – each cell comprising a base station and a plurality of mobile terminals within an area covered by the base station. Moreover the TDMA/TDD frames of all cells will be synchronised. However, in many cases, the inter-cell interference will be too great to permit traffic to be actively transmitted in all time slots in all cells. Accordingly, it has been proposed that the time slots be allocated to cells according to a dynamic channel assignment (DCA) algorithm to reduce inter-cell interference to acceptable levels.

As described above, a measurement of power in a downlink time slot provides an estimate of the path loss. However, if a mobile terminal is moving at relatively high speed this path loss will be rapidly changing. Thus, if, for example, a measurement is performed on time slot 0, that is, at the beginning of a frame, the path loss estimated from this measurement will be out of date by, say, time slot 8. Thus, an open loop power control scheme which performed measurements in slot 0 and used these measurements to set the transmit power in slot 8 would not control the received signal-to-noise ratio at the base station very accurately. In fact, the best performance that can be achieved will apply when the power measurement is performed in time slot N and is used to set the transmit power in time slot $N + 1$, where, for UTRA-TDD, $0 \leq N \leq 15$. In some cases, the best that can be achieved will be to perform the power measurement in time slot N and set the transmit power in time slot $N + M$ where M is made as small as possible and where, for UTRA-TDD, $0 \leq N \leq (16 - M)$.

It is therefore an object of the present invention to provide a method which allows the best performance to be achieved wherever practically possible.

In particular, within the structure of UTRA-TDD, all time slot transmissions consist of three elements, which, in time order, are - data burst 1, a reference signal and data burst 2. Because UTRA-TDD is based on CDMA, the data bursts may consist of several spread spectrum modulated components each carrying data and summed together. For the downlink, and where smart antennas are not applied, there is only one common reference signal transmitted. The reference signal comprises a fixed code against which correlations are performed for the purpose of deriving channel estimates.

Within a downlink time slot transmission, the different codes transmitting the data bursts may be intended for reception at different mobile stations. In general, in order to minimise inter-cell interference, and therefore to maximise system capacity, the powers of the individual codes are controlled independently so as to transmit only enough power to satisfy the signal-to-noise plus interference requirements at each mobile station. According to known techniques, the reference signal transmit power is set to be equal to the sum of the powers of the individual codes.

In accordance with one aspect of the present invention, there is provided a method of providing open loop power control in a hybrid TDD/TDMA mobile telecommunications system wherein reference signals of known data patterns are transmitted in downlink time slots, using reference signal energy measurements, the telecommunications system comprising at least one base station and at least one mobile terminal, the method comprising:-

a) receiving an input signal at the mobile terminal;

b) measuring and summing the energy of the reference signals in the input signal in one or more multipath components by correlation against the reference signal to obtain an overall received reference signal energy measurement;

c) measuring the total received signal energy;

d) comparing the received reference signal energy measurement with the total received signal energy measurement to obtain an indication of the presence of a reference signal;

e) selecting the reference signal position for which the time difference to the next uplink transmission from the terminal is substantially minimised; and;

f) using the corresponding reference signal energy measurement for open loop power control.

It will readily be appreciated that although reference is made to 'energy' measurements, these measurements are interchangeable wwith 'power' measurements to provide open loop power control.

It is preferred that, in all active downlink slots, that is, downlink slots in which one or more data burst codes are being transmitted, the power of the reference signals in the same time slot in adjacent frames should be held constant and the reference signal energy measurements should be used for open loop power control.

By keeping the power of the reference signals constant, and either by making this power a global constant, known to the mobile terminals or by signalling this value to the mobile terminals at suitable intervals from each base station, the mobile terminal can infer the path loss from measurements of the reference signal. However, it will be appreciated that the reference signal power need not be held constant and each time slot may have its own individual reference signal power.

For a better understanding of the present invention, reference will now be made, by way of example only, to the accompanying drawing, the single Figure of which illustrates a block diagram of a circuit for detecting the presence of a reference signal and for measuring the energy of such a signal in accordance with the present invention.

In accordance with the present invention, a mobile terminal performs measurements of reference signal energy in all time slots, other than those time slots in which it is transmitting. These time slots can be divided into three categories, namely, time slots in which no transmissions are being made either in the uplink or the downlink direction, time slots in which uplink transmissions are being made, and time slots in which downlink transmissions are being made. However, only time slots which are in the last of these categories are of interest.

In order to determine the reference signal energy for the time slots in which downlink transmissions are being made, it is necessary to identify these time slots. In the present case, the reference signals comprise mid-amble codes as they are transmitted midway through a downlink time slot. However, it will be appreciated that the reference signals can be transmitted at other positions within the time slot.

One embodiment of a circuit for determining the presence of a mid-amble code and measuring its energy is shown in Figure 1. The circuit shown in Figure 1 comprises a matched filter 10, a first energy measuring circuit 20, a first accumulator 30, a second energy measuring circuit 40, a second accumulator 50, a weighting unit 60, and a comparator 70. The matched filter 10 is connected to receive a complex baseband data input signal 80, and to provide an output signal 90. The matched filter 10 is matched to the mid-amble code for the system.

As shown, the matched filter 10 comprises a shift register 110 having eight elements 112, 114, 116, 118, 120, 122, 124, 126, eight multipliers 130, 132, 134, 136, 138, 140, 142, 144, and a summator 150. It will readily be appreciated that although the shift register is shown as having eight elements, any other suitable number may be used according to the particular application. It will, however, be noted that the number of multipliers is the same as the number of elements in the shift register and the number of elements in the code.

The baseband data input signal 80 is applied to the elements 112, 114, 116, 118, 120, 122, 124, 126 of the shift register 110 and the values stored in each element is passed to a respective one of the multipliers 130, 132, 134, 136, 138, 140, 142, 144 where they are combined with a respective bit code corresponding to the mid-amble code of the system. Output signals from the multipliers 130, 132, 134, 136, 138, 140, 142, 144 are then passed to summator 150 where they are summed and the output signal 90 is produced. Output signal 90 corresponds to the path gain for a particular path.

Output signal 90 is then passed to the first energy measuring circuit 20 where the modulus squared thereof is computed to provide an energy value for the path.

As the input signal 80 is clocked through the shift register 110, the energy values for other paths are determined in energy measuring circuit 20 and passed to the first accumulator 30 where the energy values for each path are summed with the accumulated energy values for previous paths. Accumulator 30 provides an output signal 100 which is indicative of the total energy for all the paths for a given period of the mid-amble code.

In any downlink slot containing a mid-amble code, the measured mid-amble energy as measured after correlation in the matched filter 10 should exceed the total noise energy by a predetermined margin. Thus, the presence of a downlink mid-amble code is determined by measuring the noise energy over the period of the mid-amble code and comparing with output signal 100.

To effect this comparison, the input signal 80 is passed directly to the second energy measuring circuit 40 where the energy value in each path is determined as before. The accumulations are arranged to continue over the period of the mid-amble code as described above in accumulator 50 to provide the noise energy corresponding to all the path. However, as several path positions are added together, the noise energy measurement must be weighted accordingly. In UTRA-TDD, the period over which paths are measured is n chips, for example, $n = 57$. Path energy measurements for all n positions will multiply the noise energy or power level by n.

Alternatively, the weighting factor can be reduced if path thresholding is performed. This can be done by taking longer term averages over mid-amble code measurements for those time slots in which the downlink mid-amble code is known to be transmitted, such as, the time slot known to contain the common control physical channel (CCPCH). In this way, the exact chip positions of known mid-amble code paths, assuming that the mid-amble code is transmitted, can be identified for the entire frame. If, for example, a maximum of eight paths are taken to be non-zero, then the noise energy for comparison will be weighted only by 8 rather than by n.

The energy values for all paths in the period of the mid-amble code are passed to weighting unit 60 so that the noise energy values can have the appropriate weighting applied as described above prior to providing output signal 104 as shown.

Output signal 104 is then passed to the comparator 70. Output signal 100 from the first accumulator 30 is also passed to the comparator 70. Comparator 70 compares the two signals 100, 104 and provides an output signal 108 which is indicative of that comparison. Output signal 108 from the comparator 70 either comprises a '0' or a '1'. In the former case, this means that the difference between signal 100 and signal 104 does not exceed the predetermined margin, as defined by the value incorporated into the signal by weighting unit 60, and therefore the energy values measured relate to noise as no mid-amble code is present. In the latter case, this means that the difference between signal 100 and signal 104 exceeds the predetermined margin and a mid-amble code has been detected.

Thus, in accordance with the present invention described above, it is possible to identify downlink time slots containing mid-amble codes. The measurements of the downlink energy values can be further improved by subtracting the noise measurements in order to obtain unbiased measurements of the signal only component (not shown). Having identified the downlink slots containing mid-amble codes, it remains only to select the most appropriate mid-amble code for open loop power control. This consists of selecting the mid-amble code, which is closest in time to immediately before the uplink time slot. Where available the immediately preceding time slot would be used. However, if the mobile terminal receiver is implemented in such a way that there is some latency in the measurement of the time slot energy, for example, one time slot, then the minimum gap will clearly increase (to one time slot in this specific example) for this latency.

It will be appreciated that the circuit described above operates in the digital domain, the complex baseband input signal 80 being in digital form after being processed by an analogue-to-digital converter (ADC) (not shown).

Automatic gain control (AGC) may be applied to set the levels of the signals passing into the ADC. However, it will be noted that the analogue AGC will operate on the composite input signal rather than any specific component such as a mid-amble.

As described above, the mobile terminal makes autonomous selection of the downlink time slots to use for open loop power control. However, the process cannot compensate for unfortuitous assignments of the time slots by the base station. Accordingly, also in accordance with the present invention, the time slots in the base station can be assigned in such a way as to maximise the benefits of energy measurements for open loop power control. There are several approaches which can be implemented to achieve an optimisation of these measurements.

In one embodiment, a mid-amble code is transmitted in every time slot which has been assigned to downlink operation in that base station, whether data bursts are being transmitted in that time slot or not. This increases the number of downlink time slots containing mid-amble code transmissions.

In another embodiment, a mid-amble code is transmitted in every time slot, which has been assigned to downlink operation, in every base station operating within the system.

A further embodiment utilises the fact that whenever a call is set up in UTRA-TDD, at least one resource unit must be allocated in both the uplink and the downlink. A resource unit is defined as a combination of a time slot and a spread spectrum code. In this embodiment, the call set up procedure in the base station is arranged to assign downlink resource unit(s) in a time slot as close in time to immediately before the time slot assigned for the uplink resource unit(s) as possible. Where the required number of resource units in either or both directions dictates that more than one time slot be assigned for that direction, these time slots should be assigned in such a way as to maximise the benefit for open loop power control. Except where unavoidable, consecutive time slots should not be assigned to uplink operation since the power setting for the later time slots will be further from that required than the power setting for the first time slots. In most cases, it should be possible to satisfy the condition since asymmetrical operation will most often be required to provide greater downlink than uplink data rates.

Additionally, the operation of the dynamic channel assignment (DCA) can be optimised. Optimum operation arises when the uplink time slots for a given base station are close in time following the downlink time slots for that same base station. By constraining the DCA algorithm to allocate contiguous blocks of time slots to each base station, the operation can be optimised. Moreover, the allocation for each base station should arrange for the first time slot to be dedicated to downlink operation and the last to uplink with the intermediate time slots assigned to optimise the operation of open loop power control but consistently with the long to medium term balance between uplink and downlink traffic loads.

CLAIMS:

1. A method of providing open loop power control in a hybrid TDD/TDMA mobile telecommunications system wherein reference signals of known data patterns are transmitted in downlink time slots, using reference signal energy measurements, the telecommunications system comprising at least one base station and at least one mobile terminal, the method comprising:-

a) receiving an input signal at the mobile terminal;

b) measuring and summing the energy of the reference signals in the input signal in one or more multipath components by correlation against the reference signal to obtain an overall received reference signal energy measurement;

c) measuring the total received signal energy;

d) comparing the received reference signal energy measurement with the total received signal energy measurement to obtain an indication of the presence of a reference signal;

e) selecting the reference signal position for which the time difference to the next uplink transmission from the terminal is substantially minimised; and;

f) using the corresponding reference signal energy measurement for open loop power control.

2. A method according to claim 1, further comprising the step of:-

g) assigning time slots in the base station for maximising measurements for open loop power control.

3. A method according to claim 2, wherein step g) comprises transmitting a reference signal in every time slot.

4. A method according to claim 3, further comprising transmitting a reference signal in every time slot for every base station.

5. A method according to claim 2, wherein step g) comprises allocating at least one resource unit in a downlink connection in a time slot as close in time to immediately before a time slot allocated for at least one resource unit in an uplink connection.

(54) **TRANSMITTING APPARATUS AND TRANSMITTING METHOD**

(57) Transmit power determining section 100 determines a transmit power value based on the condition of the propagation path estimated from a propagation loss and the number of times the random access channel signal is retransmitted. Midamble pattern determining section 103 determines a midamble pattern corresponding to the transmit power value from among a plurality of midamble patterns. Time multiplexing section 102 creates a transmission signal by multiplexing transmission data subjected to spreading processing and the midamble pattern. Radio section 104 applies predetermined transmission processing to the transmission signal generated and transmits the transmission signal subjected to the transmission processing above using the determined transmit power value as a random access channel signal.

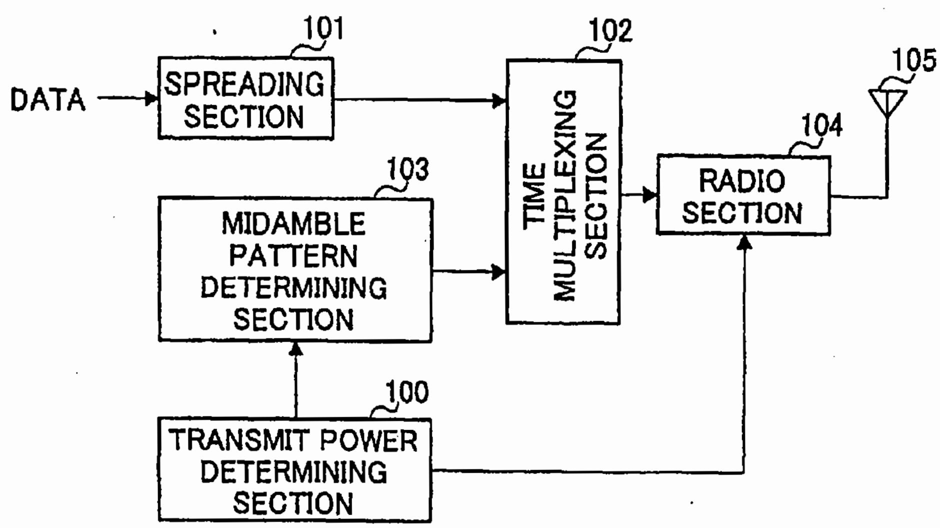

FIG.8

Description

Technical Field

[0001] The present invention relates to a communication apparatus that cancels interference using matrix calculations in a CDMA (Code Division Multiple Access) based communication, and more particularly, to a communication apparatus that cancels interference during a random access communication.

Background Art

[0002] One of conventional methods of extracting a demodulated signal by eliminating various kinds of interference such as interference due to multi-path fading, inter-symbol interference and multiple access interference is an interference signal elimination method using Joint Detection (hereinafter referred to as "JD"). This JD is disclosed in the "zero Forcing and Minimum Mean-Square-Error Equalization for Multiuser Detection in Code-Division Multiple-Access Channels" (Klein A., Kaleh G.K., Baier P.W., IEEE Trans . Vehicular Technology, vol.45, pp.276-287, 1996.).

[0003] This interference signal elimination method using JD is also used for a random access communication carried out when a mobile station apparatus starts to communicate with a base station apparatus.

[0004] The conventional interference signal elimination method using JD will be explained below taking a case where a mobile station apparatus carries out a random access communication with a base station apparatus as an example.

[0005] In a random access communication, the mobile station apparatus that attempts to start a communication sends a signal for requesting the start of a communication via a random access channel ("RACH") to the base station apparatus first. In this transmission, the mobile station apparatus also sends a known reference signal called "midamble code". For convenience of explanations, the signal sent by the mobile station apparatus through the random access channel is called a "RACH signal".

[0006] The pattern of a midamble code (hereinafter referred to as "midamble pattern") is created as follows. FIG.1 is a schematic view showing a method of creating a midamble pattern in a conventional CDMA communication system.

[0007] As shown in FIG.1, the midamble pattern used for each mobile station apparatus (each channel) is created using a basic code that is repeated a cycle of 456 (=8W) chips following the procedure shown below. This basic code is known to the base station apparatus and includes 8 blocks A to H made up of mutually different codes each having a length of W (=57) chips.

[0008] As a first step, a reference block is set for the basic code above. Here, suppose the reference block is "A". As a second step, the phase of the reference block above is shifted leftward in the figure by {W x (n-1)} for every channel. Here, W=57 chips and n is a channel number. As a third step, for every channel in the basic code above, 512 chips are extracted from the leading section of the reference block whose phase has been shifted in the second step. In this way, a midamble pattern with a length of 512 chips as a whole is created for every channel.

[0009] The mobile station apparatus transmits an RACH signal shown in FIG.2 using any one of midamble patterns created as shown above. FIG. 2 is a schematic view showing transmission timing of each mobile station apparatus in a conventional CDMA communication system.

[0010] As shown in FIG.2, each mobile station apparatus transmits a transmission signal with a midamble code inserted between data section 1 and data section 2. The signal transmitted by data section 1 or data section 2 corresponds to a signal requesting for the start of a communication as described above. This signal transmits, for example, an ID number of a mobile station apparatus. In FIG.2, the transmission signals of channels 1 to 8 correspond to the RACH signals transmitted by mobile station apparatuses 1 to 8, respectively.

[0011] Then, processing by the base station apparatus that has received the RACH signals will be explained with reference to FIG.3 to FIG.5. FIG.3 is a schematic view conceptually showing a first example of a situation in which a base station apparatus in a conventional CDMA communication system receives an RACH signal from each mobile station apparatus. FIG.4 is a block diagram showing a configuration of a base station apparatus to which a conventional interference signal elimination method using JD is applied. FIG.5 is a schematic view showing a first example of a delay profile obtained by the base station apparatus to which the conventional interference signal elimination method using JD is applied.

[0012] Each mobile station apparatus is located at a certain distance from the base station apparatus and the distance between each mobile station apparatus and the base station apparatus varies from one mobile station apparatus to another. Thus, as shown in FIG.3, a propagation delay is produced by the time an RACH signal sent from each mobile station apparatus arrives at the base station apparatus, which produces variations in propagation delays among the mobile station apparatuses. That is, propagation delays produced until the RACH signals sent from mobile station apparatuses 1, 2, 3, ···, 8 arrive at the base station are propagation delays 1, 2, 3, ···, 8, respectively. The signal received by the base station apparatus is a signal resulting from multiplexing the RACH signals from the respective mobile station apparatuses with the respective propagation delays shown in FIG.3.

[0013] The base station apparatus carries out the following processing to extract data for each mobile station apparatus by eliminating interference such as interference caused by multi-path fading, inter-symbol interference and multiple access interference.

[0014] According to FIG.4, the received signal resulting from multiplexing the RACH signals sent from the respective mobile station apparatuses is subjected to predetermined radio processing such as frequency conversion and then sent to delay section 11 and matched filter (MF) 12. Delay section 11 delays the received signal by a predetermined time and sends the delayed signal to multiplier 14, which will be described later.

[0015] Matched filter 12 carries out correlation value calculation processing using the midamble code section and the above-described cyclic basic code in the received signal and thereby calculates a channel estimated value corresponding to each mobile station apparatus. Furthermore, applying a power calculation to the calculated channel estimated values gives delay profiles as shown in FIG.5. According to FIG.5, when a propagation delay of each mobile station apparatus is smaller than a W-chip length, the section in which a delay profile appears is determined for each mobile station apparatus. That is, in the above case, the delay profiles corresponding to mobile station apparatuses 1 to 8 appear in sections 1 to 8 each having a length of W chips (hereinafter referred to as "W-chip section").

[0016] According to FIG.4, the channel estimated values of the respective mobile station apparatuses calculated by matched filter 12 are sent to joint detection (hereinafter referred to as "JD") section 13.

[0017] JD section 13 performs the following matrix calculations using the channel estimated values of the respective mobile station apparatuses. That is, by carrying out convolutional calculations between the channel estimated values of the respective mobile station apparatuses and spreading codes applied to data sections assigned to the respective mobile station apparatuses, convolutional calculation results (matrix) for the respective mobile station apparatuses are obtained. Through these calculations, a matrix is obtained in which the convolutional calculation results of the respective mobile station apparatuses are regularly placed (hereinafter referred to as "system matrix"). Here, for convenience of explanations, the system matrix is expressed as [A].

[0018] Further, by carrying out a matrix calculation using the system matrix as shown in the following expression, matrix [B] is obtained.

$$[B] = ([A]^H \cdot [A])^{-1} \cdot [A]^H \qquad ①$$

where $[A]^H$ is a conjugate transposed matrix of the system matrix and $([A]^H \cdot [A])^{-1}$ is an inverse matrix of $[A]^H \cdot [A]$.

[0019] Matrix [B] obtained from such a matrix calculation is sent to multiplication section 14.

[0020] Multiplication section 14 carries out multiplication processing (that is, interference elimination demodulation processing) between the data section of the received signal from delay section 11 and the matrix from JD section 13 and obtains data stripped of interference for the respective mobile station apparatuses. Thus, the base station apparatus recognizes ID numbers of the mobile station apparatuses that have requested for the start of a communication and thereby accepts these mobile station apparatuses as the mobile station apparatuses with which to communicate.

[0021] After such a random access communication, the base station apparatus sends a signal indicating that these mobile station apparatuses have been accepted via a forward access channel (FACH). For convenience of explanations, a signal sent by the base station apparatus via a forward access channel is called an "FACH signal".

[0022] Each mobile station apparatus that has sent an RACH signal can recognize whether the communication request has been accepted by the base station apparatus or not by checking the content of the received FACH signal. The mobile station apparatus whose communication request has been accepted performs a normal communication with the base station apparatus. The mobile station apparatus whose communication request has not been accepted performs a random access communication again.

[0023] However, in the above-described conventional interference signal elimination method using JD, as the radius of a cell increases, an RACH signal sent from a mobile station apparatus farther from the base station apparatus has a greater propagation delay, and therefore the sum of the propagation delay and delay variance of this RACH signal may exceed the W-chip length. In this case, the delay profile corresponding to the above mobile station apparatus does not appear in an expected W-chip section as shown in FIG.5, but appears in another W-chip section.

[0024] This case will be explained with reference to FIG.6 and FIG.7. FIG. 6 is a schematic view conceptually showing a second example of a situation in which a conventional base station apparatus based on a CDMA communication system receives an RACH signal from each mobile station apparatus. FIG.7 is a schematic view showing a second example of delay profiles obtained from a base station apparatus to which a conventional interference signal elimination method using JD is applied. Here, suppose a propagation delay of an RACH signal sent from mobile station apparatus 2 (channel 2) is greater than the W-chip length.

[0025] Since mobile station apparatus 2 is located far from the base station apparatus, the propagation delay of the RACH signal sent from mobile station apparatus 2 is large as shown in FIG.6. For this reason, the propagation delay corresponding to mobile station apparatus 2 is greater than the W-chip length as shown in FIG. 7. As a result, the delay profile corresponding to mobile station apparatus 2 does not appear in the expected W-chip section (that is, W-chip section "2"). The delay profile corresponding to mobile station apparatus 2 may appear another W-chip section (that is, for example, W-chip section "3").

[0026] As described above, delay profiles obtained by the base station apparatus corresponding to mobile station apparatuses located far from the base station apparatus do not appear in expected W-chip sections, and therefore it is not possible to calculate channel estimated values corresponding to the above mobile station apparatuses. Furthermore, the delay profiles corresponding to the above mobile station apparatuses appear in W-chip sections corresponding to other mobile station apparatuses, causing the channel estimated values corresponding to the other mobile station apparatuses to become inaccurate.

[0027] As a result, the result of the matrix calculation carried out by above-described JD section 13 (see FIG. 4) becomes inaccurate, deteriorating the characteristic of the interference elimination demodulation processing of multiplication section 14 degrades. Thus, the base station apparatus cannot perform demodulation for the user who is so distant that the propagation delay is greater than W chips. Thus, the base station apparatus may be unable to recognize not only the ID number of the above mobile station apparatus but also the ID numbers of other mobile station apparatuses, making it impossible to accept these mobile station apparatuses as the mobile station apparatuses with which to communicate.

[0028] As shown above, according to the conventional interference signal elimination method using JD, when a mobile station apparatus located in a place where the sum of a propagation delay and delay variance exceeds the W-chip length carries out random access, not only this mobile station apparatus but also other mobile station apparatuses carrying out random access communication are unlikely to be accepted by the base station apparatus.

[0029] In the case where the base station apparatus sends a control command for adjusting the transmission timing of each mobile station apparatus taking into account a propagation delay to each mobile station apparatus using the downlink, the delay profile corresponding to each mobile station apparatus will appear in the expected W-chip section. However, a random access communication is a kind of communication whereby each mobile station apparatus sends an RACH signal to the base station apparatus before the base station apparatus carries out transmission to each mobile station apparatus using an individual downlink. Therefore, in a random access communication, the base station apparatus cannot control the transmission timing of each mobile station apparatus .

[0030] As a measure to prevent this problem, there is a method of increasing the width of the W-chip section by increasing phase W to be shifted in the first step above. However, according to this method, the number of users (number of communication terminal apparatuses) who can be accommodated through matrix calculations using JD will be reduced on condition that the midamble length is fixed. Increasing the length of a midamble makes it possible to increase the width of the W section without changing the number of users who can be accommodated, but since the proportion of the midamble section in the entire RACH signal increases, which results in a decrease of the transmission capacity.

Disclosure of Invention

[0031] It is an object of the present invention to provide a transmission apparatus capable of improving the probability of successful random access communications without affecting the number of communication terminal apparatuses that can be accommodated and transmission capacity.

[0032] First, in view that the condition of a propagation path differs from one communication terminal apparatus to another and that a propagation delay of a communication terminal apparatus that has sent an RACH signal via a propagation path with a small propagation loss is small, while a propagation delay of a communication terminal apparatus that has sent an RACH signal via a propagation path with a large propagation loss is large, the present inventor et al. has come up with the present invention by discovering that assigning a known reference signal which will reduce the length of a delay profile that can be created to a communication terminal apparatus with a small propagation loss and assigning a known reference signal which will increase the length of a delay profile that can be created to a communication terminal apparatus with a large propagation loss will increase the probability that the delay profile corresponding to each communication terminal apparatus will appear in an expected section without increasing the proportion of the known reference signal section in the communication format.

[0033] Second, in view that a communication terminal apparatus fails in a random access communication because the delay profile corresponding to this communication terminal apparatus does not appear in the expected section, the present inventor et al. has come up with the present invention by discovering that assigning a known reference signal with a longer delay profile than the previous one to this communication terminal apparatus will increase the probability that the delay profile corresponding to this communication terminal apparatus will appear in the expected section.

[0034] The object of the present invention is attained by setting a known reference signal to be assigned to each communication terminal apparatus based on at least one of the condition of a propagation path and the number of times the random access channel signal is retransmitted. Furthermore, the object of the present invention is attained by controlling not only a known reference signal to be assigned to each communication terminal apparatus but also a transmit power value of the random access channel signal of each communication terminal apparatus based on at least one of the propagation path condition and the number of times the random access channel signal is retransmitted.

Best Mode for Carrying out the Invention

[0036] With reference now to the attached drawings, embodiments of the present invention will be explained in detail below.

(Embodiment 1)

[0037] FIG.8 is a block diagram showing a configuration of a mobile station apparatus equipped with a transmission apparatus according to Embodiment 1 of the present invention. In FIG.8, transmit power determining section 100 calculates a propagation loss between this mobile station apparatus and a base station apparatus using a signal transmitted through an information channel (hereinafter referred to as "information channel signal"). Furthermore, transmit power determining section 100 determines a transmit power value of an RACH signal according to the calculated propagation loss and the number of times the RACH signal is retransmitted. The determined transmit power value is sent to midamble pattern determining section 103 and radio section 104.

[0038] Spreading section 101 performs spreading processing on the transmission data using a spreading code assigned to this mobile station apparatus. This transmission data corresponds to data subjected to predetermined modulation processing, for example, the ID number of this mobile station apparatus. The transmission data subjected to spreading processing is sent to time multiplexing section 102.

[0039] Midamble pattern determining section 103 selects any one of a plurality of midamble patterns provided based on the transmit power value determined by transmit power determining section 100 and sends to time multiplexing section 102. The midamble pattern is a known reference signal used for channel estimation at the base station apparatus that receives the signal sent by this mobile station apparatus . Details of the midamble pattern will be explained later.

[0040] Time multiplexing section 102 creates a transmission signal by multiplexing the midamble pattern from midamble pattern determining section 103 and the transmission data subjected to spreading processing on a frame. As a frame format, as in the case of the frame format shown in FIG.2, the format including data section 1, midamble section and data section 2 is used. The midamble section is the part in which a midamble pattern is inserted.

[0041] Radio section 104 carries out predetermined processing such as frequency conversion on the transmission signal created by time multiplexing section 102 and sends the transmission signal subjected to the above-described predetermined processing as an RACH signal via antenna 105. During this transmission, radio section 104 transmits the RACH signal using the transmit power value determined by transmit power determining section 100.

[0042] FIG.9 is a block diagram showing a configuration of the base station apparatus equipped with a reception apparatus according to Embodiment 1 of the present invention. In FIG.9, the signal received (received signal) via an antenna (not shown) is subjected to predetermined radio processing such as frequency conversion and sent to delay section 201 and matched filter (MF) 202. This received signal is mainly a signal with the RACH signals sent from a plurality of mobile station apparatuses multiplexed on a same frequency band. Furthermore, the above-described plurality of mobile station apparatuses each has the configuration shown in FIG.8.

[0043] Delay section 201 delays the received signal by a predetermined time and sends the delayed received signal to multiplication section 204. Matched filter 202 performs correlation value calculation processing using the midamble code section in the received signal and a known basic code to calculate a channel estimated value for each mobile station apparatus. JD section 203 performs a matrix calculation using the channel estimated value from matched filter 202 and sends the matrix calculation result to multiplication section 204. Multiplication section 204 performs interference elimination demodulation processing using the received signal from delay section 201 and the matrix calculation result from JD section 203.

[0044] Then, the method of creating a midamble pattern to be assigned to each mobile station apparatus will be explained with reference to FIG.10. In this embodiment, suppose the total number of midamble patterns is 8 as an example. FIG.10 is a schematic view showing a procedure for creating midamble patterns used for a mobile station apparatus equipped with a transmission apparatus according to Embodiment 1 of the present invention. As shown in FIG.10, a midamble pattern used for each mobile station apparatus (each channel) is created using a basic code that is repeated in a cycle of 456 chips (=8W) according to the following procedure.

[0045] This basic code includes 8 blocks "A" to "H" with mutually different codes and chip lengths (code lengths) and is known to the base station apparatus shown in FIG.9. Furthermore, the chip length of each block is set to increase in the ascending order of A to G. Here, H is assumed to have a length of 57 chips. More specifically, this basic code contains a plurality of codes formed by a plurality of blocks with mutually different codes and code lengths sequentially arranged according to the code length (here, codes "A", "B" to "G" "H" in a length of 456 chips).

[0046] As a first step, a reference block is set in the above-described basic code. Here, the reference block is assumed to be "A" as an example. As a second step, the phase of the above-described reference block is shifted leftward in the figure by 0, W1, W1+W2, ···, W1+W2+ ···+W5+W6, , W1+W2, W6+W7 (W1<W2<···<W6<W7) for the respective channels (channels 1, 2, 3, ···, 7, 8). In this way, reference blocks of the respective channels (channels 1, 2, 3, ···, 7, 8) are "A", "B", "C", ···, "G", "H".

[0047] As a third step, for every channel in the basic code above, 512 chips are extracted from the leading section of the reference block whose phase has been shifted in the second step. Thus, a midamble pattern of 512 chips as a whole is created for each channel. FIG. 10 shows midamble patterns of channels 1, 2, 3, 4 and 8.

[0048] Then, operations in a random access communication of the mobile station apparatus equipped with the transmission apparatus in the above configuration and the base station apparatus equipped with the reception apparatus in the above configuration will be explained. First, an operation of the mobile station apparatus equipped with the transmission apparatus according to this embodiment will be explained.

[0049] When power to the mobile station apparatus shown in FIG.8 is turned on, transmit power determining section 100 calculates a propagation loss between the mobile station apparatus and the base station apparatus using an information channel signal sent from the base station apparatus shown in FIG. 9 based on the transmit power value of the information channel signal at the base station apparatus and the receive power value of an information channel signal at the mobile station apparatus.

[0050] The calculated propagation loss becomes an index to indicate the condition of the propagation path. When propagation loss is large, the distance between the mobile station apparatus and the base station apparatus may be large or even if the distance between the mobile station apparatus and the base station apparatus is small, radio waves may be attenuating due to reflections by obstacles or buildings, etc.

[0051] Furthermore, transmit power determining section 100 determines the transmit power value of the RACH signal based on the calculated propagation loss and the number of times the RACH signal is retransmitted.

[0052] More specifically, by adding an offset value according to the number of retransmissions to a preset basic value, a new basic value is calculated. Then, by adding a propagation loss to the basic value calculated in this way, a transmit power value is determined. Thus, as the propagation loss or the number of retransmissions increases, the transmit power value determined increases.

[0053] For example, in the case where the number of retransmissions of an RACH signal is 0 (that is, when a random access communication is performed for the first time), a value obtained by adding a propagation loss to the basic value becomes the transmit power value. When the number of retransmissions of the RACH signal is 1, a value obtained by adding an offset value to the basic value becomes a new basic value and a value obtained by adding a propagation loss to this basic value becomes a transmit power value. As the number of retransmissions further increases, the basic value increases and the transmit power value of the RACH signal increases. At this time, as the propagation loss increases, the transmit power value further increases. The determined transmit power value is sent to midamble pattern determining section 103 and radio section 104.

[0054] Midamble determining section 103 selects a midamble pattern based on the transmit power value determined by transmit power determining section 100. The method of selecting a midamble pattern will be explained with reference to FIG.11. FIG.11 shows a table used by midamble pattern determining section 103 at a mobile station apparatus equipped with the transmission apparatus according to Embodiment 1 of the present invention. In FIG.11, the "transmit power value" field shows transmit power values (P1 to P8 (P1<P2<···<P8<··· <P7)) determined by transmit power determining section 100 and the "reference block" field shows reference blocks (A to H) in the midamble patterns corresponding to these transmit power values. This reference block corresponds to the reference block set in the second step when a midamble pattern is created.

[0055] First, a reference block corresponding to the transmit power value determined by transmit power determining section 100 is selected using the table shown in FIG.11. Then, the midamble pattern having the selected reference block at the leading section thereof is selected as the midamble pattern to be inserted into this RACH signal. For example, in the case where the transmit power value is "P3", "C" is selected as the reference block, and therefore the "midamble pattern of channel 3" shown in FIG.10 is selected as the midamble pattern.

[0056] Here, in view that the chip length of the reference block corresponds to the length of the W-chip section of a delay profile created by the base station apparatus, the transmit power value and reference block in the table shown in FIG.11 are set as follows. That is, the W-chip section of the delay profile is set to be greater than a propagation delay which is estimated to occur when the RACH signal propagates through a propagation path estimated from a propagation loss, and any one of the reference blocks having a length equal to or greater than this W-chip section is selected.

[0057] According to this selection method, when a propagation loss between the mobile station apparatus and the base station apparatus is large or when the number of retransmissions of the RACH signal is large, a midamble pattern including a reference block with a large chip length is selected. On the contrary, when the propagation loss between the mobile station apparatus and the base station apparatus is small or when the number of retransmissions of the RACH signal is small, a midamble pattern including a reference block with a small chip length is selected. The midamble pattern selected as shown above is sent to time multiplexing section 102.

[0058] In time multiplexing section 102, the transmission data subjected to spreading processing and midamble patterns are multiplexed on frames, for example, as shown in FIG.12 to create transmission signals. FIG.12 is a schematic view showing transmission timing of mobile station apparatuses equipped with the transmission apparatus according to Embodiment 1 of the present invention.

[0059] That is, the transmission data subjected to spreading processing is inserted into the data section (here, data section 1 and data section 2) on the frames shown in FIG.12 and the midamble patterns are inserted into the midamble sections (512-chip sections) on the above-described frames to create transmission signals. The frames here are just shown by way of example and it is possible to change the positions of the midamble section and data sections as appropriate.

[0060] Radio section 104 performs predetermined transmission processing such as frequency conversion on the transmission signal created by time multiplexing section 102. Furthermore, the transmission signal subjected to the predetermined transmission processing above is sent as RACH signals from antenna 105. During this transmission, the transmit power value of the RACH signal is controlled to a transmit power value determined. by transmit power determining section 100.

[0061] The mobile station apparatus shown in FIG.8 sends the RACH signal requesting for the start of a communication in this way. After this, the mobile station apparatus monitors an FACH signal sent from the base station apparatus shown in FIG. 9 to check whether this FACH signal includes the ID number of the mobile station apparatus or not. When the request for a communication is accepted by the base station apparatus (the ID number of the mobile station apparatus is included in the FACH signal), the mobile station apparatus starts a normal communication with the base station apparatus. On the contrary, when the request for a communication is not accepted by the base station apparatus (the ID number of the mobile station apparatus is not included in the FACH signal), the mobile station apparatus resends the RACH signal. This completes the explanation about how the mobile station apparatus equipped with the transmission apparatus according to this embodiment operates.

[0062] Then, an operation of the base station apparatus equipped with the reception apparatus according to this embodiment will be explained with reference to FIG. 9. A received signal is sent to delay section 201 and matched filter 202. Delay section 201 delays the received signal by a predetermined time and sends the delayed signal to multiplication section 204.

[0063] Matched filter 202 carries out correlation value calculation processing using the midamble code section and the above-described cyclic basic code in the received signal, and thereby calculates a channel estimated value corresponding to each channel. Furthermore, applying a power calculation to the calculated channel estimated values obtains delay profiles as shown in FIG. 13. The calculated channel estimated values are sent to JD section 203.

[0064] FIG.13 is a schematic view showing an example of delay profiles created by the base station apparatus equipped with the reception apparatus according to Embodiment 1 of the present invention. As shown in FIG.13, the chip length of the reference block of the midamble pattern corresponds to the length of the W-chip section of the delay profile of the mobile station apparatus using this midamble pattern. For example, in the case of the mobile station apparatus using a midamble pattern of channel 4, the chip length of reference block "D" of this midamble pattern is "W4", and therefore a delay profile having a length of "W4" is created.

[0065] JD section 203 performs the following matrix calculation using the channel estimated values calculated by matched filter 202. That is, the length of the channel estimated value of each channel calculated by matched filter 202 is adjusted to the length of the longest channel estimated value (W7). More specifically, "0" is added to the end of channel estimated values of channels other than channel 7 as appropriate so that these estimated values have the same length as the length of the estimated value of channel 7. This is because, in this embodiment, the chip length of the reference block differs from one channel to another, as opposed to the conventional system in which the chip length of the reference block is common to all channels.

[0066] Then, by carrying out convolutional calculations between the channel estimated values whose length has been adjusted and spreading codes of data sections assigned to the respective channels, results (matrix) of convolutional calculations for the respective channels are obtained. Through these calculations, a matrix [A] is obtained in which the convolutional calculation results of the respective channels are regularly placed. Further, carrying out a matrix calculation shown in expression ① using system matrix [A] gives matrix [B] shown in expression②. Matrix [B] obtained through such a matrix calculation is sent to multiplication section 204.

[0067] Multiplication section 204 carries out multiplication processing (that is, interference elimination demodulation processing) between the data section of the received signal from delay section 201 and the matrix from JD section 203 and obtains data stripped of interference for the respective channels. Thus, the base station apparatus recognizes ID numbers of the mobile station apparatuses that have requested for the start of a communication, and thereby accepts these mobile station apparatuses as the mobile station apparatuses with which to communicate.

[0068] After such a random access communication, the base station apparatus sends a signal indicating that these mobile station apparatuses have been accepted via a forward access channel as an FACH signal. This completes the explanation about how the base station apparatus equipped with the reception apparatus according to this embodiment operates.

[0069] Then, the effects of the mobile station apparatus equipped with the transmission apparatus according to this embodiment and the base station apparatus equipped with the reception apparatus according to this embodiment will be explained more specifically in two cases; one case where the mobile station apparatus carries out a random access communication for the first time and the other case where the mobile station apparatus carries out a random access communication for a second time.

[0070] First, the case where the mobile station apparatus carries out a random access communication for the first time will be explained. In the mobile station apparatus, transmit power determining section 100 calculates a propagation loss using the received information channel signal and determines a transmit power value based on this propagation loss. As described above, the propagation loss can be uses as an index to indicate the condition of the propagation path between the mobile station apparatus and base station apparatus.
Furthermore, midamble pattern determination section 103 determines a reference block based on the transmit power value determined by transmit power determining section 100 and selects a midamble pattern having this reference block.

[0071] Therefore, it can be said that the midamble pattern determined by midamble pattern determining section 100 is selected taking into account the condition of the propagation path between the mobile station apparatus and base station apparatus.

[0072] More specifically, according to FIG.11, when the transmit power value is large (that is, a propagation loss during propagation between the mobile station apparatus and base station apparatus is large), a midamble pattern with a reference block of a large chip length is selected. That is, in this case, since the propagation delay of the RACH signal sent by the mobile station apparatus is estimated to increase, a midamble pattern with a reference block of a large chip length is selected to expand the W-chip section of the delay profile that can be created. This makes it possible to increase the probability that the delay profile of the mobile station apparatus will appear in the W-chip section corresponding to this mobile station apparatus. In other words, it is possible to decrease the probability that the delay profile of the mobile station apparatus will appear in the W-chip sections corresponding to other mobile station apparatuses.

[0073] On the contrary, when the transmit power value is small (that is, when a propagation loss during propagation between the mobile station apparatus and base station apparatus is small), a midamble pattern with a reference block of a small chip length is selected. That is, in this case, since the propagation delay of the RACH signal sent by the mobile station apparatus is estimated to decrease, a midamble pattern with a reference block of a small chip length is selected to reduce the W-chip section of the delay profile.

[0074] As described above, based on the transmit power value determined using the propagation loss, in other words, based on the condition of the propagation path between the mobile station apparatus and base station apparatus, a midamble pattern to be inserted into the RACH signal is selected so that the length of the W-chip section of the delay profile created by the base station apparatus exceeds the propagation delay. In the delay profile created by the base station apparatus, this makes it possible to increase the probability that the delay profile of a mobile station apparatus will appear in the expected W-chip section. Therefore, the base station apparatus can exactly extract channel estimated values corresponding to the respective mobile station apparatuses, and can thereby reduce the frequency with which RACH signals are retransmitted by the mobile station apparatuses.

[0075] Then, the case where the mobile station apparatus carries out a random access communication for a second time will be explained. For the above-described reason, this embodiment can reduce the frequency with which the mobile station apparatuses retransmit RACH signals. However, there are also cases where an RACH signal sent by a mobile station apparatus is not accepted by the base station apparatus and the mobile station apparatus resends the RACH signal.

[0076] Reasons for this can be: (1) Because the mobile station apparatus is located very far from the base station apparatus, the delay profile of this mobile station apparatus created by the base station apparatus does not appear in the expected W-chip section, (2) the transmit power value of the mobile station apparatus is too small with respect to the condition of the propagation path between the mobile station apparatus and base station apparatus, or (3) a mobile station has performed transmission using the same midamble as that of another mobile station apparatus simultaneously, causing the RACH signals to collide with each other, etc.

[0077] Thus, when the mobile station apparatus resends the RACH signal, transmit power determining section 100 further increases the transmit power value determined as described above according to the number of times the RACH signal is retransmitted. The increased transmit power value is sent to midamble pattern determining section 103 and radio section 104.

[0078] Midamble pattern determining section 103 determines a reference block based on the transmit power value increased by transmit power determining section 100 and selects a midamble pattern with this reference block. Furthermore, radio section 104 sends an RACH signal using the transmit power value increased by transmit power determining section 100.

[0079] Therefore, it can be said that the midamble pattern determined by midamble pattern determining section 103 has been selected taking into account not only the condition of the propagation path between the mobile station apparatus and base station apparatus but also the number of times the RACH signal is retransmitted.

[0080] More specifically, when the number of times RACH signals are retransmitted is large, a midamble pattern with a reference block of a larger chip length is selected and the RACH signal is transmitted with a larger transmit power value.

[0081] That is, in view that the propagation delay during transmission of the previous RACH signal exceeded the W-chip section of the delay profile, a midamble pattern having a reference block of a larger chip length is selected to expand the W-chip section of the delay profile. This makes it possible to increase the probability that the delay profile of the mobile station apparatus will appear in the W-chip section corresponding to this mobile station apparatus. At the same time, in view that the transmit power value of the previous RACH signal was too small with respect to the condition of the propagation path between the mobile station apparatus and base station apparatus, the transmit power value is also increased.

[0082] As described above, a midamble pattern to be inserted into the RACH signal is selected based on not only the condition of the propagation path between the mobile station apparatus and base station apparatus but also the number of times the RACH signal is retransmitted so that the length of the W-chip section of the delay profile created by the base station apparatus exceeds the propagation delay, and the transmit power value of the RACH signal is increased as well. This makes it possible to increase the probability that the delay profile of a certain mobile station apparatus will appear in the expected W-chip section in the delay profile created by the base station apparatus. Thus, the base station apparatus can exactly extract the channel estimated values corresponding to the respective mobile station apparatuses, and even if the RACH signal needs to be retransmitted for some reasons, it is possible to reduce the frequency with which the RACH signal is retransmitted thereafter by the mobile station apparatuses.

[0083] Thus, this embodiment selects a midamble pattern to be inserted into the RACH signal based on the condition of the propagation path between the mobile station apparatus and base station apparatus and the number of times the RACH signal is retransmitted so that the length of the W-chip section of the delay profile that can be created by the base station apparatus exceeds the propagation delay and increases the transmit power value of the RACH signal, and can thereby increase the probability that the delay profiles of the respective mobile station apparatuses will appear in the respective expected W-chip sections.

[0084] Furthermore, this embodiment uses a plurality of midamble patterns created using a basic code having a plurality of blocks with mutually different chip lengths and code contents, and can thereby prevent influences on the number of users that can be accommodated in JD and the transmission capacity.

[0085] Therefore, this embodiment can improve the probability that the communication terminal apparatus carrying out a random access communication will be accepted without affecting the number of communication terminal apparatuses that can be accommodated and transmission capacity.

[0086] In order to explain the most appropriate embodiment, this embodiment has described the case where a midamble pattern is set based on the condition of the propagation path and the number of times the RACH signal is retransmitted and the transmit power value of the RACH signals is set based on the condition of the propagation path and the number of times the RACH signal is retransmitted.

[0087] However, it goes without saying that even in the case where a midamble pattern is set based on either the condition of the propagation path or the number of times the RACH signal is retransmitted, it is possible to increase the probability that the delay profiles of the respective mobile station apparatuses will appear in their respective expected W-chip sections. In this case, it goes without saying that it is also possible to further improve the above probability by setting the transmit power value of an RACH signal based on at least one of the condition of the propagation path and RACH signal.

(Embodiment 2)

[0088] This embodiment will explain a case where when a delay profile of a certain mobile station apparatus according to Embodiment 1 does not appear in an expected W-chip section, deterioration of channel estimated values of other mobile station apparatuses will be prevented. The mobile station apparatus equipped with a transmission apparatus according to this embodiment and the base station apparatus equipped with a reception apparatus according to this embodiment will be explained below focused on differences from Embodiment 1 with reference to FIG.14 to FIG.16.

[0089] FIG.14 is a schematic view showing a procedure for creating midamble patterns used for mobile station apparatuses equipped with a transmission apparatus according to Embodiment 2 of the present invention. FIG.15 is a schematic view showing transmission timing of the mobile station apparatuses equipped with the transmission apparatus according to Embodiment 2 of the present invention. FIG.16 is a schematic view showing an example of delay profiles created by a base station apparatus equipped with a reception apparatus according to Embodiment 2 of the present invention.

[0090] The configurations of the mobile station apparatus equipped with the transmission apparatus according to this embodiment and the base station apparatus equipped with the reception apparatus according to this embodiment are the same as those according to Embodiment 1 except for the method of creating midamble patterns used, and therefore detailed explanations thereof will be omitted.

[0091] The method of creating midamble patterns to be assigned to the respective mobile station apparatuses will be explained with reference to FIG.14. In this embodiment, suppose the total number of midamble patterns is 8 as an example.

[0092] As shown in FIG.14, a midamble pattern used for each mobile station apparatus (channel) is created using a basic code that is repeated in a cycle of 456 chips (=8W) following the procedure shown below. This basic code includes 8 blocks "A" to "H" with mutually different codes and chip lengths and is known to the base station apparatus shown in FIG.9.

[0093] The basic code shown in FIG.14 is obtained by changing the basic code shown in FIG.10 as follows. That is, while the basic code shown in FIG.10 consists of blocks arranged in the order of "A" to "G" in such a way that the chip length increases from the 1st chip to the 456th chip, the basic code shown in FIG.14 consists of blocks arranged in the order of "A" to "H" so that a difference in a chip length between at least some adjacent blocks becomes as large as possible from the 1st chip to 456th chip. In other words, the basic code shown in FIG.14 includes a plurality of codes formed by a plurality of blocks with mutually different codes and code lengths (here codes "H", "D" to "F" "A" of a length of 456 chips).

[0094] As a first step, a reference block is set in the above-described basic code. Here, the reference block is assumed to be "A" as an example. As a second step, the phase of the above-described reference block is shifted leftward in the figure by 0, W1, W1+W6, ···, W1+W2+W3+W5+W6+W7, W1+W2+W3+W4+W5+W6+W7 (W1<W2<··· <W6<W7) for the respective channels (channels 1, 2, 3, ···, 7, 8). In this way, reference blocks of the respective channels (channels 1, 2, 3, ···, 7, 8) are "A", "F", "B", ···, "D", "H".

[0095] As a third step, for the respective channels, 512 chips are extracted from the leading section of the respective reference blocks whose phase has been shifted in the second step in the above basic code. Thus, a midamble pattern of 512 chips as a whole is created for each channel. FIG.14 shows midamble patterns of channels 1, 2, 3, 4 and 8.

[0096] Then, operations of the mobile station apparatus equipped with the transmission apparatus in the above configuration and the base station apparatus equipped with the reception apparatus in the above configuration during a random access communication will be explained.

[0097] The mobile station apparatus selects any one midamble pattern from a plurality of midamble patterns according to the content of the table shown in FIG.11 as in the case of Embodiment 1 and transmits an RACH signal with the selected midamble pattern inserted according to the frame shown in FIG.15.

[0098] The base station apparatus receives the RACH signal sent from the mobile station apparatus and creates a delay profile as in the case of Embodiment 1. At this time, an example of delay profiles created is shown in FIG.16. As is apparent from FIG. 16, the chip length of the reference block in the midamble pattern corresponds to the length of the W-chip section of the delay profile about the mobile station apparatus using this midamble pattern as in the case of Embodiment 1.

[0099] Then, the effects of the mobile station apparatus equipped with the transmission apparatus according to this embodiment and the base station apparatus equipped with the reception apparatus according to this embodiment will be explained using the delay profiles according to Embodiment 1 (FIG.13) in contrast to the delay profiles according to Embodiment 2 (FIG.16). Here, a case where mobile station apparatus 1 sends an RACH signal using a midamble pattern corresponding to channel 1 and the delay profile of mobile station apparatus 1 does not appear in the expected W-chip section at the base station apparatus will be explained as an example. In FIG.13 and FIG.16, suppose path 601 and path 602 are the paths in the delay profile of mobile station apparatus 1 (hereinafter simply referred to as "path of mobile station apparatus 1") and the phases of path 601 and path 602 are identical in FIG.13 and FIG. 16.

[0100] In FIG.13, path 601 and path 602 of mobile station apparatus 1 (channel 1) appear in the W-chip sections corresponding to channel 2 and channel 3. Thus, path 601 is detected as the channel estimated value of channel 2 and path 602 is detected as the channel estimated value of channel 3. As a result, not only the channel estimated value of channel 2 but also the channel estimated values of channel 2 and channel 3 degrade. Therefore, the interference elimination demodulation results of channels 1, 2 and 3 degrade.

[0101] On the other hand, in this embodiment, the above-described basic code consists of blocks "A" to "G" arranged so that a difference in a chip length between at least some adjacent blocks (for example, "A" and "F", "F" and "B", "B" and "G" and "G" and "C", etc.) becomes as large as possible. Thus, the length of the W-chip section corresponding to mobile station apparatus 1 (channel 1) using the midamble pattern with "A" as the reference block is "W1", while the length of the W-chip section corresponding to the mobile station apparatus (channel 2) using the midamble pattern with block "F" adjacent to "A" as the reference block is "W6".

[0102] Thus, in FIG.16, path 601 and path 602 of mobile station apparatus 1 (channel 1) only appear in the W-chip section corresponding to channel 2. Thus, path 601 and path 602 are detected as channel estimated values of channel 2. In this way, the channel estimated value of channel 2 degrades in the same way as Embodiment 1, whereas the channel estimated value of channel 3 does not degrade unlike Embodiment 1.

[0103] This embodiment describes the case where the mobile station apparatus sends an RACH signal using the midamble pattern corresponding to channel 1 as an example, but effects similar to those in the case above will also be obtained when the mobile station apparatus uses midamble patterns corresponding to other channels.

[0104] Here, when the mobile station apparatus uses a midamble pattern having a reference block of a large chip length (for example, "G"), this apparently produces inconvenience. That is, since the length of the chip section of W-chip section "5" adjacent to W-chip section "4" corresponding to this mobile station apparatus is small, if the propagation delay of the RACH signal sent from this mobile station apparatus is large as in the example above, the path corresponding to this mobile station apparatus seems to appear not only in W-chip section "5" but also in W-chip section "6". On the other hand, the length of W-chip section "4" corresponding to this mobile station apparatus itself is large, and it is less likely that the propagation delay produced as in the above example will exceed the sum total of W-chip section "4" and W-chip section "5".

[0105] Thus, according to this embodiment, midamble patterns are created so that the lengths of delay profiles of the respective channels become irregular, for example, a difference in the length of delay profile between at least some adjacent delay profiles becomes large. Furthermore, a midamble pattern to be inserted into an RACH signal is selected based on the condition of the propagation path between the mobile station apparatus and base station apparatus and the number of times the RACH signal is retransmitted so that the length of the W-chip section of the delay profile created by the base station apparatus exceeds the propagation delay and it is possible to increase the probability that the delay profiles of the respective mobile station apparatuses will appear in their respective expected W-chip sections by increasing the transmit power of the RACH signal.

[0106] Furthermore, the lengths of delay profiles between adjacent mobile station apparatuses vary even in the case where the mobile station apparatus that has carried out a random access communication is not accepted by the base station apparatus, and therefore it is possible to suppress the number of mobile station apparatuses that will be affected by the path corresponding to this mobile station apparatus. When the delay profile of a certain mobile station apparatus does not appear in the expected W-chip section, this makes it possible to prevent deterioration of channel estimated values about other mobile station apparatuses. Thus, it is possible to improve the probability that the mobile station apparatus will be accepted by the base station apparatus through a random access communication.

[0107] This embodiment has described the case using a basic code with blocks with mutually different chip lengths and codes arranged so that a difference in the chip length between at least some adjacent blocks becomes as large as possible. In other words, this embodiment has described the case where a plurality of midamble patterns is created so that the chip length of at least some adjacent blocks becomes as large as possible. However, the present invention is not limited to this, but is also applicable to a case where the procedure for creating a basic code or midamble pattern is changed under conditions under which the lengths of delay profiles between adjacent channels become irregular.

[0108] As described above, the present invention sets a known reference signal to be assigned to each communication terminal apparatus based on at least one of the condition of the propagation path and the number of times the random access channel signal is retransmitted, and can thereby improve the probability of successful random access communications without affecting the number of communication terminal apparatuses that can be accommodated and transmission capacity.

[0109] This application is based on the Japanese Patent Application No.2000-060155 filed on March 6, 2000, entire content of which is expressly incorporated by reference herein.

Industrial Applicability

[0110] The present invention is ideally applicable to a communication apparatus that cancels interference using matrix calculations in a CDMA-based communication, and more particularly, to the filed of a communication apparatus that cancels interference during a random access communication.

Claims

1. A transmission apparatus comprising:

   reference signal setting means for setting known reference signals to be inserted into random access channel signal based on the condition of propagation path; and
   transmitting means for transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

2. A transmission apparatus comprising:

   reference signal setting means for setting known reference signals to be inserted into random access channel signal based on the number of times the random access channel signal is retransmitted; and
   transmitting means for transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

3. The transmission apparatus according to claim 1, wherein the reference signal setting means uses any one of known reference signals created by extracting a predetermined length from the leading section of each block of a reference signal having a plurality of codes formed by sequentially placing a plurality of blocks with mutually different codes and code lengths according to said code lengths, as a known reference signal to be inserted in the random access channel signal.

4. The transmission apparatus according to claim 2, wherein the reference signal setting means uses any one of known reference signals created by extracting a predetermined length from the leading section of each block of a reference signal having a plurality of codes formed by sequentially placing a plurality of blocks with mutually different codes and code lengths according to said code lengths, as a known reference signal to be inserted in the random access channel signal.

5. The transmission apparatus according to claim 1, wherein the reference signal setting means uses any one of known reference signals created by extracting a predetermined length from the leading section of each block of a reference signal having a plurality of codes formed by irregularly and sequentially placing a plurality of blocks with mutually different codes and code lengths, as a known reference signal to be inserted in the random access channel signal.

6. The transmission apparatus according to claim 2, wherein the reference signal setting means uses any one of known reference signals created by extracting a predetermined length from the leading section of each block of a reference signal having a plurality of codes formed by irregularly and sequentially placing a plurality of blocks with mutually different codes and code lengths, as a known reference signal to be inserted in the random access channel signal.

7. The transmission apparatus according to claim 5, wherein the reference signal setting means uses a

second reference code having a plurality of codes formed by sequentially placing a plurality of blocks with mutually different codes and code lengths so that the code length between at least some adjacent blocks increases, as a reference code.

8. The transmission apparatus according to claim 6, wherein the reference signal setting means uses a second reference code having a plurality of codes formed by sequentially placing a plurality of blocks with mutually different codes and code lengths so that the code length between at least some adjacent blocks increases, as a reference code.

9. The transmission apparatus according to claim 1, further comprising power value setting means for setting a transmit power value based on at least one of the condition of the propagation path or the number of times the random access channel signal is retransmitted, wherein the transmitting means controls the transmission of said random access signal using the set transmit power value.

10. The transmission apparatus according to claim 2, further comprising power value setting means for setting a transmit power value based on at least one of the condition of the propagation path or the number of times the random access channel signal is retransmitted, wherein the transmitting means controls the transmission of said random access signal using the set transmit power value.

11. A reception apparatus comprising:

receiving means for receiving a random access channel signal sent from a transmission apparatus;
calculating means for calculating a channel estimated value by calculating a correlation value using the received signal and a reference signal;
joint detection calculating means for calculating joint detection using the calculated channel estimated value; and
demodulating means for extracting information on a request for the start of a communication from said transmission apparatus by carrying out demodulation processing using the result of said joint detection calculation and said received signal,

wherein said transmission apparatus comprises reference signal setting means for setting known reference signals to be inserted into the random access channel signal based on the condition of the propagation path; and transmitting means for transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

12. A reception apparatus comprising:

receiving means for receiving a random access channel signal sent from a transmission apparatus;
calculating means for calculating a channel estimated value by calculating a correlation value using the received signal and a reference signal;
joint detection calculating means for calculating joint detection using the calculated channel estimated value; and
demodulating means for extracting information on a request for the start of a communication from said transmission apparatus by carrying out demodulation processing using the result of said joint detection calculation and said received signal,

wherein said transmission apparatus comprises reference signal setting means for setting known reference signals to be inserted into the random access channel signal based on the number of times the random access channel signal is retransmitted; and
transmitting means for transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

13. A communication terminal apparatus equipped with a transmission apparatus, said transmission apparatus comprising:

reference signal setting means for setting known reference signals to be inserted into a random access channel signal based on the condition of the propagation path; and
transmitting means for transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

14. A communication terminal apparatus equipped with a transmission apparatus, said transmission apparatus comprising:

reference signal setting means for setting known reference signals to be inserted into a random access channel signal based on the number of times the random access channel signal is retransmitted; and
transmitting means for transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

15. A base station apparatus equipped with a reception apparatus comprising:

receiving means for receiving a random access channel signal sent from a transmission apparatus;
calculating means for calculating a channel estimated value by calculating a correlation value using the received signal and a reference signal;
joint detection calculating means for calculating joint detection using the calculated channel estimated value; and
demodulating means for extracting information on a request for the start of a communication from said transmission apparatus by carrying out demodulation processing using the result of said joint detection calculation and said received signal,

wherein said transmission apparatus comprises reference signal setting means for setting known reference signals to be inserted into the random access channel signal based on the condition of the propagation path and transmitting means for transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

16. A base station apparatus equipped with a reception apparatus comprising:

receiving means for receiving a random access channel signal sent from a transmission apparatus;
calculating means for calculating a channel estimated value by calculating a correlation value using the received signal and a reference signal;
joint detection calculating means for calculating joint detection using the calculated channel estimated value; and
demodulating means for extracting information on a request for the start of a communication from said transmission apparatus by carrying out demodulation processing using the result of said joint detection calculation and said received signal,

wherein said transmission apparatus comprises reference signal setting means for setting known reference signals to be inserted into the random access channel signal based on the number of times the random access channel signal is retransmitted and transmitting means for transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

17. A transmission method comprising:

a reference signal setting step of setting known reference signals to be inserted into a random access channel signal based on the condition of the propagation path; and
a transmitting step of transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

18. A transmission method comprising:

a reference signal setting step of setting known reference signals to be inserted into the random access channel signal based on the number of times a random access channel signal is retransmitted; and
a transmitting step of transmitting the random access channel signal in which the set known reference signals and information on a request for the start of a communication are inserted.

19. The transmission method according to claim 17, further comprising a power value setting step of setting a transmit power value based on at least one of the condition of the propagation path or the number of times the random access channel signal is retransmitted, wherein the transmitting step controls the transmission of said random access signal using the set transmit power value.

20. The transmission method according to claim 18, further comprising a power value setting step of setting a transmit power value based on at least one of the condition of the propagation path or the number of times the random access channel signal is retransmitted, wherein the transmitting step controls the transmission of said random access signal using the set transmit power value.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Dear Sir:

INTRODUCTORY COMMENTS

This is in response to the non-final Office Action dated July 2, 2007 (Paper No. 20070614), for which a response was due on October 2, 2007. Filed herewith is a Petition and fee for a three month extension of time, thereby extending the deadline for response to January 2, 2008 Accordingly, this response is timely filed. Reconsideration and allowance of the pending claims, as amended, in light of the remarks presented herein are respectfully requested.

Amendments to the Abstract begin on page 2.

Amendments to the Claims are reflected in the listing of claims which begins on page 3 of this paper.

Remarks/Arguments begin on page 14 of this paper.

AMENDMENTS TO THE ABSTRACT

Please replace the original abstract in its entirety with the following amended version:

A method, system and apparatus for setting a transmit power control level in a wireless communication system. Aspects of both open loop and closed loop transmit power control schemes are used to determine a transmit power level. A method includes measuring a power level of a received signal, receiving on a downlink channel an allocation of a scheduled uplink transmission resource and ~~a~~ transmit power control (TPC) commands. The method calculates ~~and calculating~~ a transmit power level associated with the scheduled uplink transmission resource based on the power level of the received signal and the TPC commands. The method also allows disregarding or utilizing the TPC commands when calculating the transmit power level, thereby disabling or exclusively enabling use of closed loop power control, and accordingly exclusively enabling or disabling the use of open loop power control.

AMENDMENTS TO THE CLAIMS

1. **(Currently amended)** A method of power control in a radio communications system, the method comprising:

determining a path loss for a radio channel between a base station and a remote transceiver; and

receiving on a downlink channel an allocation of a scheduled uplink transmission resource and [[~~a~~]]transmit power control (TPC) commands transmitted to the remote transceiver from the base station[[;]].

~~calculating a transmit power level for the remote transceiver based on the path loss and the TPC command.~~

2. **(Currently Amended)** The method of power control of claim 1, the method further comprising transmitting an uplink signal from the remote transceiver at ~~the~~ a calculated transmit power level.

3. **(Original)** The method of power control of claim 1, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

4. **(Original)** The method of power control of claim 3, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level.

5. **(Canceled)**

6. **(Canceled)**

7. **(Currently Amended)** The method of power control of claim 2 ~~6~~, wherein the ~~adjustment factor incorporates~~ calculated ~~the~~ transmit power level is based on a spreading factor parameter.

8. **(Currently Amended)** The method of power control of claim 2 ~~6~~, wherein the ~~adjustment factor incorporates~~ calculated transmit power level is based on parameters associated with a selected transport format parameter.

9. **(Currently Amended)** A method of power control in a radio communications system, the method comprising:

receiving a signal at a second transceiver transmitted from a first transceiver;

measuring a power level of the received signal at the second transceiver to obtain a measured received power level; and

receiving on a downlink channel an allocation of a scheduled uplink transmission resource and [[~~a~~]] transmit power control (TPC) commands at the second transceiver transmitted from the first transceiver[[~~;~~]]. ~~and~~

~~calculating a transmit power level for the second transceiver based on the power level of the received signal and the TPC command.~~

10. **(Currently Amended)** A method of uplink power control in a CDMA radio communications system, the method comprising:

receiving an uplink signal;

measuring a received ~~SNIR~~ signal quality measure of the uplink signal to obtain a measured received signal quality value ~~SNIR~~;

comparing the measured received ~~SNIR~~ signal quality value ~~of~~ with [[~~an~~]] a ~~SNIR~~ target signal quality value;

assigning a first value to a step indicator if the measured received ~~SNIR~~ signal quality value is greater than the ~~SNIR~~ target signal quality value, and assigning a second value to a step indicator if the measured received ~~SNIR~~ signal quality value is less than the ~~SNIR~~ target signal quality value;

transmitting a signal carrying both an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command instructing a transmitter to adjust an uplink transmit power level associated with the allocated uplink transmission resource based on the step indicator;

receiving the TPC command including the step indicator;

accumulating ~~the~~ step indicator values to obtain an accumulated step indicator value;

broadcasting a downlink signal including an indication of a downlink power level, wherein the downlink signal is transmitted at the downlink power level;

measuring ~~the~~ a received power level of the downlink signal; and

setting a transmit power level based on the received power level, the indication of the downlink power level, and the accumulated step indicator value.

11. **(Currently Amended)** The method of power control of claim 10, further comprising:

determining an error metric of the uplink signal;

updating the ~~SNIR~~ target signal quality value based on the error metric;

measuring an interference value in the received uplink signal; and

updating an interference measurement table with the interference value;

wherein broadcasting the downlink signal further includes the interference measurement table; and

wherein setting the transmit power level is further based on a value in the interference measurement table.

12. **(Currently Amended)** A method comprising:

measuring a power level of a received signal;

receiving on a downlink channel an allocation of a scheduled uplink transmission resource and [[~~a~~]] transmit power control (TPC) commands;

accumulating the TPC commands to obtain an accumulated TPC command; and

calculating a transmit power level associated with the scheduled uplink transmission resource based on the power level of the received signal and the accumulated TPC command.

13. **(Currently Amended)** A radio comprising:

a receiver including an output to provide a measured received power level and to receive an allocation of scheduled uplink transmission resource;

an accumulator having an input for accepting step increase and decrease instructions and an output providing an accumulated history of the step increases and decreases ~~sum of past step~~

~~instructions~~; and

a power level setting circuit coupled to the accumulator output and coupled to the receiver output, wherein the power level setting circuit sets a transmit power ~~bases~~ for the scheduled uplink transmission resource based on the accumulator output and the measured received power level to obtain a set transmit power,; and

a transmitter, ~~wherein the transmitter~~ configured to transmit[[~~s~~]] a signal on the scheduled uplink transmission resource at the set transmit power.

14. **(New)** The power control method of claim 1, wherein the TPC commands are transmitted on a shared physical channel.

15. **(New)** The power control method of claim 1, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command.

16. **(New)** The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

17. **(New)** The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

18. **(New)** The power control method of claim 9, further comprising calculating a transmit power level to use for transmission by the second transceiver on the scheduled uplink transmission

resource based on the power level of the received signal and an accumulated TPC command.

19. **(New)** The power control method of claim 18, further comprising receiving a signal from the first transceiver for instructing the second transceiver to utilize only the accumulated TPC command when calculating transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

20. **(New)** The power control method of claim 18, further comprising receiving a signal from the first transceiver for instructing the second transceiver to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

21. **(New)** The power control method of claim 9, wherein the downlink channel is a shared physical channel.

22. **(New)** The uplink power control method of claim 10, wherein the received signal quality measure comprises signal-to-noise plus interference ratio (SNIR).

23. **(New)** The method of claim 12, further comprising utilizing only the accumulated TPC command when calculating the transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

24. **(New)** The method of claim 12, further comprising disregarding the accumulated TPC command when calculating the transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

25. **(New)** The method of claim 12, wherein the downlink channel is a shared physical channel.

26. **(New)** A computer-readable medium comprising program code for controlling power in a radio communication system, the program code for:

determining a path loss for a radio channel between a base station and a remote transceiver; and

receiving on a downlink channel an allocation of scheduled uplink transmission resource and transmit power control (TPC) commands transmitted to the remote transceiver from the base station, wherein the TPC commands are generated by the base station by comparing a received signal quality measure to a target signal quality value.

27. **(New)** The computer-readable medium of claim 26, wherein the downlink channel is a shared physical channel.

28. **(New)** The computer-readable medium of claim 26, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

29. **(New)** The computer-readable medium of claim 26, further comprising program code for calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command to obtain a calculated transmit power level.

30. **(New)** The computer-readable medium of claim 29, further comprising program code for receiving a signal from the base station for instructing the remote transmitter to utilize the accumulated TPC command only when calculating the transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

31. **(New)** The computer-readable medium of claim 29, further comprising program code for receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when calculating the transmit power level, thereby disabling use of closed loop power control and enabling use of open loop power control only.

32. **(New)** The computer-readable medium of claim 29, further comprising program code for transmitting an uplink signal from the remote transceiver at the calculated transmit power level.

33. **(New)** The computer-readable medium of claim 29, wherein calculating the transmit power level is additionally based on a spreading factor parameter.

34. **(New)** The computer-readable medium of claim 29, wherein calculating the transmit power level is additionally based on parameters associated with a selected transport format parameter.

35. **(New)** A computer-readable medium comprising program code for controlling power in a radio communication system, the program code for:

receiving a signal at a second transceiver transmitted from a first transceiver;

measuring a power level of the received signal to obtain a measured received power level; and

receiving a downlink signal comprising an allocation of scheduled uplink transmission resources and transmit power control (TPC) commands at the second transceiver transmitted from the first transceiver.

36. **(New)** The computer-readable medium of claim 35, wherein the TPC commands are transmitted on a shared physical channel.

37. **(New)** The computer-readable medium of claim 35, further comprising program code for calculating a transmit power level to use for transmission by the second transceiver on the scheduled uplink resources based on the path loss and an accumulated TPC command.

38. **(New)** The computer-readable medium of claim 37, further comprising program code for receiving a signal from the first transceiver for instructing the second transceiver to utilize the accumulated TPC commands only when calculating the transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

39. **(New)** The computer-readable medium of claim 37, further comprising program code for receiving a signal from the first transceiver for instructing the second transceiver to disregard the accumulated TPC command when calculating the transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

40. **(New)** A computer-readable medium comprising program code for controlling uplink power in a CDMA radio communication system, the program code for:

receiving an uplink signal to obtain a received uplink signal;

measuring a received signal quality measure of the uplink signal to obtain a measured received signal quality value;

comparing the measured received signal quality value with a target signal quality value;

assigning a first value to a step indicator if the measured received signal quality value is greater than the target signal quality value, and assigning a second value to a step indicator if the measured received signal quality value is less than the target signal quality value;

transmitting a signal carrying an allocation of uplink transmission resource and a transmit power control (TPC) command instructing a transmitter to adjust an uplink transmit power level associated with the allocated uplink transmission resource based on the step indicator;

receiving the TPC command including the step indicator;

accumulating step indicator values to obtain an accumulated step indicator value;

broadcasting a downlink signal including an indication of a downlink power level, wherein the downlink signal is transmitted at the downlink power level;

measuring a received power level of the downlink signal; and

setting a transmit power level based on the received power level, the indication of the downlink power level, and the accumulated step indicator value.

41. **(New)** The computer-readable medium of claim 40, further comprising program code for:

determining an error metric of the uplink signal;

updating the target signal quality value based on the error metric;

measuring an interference value in the received uplink signal; and

updating an interference measurement table with the interference value;

wherein broadcasting the downlink signal further includes the interference measurement table; and

wherein setting the transmit power level is further based on a value in the interference measurement table.

42. **(New)** The computer-readable medium of claim 40, wherein the received signal quality measure comprises SNIR.

43. **(New)** A method of power control in a radio communications system, the method comprising:

sending on a downlink channel an allocation of a scheduled uplink transmission resource and transmit power control (TPC) commands transmitted to a remote transceiver from a base station; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC commands.

44. **(New)** The power control method of claim 43, further comprising sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

45. **(New)** The power control method of claim 43, further comprising sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

46. **(New)** A computer-readable medium comprising program code for controlling power in a radio communication system, the program code for:

sending on a downlink channel an allocation of a scheduled uplink transmission resource and transmit power control (TPC) commands transmitted to a remote transceiver from a base station;

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC commands.

47. **(New)** A computer-readable medium of claim 46, further comprising program code for sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

48. **(New)** A computer-readable medium of claim 46, further comprising program code for sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

REMARKS

In the July 02, 2007 Office Action, claims 1-13 were rejected. This Response amends claims 1-2, and 7-13, cancels claims 5 and 6 (without prejudice or disclaimer of the subject matter), and introduces new claims 14-48. No new matter has been introduced by the present amendments. After entry of the foregoing amendments, claims 1-4, and 7-48 (46 total claims; 10 independent claims) remain pending in the application. With respect to all amendments, Applicants have not dedicated or abandoned any unclaimed subject matter and moreover have not acquiesced to any rejections made by the Patent Office. Reconsideration of the application is respectfully requested in view of the above amendments and the following remarks.

Objection under 35 U.S.C. § 112

The Office action has rejected claim 13 under 35 U.S.C. § 112, first paragraph, as failing to comply with the written description requirement. Claim 13 has been amended to address the Examiner's rejection. Claim 13 now recites "an output providing an accumulated history of the step increases and decreases", which is enabled by at least paragraph 65 lines 4-5 of Applicants' application, which states "The UE accumulates the TPC commands and uses the accumulated TPC commands", and paragraph 59 lines 4-6 of Applicants' application, which states "step is the magnitude of the amount added to an accumulator upon receipt of each TPC command". Accordingly, Applicants request the withdrawal of the §112 rejection of claim 13.

Rejections under 35 U.S.C. § 102

The Office Action has rejected claims 1-7, 9, 10, 12, and 13, under U.S.C. § 102(b) as being anticipated by Zeira et al., International Application Publication No. (WO 00/57574) published September 28, 2000 (hereinafter "Zeira"). Applicants respectfully traverse the rejections.

Regarding independent claim 1, 9, and 12, Applicants teach a physical channel on the downlink that is used to carry fast allocation and scheduling information to a user thereby informing the user equipment (UE) of the uplink resources that it may use. Additionally this physical channel is used as a feedback channel for power control also carrying transmit power control (TPC) commands (paragraph 84 of Applicants' application). Accordingly independent claims 1, 9 and 12, recite "receiving on a downlink channel *an allocation of a scheduled uplink transmission resource* *and transmit power control (TPC) commands* transmitted to the remote transceiver from the base station". This feature, is not taught by Zeira, and therefore, Zeira does not anticipate the methods as recited in independent claims 1, 9, and 12.

Additionally, regarding independent claim 12, Applicants teach a power control algorithm based in part on *accumulated* TPC commands (paragraph 66, lines 5-6 of Applicants' application). Accordingly, claim 12 recites "calculating a transmit power level *associated with the scheduled uplink transmission resource* based on the power level of the received signal and the *accumulated TPC command'*. This feature, is not taught by Zeira, therefore for at least this additional reason, Zeira does not anticipate the method as recited in independent claim 12.

Regarding independent claim 10, applicant teaches a method for *carrying both an allocation of a scheduled uplink transmission resource and transmit power control (TPC) commands on a transmitting signal* for instructing a transmitter to adjust the uplink transmit power level associated with the *allocated uplink transmission resource* based on a step indicator. This feature, is not taught by Zeira, and therefore, Zeira does not anticipate the method as recited in the independent claim 10.

Regarding independent claim 13, Applicants teach a system for performing a power control algorithm using *accumulated* power control instructions. Accordingly, claim 13 recites "an *accumulator* having an input for accepting step increase and decrease instructions and an output providing an *accumulated* history of the step increases and decreases" (paragraph 74, and paragraph 59 lines 4-6 of Applicants' application). This feature and in particular the "*accumulated* history of the step increases and decreases" is not taught by Zeira, therefore, Zeira does not anticipate the method as recited in claim 13.

Furthermore, claim 13 recites "sets the transmit power *for the scheduled uplink transmission resource*" and "to transmit a signal *on the scheduled uplink transmission resource...*". This feature, is not taught by Zeira, therefore for this additional reason, Zeira does not anticipate the system as recited in independent claim 13.

For at least the above reasons, Zeira does not anticipate the method as recited in independent claims 1, 9-10, and 12 and the system as recited in independent claim 13. For at least the same reasons, claims 2-4, and 7 (which variously depend from claim 1), are also not anticipated by Zeira. Accordingly, Applicants request the withdrawal of the §102 rejection of claims 1-4, 7, 9-10, and 12-13. Claims 5-6 are cancelled, and therefore the rejections to claims 5-6 are now moot.

Rejections under 35 U.S.C. § 103

Applicant respectfully submits that the Office Action has not met all of the criteria to establish a case of obviousness.

Claim 8 was rejected under 35 U.S.C. § 103(a) as being allegedly unpatentable over Zeira in view of Zeira et al., U.S. Patent Application Publication No. (2004/0141483) published July 22, 2004 (hereinafter "Zeira US"), in view of Bevan et al., U.S. Patent Application Publication No. (2004/0162093) published Aug. 19, 2004 (hereinafter "Bevan"), and further in view of Kamel et al., U.S. Patent No. (7,190,688) issued Mar. 13, 2007 (hereinafter "Kamel"). Applicants respectfully traverse the rejections.

For the reasons discussed above, Zeira fails to teach or suggest the "receiving on a downlink channel *an allocation of scheduled uplink transmission resource and transmit power control (TPC) commands...*" limitations of independent claim 1, and consequently Zeira also fails to teach or suggest the same limitations in claim 8 (which depends from claim 1). For at least the above reasons, claim 8 is not unpatentable over Zeira in view of Zeira US, in view of Bevan, and further in view of Kamel, and Applicants respectfully request the withdrawal of the rejection of claim 8 under §103(a).

Claim 11 was rejected under 35 U.S.C. § 103(a) as being allegedly unpatentable over Zeira in view of Shiu et al., U.S. Patent No. (6,983,166) issued Jan. 3, 2006 (hereinafter "Shiu"). Applicants respectfully traverse the rejections.

For the reasons discussed above, Zeira fails to teach or suggest "*carrying both an allocation of a scheduled uplink transmission resource and transmit power control (TPC) commands on a transmitting signal...*" limitation in claim 10. Consequently Zeira also fails to teach or suggest the same limitation in claim 11 (which depends from claim 10). Therefore, for at least the above reasons, claim 11 is not unpatentable over Zeira in view of Shiu, and Applicants respectfully request the withdrawal of the rejection of claim 11 under §103(a).

New Claims

New claims 14-48 have been introduced and support for the new claims can be found throughout the application and particularly in paragraphs 73, 84 and 85 of the applicants' specification.

Abstract

The abstract has been amended to better reflect the Application. No new matter has been introduced by the present amendments.

Conclusion

In view of the above, each of the presently pending claims in this application is believed to be in immediate condition for allowance. Accordingly, the Examiner is respectfully requested to withdraw the outstanding rejection of the claims and to pass this application to issue. If it is determined that a telephone conference would expedite the prosecution of this application, the Examiner is invited to telephone the undersigned at the number given below.

In the event the U.S. Patent and Trademark office determines that an extension and/or other relief is required, Applicants' petition for any required relief including extensions of time and authorizes the Commissioner to charge the cost of such petitions and/or other fees due in connection with the filing of this document to Deposit Account No. 03-1952 referencing docket no.562492000500. However, the Commissioner is not authorized to charge the cost of the issue fee to the Deposit Account.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

<u>New Applications Under 35 U.S.C. 111</u>
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

<u>National Stage of an International Application under 35 U.S.C. 371</u>
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

<u>New International Application Filed with the USPTO as a Receiving Office</u>
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Approved for use through 12/31/2007. OMB 0651-0031
U.S. Patent and Trademark Office; U.S. DEPARTMENT OF COMMERCE

PETITION FOR EXTENSION OF TIME UNDER 37 CFR 1.136(a) FY 2008 *(Fees pursuant to the Consolidated Appropriations Act, 2005 (H.R. 4818).)*	Docket Number (Optional) 562492000500
Application Number 10/917,968	Filed August 12, 2004
For POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM	
Art Unit 2618	Examiner D. E. Rego

This is a request under the provisions of 37 CFR 1.136(a) to extend the period for filing a reply in the above identified application.

The requested extension and fee are as follows (check time period desired and enter the appropriate fee below):

		Fee	Small Entity Fee	
☐	One month (37 CFR 1.17(a)(1))	$120	$60	$
☐	Two months (37 CFR 1.17(a)(2))	$460	$230	$
X	Three months (37 CFR 1.17(a)(3))	$1050	$525	$ 1,050.00
☐	Four months (37 CFR 1.17(a)(4))	$1640	$820	$
☐	Five months (37 CFR 1.17(a)(5))	$2230	$1115	$

☐ Applicant claims small entity status. See 37 CFR 1.27.

☐ A check in the amount of the fee is enclosed.

☐ Payment by credit card. Form PTO-2038 is attached.

☐ The Director has already been authorized to charge fees in this application to a Deposit Account.

X The Director is hereby authorized to charge any fees which may be required, or credit any overpayment, to Deposit Account Number 03-1952 ~~I have enclosed a duplicate copy of this sheet. Fee Transmittal form (PTO/SB/17) is attached to this submission in duplicate.~~

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

I am the

☐ applicant/inventor.

☐ assignee of record of the entire interest. See 37 CFR 3.71.
Statement under 37 CFR 3.73(b) is enclosed. (Form PTO/SB/96).

X attorney or agent of record. Registration Number 57,740

☐ attorney or agent under 37 CFR 1.34.
Registration number if acting under 37 CFR 1.34 ____________

/Elahe Toosi/	December 28, 2007
Signature	Date
Elahe Toosi	(858) 314-7546
Typed or printed name	Telephone Number

NOTE: Signatures of all the inventors or assignees of record of the entire interest or their representative(s) are required. Submit multiple forms if more than one signature is required, see below.

X Total of 1 forms are submitted.

PTO/SB/06 (12-04)
Approved for use through 7/31/2006. OMB 0651-0032
U.S. Patent and Trademark Office; U.S. DEPARTMENT OF COMMERCE
Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

PATENT APPLICATION FEE DETERMINATION RECORD
Substitute for Form PTO-875

Application or Docket Number: 10/917,968

APPLICATION AS FILED – PART I

FOR	NUMBER FILED (Column 1)	NUMBER EXTRA (Column 2)	SMALL ENTITY RATE ($)	SMALL ENTITY FEE ($)	OR	OTHER THAN SMALL ENTITY RATE ($)	OTHER THAN SMALL ENTITY FEE ($)
BASIC FEE (37 CFR 1.16(a), (b), or (c))							
SEARCH FEE (37 CFR 1.16(k), (i), or (m))							
EXAMINATION FEE (37 CFR 1.16(o), (p), or (q))							
TOTAL CLAIMS (37 CFR 1.16(i))	minus 20 =	*	X =		OR	X =	
INDEPENDENT CLAIMS (37 CFR 1.16(h))	minus 3 =	*	X =			X =	
APPLICATION SIZE FEE (37 CFR 1.16(s))	If the specification and drawings exceed 100 sheets of paper, the application size fee due is $250 ($125 for small entity) for each additional 50 sheets or fraction thereof. See 35 U.S.C. 41(a)(1)(G) and 37 CFR 1.16(s).						
MULTIPLE DEPENDENT CLAIM PRESENT (37 CFR 1.16(j))							
			TOTAL			TOTAL	

* If the difference in column 1 is less than zero, enter "0" in column 2.

APPLICATION AS AMENDED – PART II

12/28/07

AMENDMENT A		CLAIMS REMAINING AFTER AMENDMENT (Column 1)		HIGHEST NUMBER PREVIOUSLY PAID FOR (Column 2)	PRESENT EXTRA (Column 3)	SMALL ENTITY RATE ($)	ADDITIONAL FEE ($)	OR	OTHER THAN SMALL ENTITY RATE ($)	ADDITIONAL FEE ($)
	Total (37 CFR 1.16(i))	* 46	Minus	** 20	= 26	x25 =		OR	x50 =	1,300.00
	Independent (37 CFR 1.16(h))	* 10	Minus	*** 5	= 5	x100 =		OR	x200 =	1,050.00
	Application Size Fee (37 CFR 1.16(s))									
	FIRST PRESENTATION OF MULTIPLE DEPENDENT CLAIM (37 CFR 1.16(j))							OR		
						TOTAL ADD'L FEE		OR	TOTAL ADD'L FEE	2,350.00

AMENDMENT B		CLAIMS REMAINING AFTER AMENDMENT (Column 1)		HIGHEST NUMBER PREVIOUSLY PAID FOR (Column 2)	PRESENT EXTRA (Column 3)	SMALL ENTITY RATE ($)	ADDITIONAL FEE ($)	OR	OTHER THAN SMALL ENTITY RATE ($)	ADDITIONAL FEE ($)
	Total (37 CFR 1.16(i))	*	Minus	**	=	X =		OR	X =

ART UNIT	PAPER NUMBER
2618	

MAIL DATE	DELIVERY MODE
03/19/2008	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.	Applicant(s)	
	10/917,968	ANDERSON, NICHOLAS WILLIAM	
	Examiner	Art Unit	
	DOMINIC E. REGO	2618	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE *1* MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *28 December 2007*.

2a)☐ This action is **FINAL**. 2b)☐ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-4 and 7-48* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☐ Claim(s) _____ is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☒ Claim(s) *1-4 and 7-48* are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☐ Notice of References Cited (PTO-892)

4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date. _____ .
5) ☐ Notice of Informal Patent Application
6) ☐ Other: _____.

DETAILED ACTION

1. This communication is responsive to application filed on December 28, 2007. Claims 1-4 and 7-48 are pending.

Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C. 121:

I. Claims 1-4,7-9,12,14-21,23-39, and 43-48 drawn to determining a path loss for a radio channel between a base station and a remote transceiver, measuring a power level of the received signal at the second transceiver to obtain a measure received power level and receiving on a downlink channel an allocation of a scheduled uplink transmission resource, classified in class 455, subclass 522.

II. Claims 10,11,22,and 40-42 drawn to measuring a received signal quality measure of the uplink signal to obtain a measured received signal quality value, comparing the measured received signal quality value with a target quality value and assigning a first value to a step indication if the measured received signal quality value is greater than target signal quality value, and assigning a second value to a step indicator if the measured received signal quality value is less than target signal quality value, classified in class 455, subclass 115.3 or 135.

III. Claim 13 drawn to an accumulator having an input for accepting step increase and decrease instructions and an output providing an accumulated history of the step increases and decreases, a power level circuit setting circuit coupled to the accumulator output and couple to the receiver output, where the power level setting circuit sets a transmit power for the scheduled uplink transmission resource based on the accumulator output and the measured power level to obtain a set transmit power, classified in class 455, subclass 522.

2. The inventions are distinct, each from the other because of the following reasons:

Subcombination-Usable Together

3. Inventions I, II, and III are related as subcombinations disclosed as usable together in a single combination. The subcombinations are distinct if they do not overlap in scope and are not obvious variants, and if it is shown that at least one subcombination is separately usable. In the instant case, inventions I and II are related as subcombination II has separate utility such as measuring a received signal quality measure of the uplink signal to obtain a measured received signal quality value, comparing the measured received signal quality value with a target quality value and assigning a first value to a step indication if the measured received signal quality value is greater than target signal quality value, and assigning a second value to a step indicator if the measured received signal quality value is less than target signal quality value. Inventions I and III are related as subcombination III has separate utility such as

an accumulator having an input for accepting step increase and decrease instructions and an output providing an accumulated history of the step increases and decreases, a power level circuit setting circuit coupled to the accumulator output and couple to the receiver output, where the power level setting circuit sets a transmit power for the scheduled uplink transmission resource based on the accumulator output and the measured power level to obtain a set transmit power. Inventions I and III are related as subcombination III has separate utility such as an accumulator having an input for accepting step increase and decrease instructions and an output providing an accumulated history of the step increases and decreases, a power level circuit setting circuit coupled to the accumulator output and couple to the receiver output, where the power level setting circuit sets a transmit power for the scheduled uplink transmission resource based on the accumulator output and the measured power level to obtain a set transmit power. See MPEP § 806.05(d).

4. Because these inventions are independent or distinct for the reasons given above and have acquired a separate status in the art in view of their different classification, restriction for examination purposes as indicated is proper.

5. Because these inventions are independent or distinct for the reasons given above and the inventions require a different field of search (see MPEP § 808.02), restriction for examination purposes as indicated is proper.

6. Because these inventions are independent or distinct for the reasons given above and have acquired a separate status in the art because of their recognized divergent subject matter, restriction for examination purposes as indicated is proper.

Applicant is advised that the reply to this requirement to be complete must include (i) an election of a species or invention to be examined even though the requirement be traversed (37 CFR 1.143) and (ii) identification of the claims encompassing the elected invention.

The election of an invention or species may be made with or without traverse. To reserve a right to petition, the election must be made with traverse. If the reply does not distinctly and specifically point out supposed errors in the restriction requirement, the election shall be treated as an election without traverse.

Should applicant traverse on the ground that the inventions or species are not patentably distinct, applicant should submit evidence or identify such evidence now of record showing the inventions or species to be obvious variants or clearly admit on the record that this is the case. In either instance, if the examiner finds one of the inventions unpatentable over the prior art, the evidence or admission may be used in a rejection under 35 U.S.C.103(a) of the other invention.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DOMINIC E. REGO whose telephone number is

(571)272-8132. The examiner can normally be reached on Monday-Friday, 8:30 am-5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew D. Anderson can be reached on 571-272-4177. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

For: POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM	Examiner: D. Rego

RESPONSE TO RESTRICTION REQUIREMENT

MS Amendment
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Dear Sir:

This is in response to the restriction requirement dated March 19, 2008 for which a response is due by April 19, 2008. Accordingly, this response is timely filed.

Restriction has been required as between the following allegedly distinct groups of inventions:

Group I. Claims-1-4, 7-9, 12, 14-21, 23-39, and 43-48 drawn to determining a path loss for a radio channel between a base station and a remote transceiver, measuring power level of the received signal at the second transceiver to obtain a measure received power level and receiving a downlink channel on allocation of a scheduled uplink transmission resource, classified in class 455, subclass 522.

Group II. Claims 10, 11, 22 and 40-42 drawn to measuring a received signal quality measure of the uplink signal to obtain a measured received signal quality value, comparing the measured received signal quality value with a target quality value and assigning a fist value to a step indication if the measured received signal quality value is greater than target signal quality value and assigning a second value to a step indicator if the measured received signal quality value is less than target signal quality value, classified in class 455, subclass 115.3 or 135.

Group III. Claim 13 drawn to an accumulator having an input for accepting step increase and decrease instructions and an output providing an accumulated history of the step increases and decreases, a power level circuit setting circuit coupled to the accumulator output and couple to the receiver output, where the power level setting circuit sets a transmit power for the scheduled uplink transmission resource based on the accumulator output and the measured power level to obtain a set transmit power, classified in class 455, subclass 522.

Applicant hereby provisionally elects Group I (claims 1-4, 7-9, 12, 14-21, 23-39, and 43-48) without traverse. Applicant expressly reserve their rights under 35 U.S.C. § 121 to file a divisional application directed to the nonelected subject matter during the pendency of this application, or an application claiming priority from this application.

In the unlikely event that the transmittal form is separated from this document and the Patent Office determines that an extension and/or other relief is required, Applicant petitions for any required relief including extensions of time and authorize the Commissioner to charge the cost of such petitions and/or other fees due in connection with the filing of this document to **Deposit Account No. 03-1952** referencing Docket No. 562492000500. However, the Commissioner is not authorized to charge the cost of the issue fee to the Deposit Account.

Dated: April 11, 2008

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

	DOMINIC E. REGO	2618	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on 11 April 2008.

2a)☒ This action is **FINAL**. 2b)☐ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *4,7-9,11,12,14-21,23-39 and 43-48* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *4,7-9,11,12,14-21,23-39 and 43-48* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)

5) ☐ Notice of Informal Patent Application

6) ☐ Other: _____.

DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

> The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 8,12,15-17,18,19,20,23,24,26-39, and 44-48 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. **Regarding claim 12**, Applicant recites limitations "calculating a transmit power level associated with the scheduled uplink transmission resource based on the power level of the received signal and the accumulated TPC command". The underlining parts are not found in the specification. In the specification, paragraph 0088, recites "calculates a transmit power level based on the power level of the received signal and the TPC command" which are not same as above claimed limitations. "accumulating the TPC commands to obtain an accumulated TPC command" means more than one TPC command according to claim 12, but paragraph 0088 states "the UE measures a power level of a received signal, receives a TPC command, and calculates a transmit power level based on the power level of the received signal and the TPC command" which is a single command. Again, recited limitations in claim 12, "calculating a transmit power level associated with the scheduled uplink transmission resource" are a new matter and the Examiner can't find in the specification. **Regarding claim 8**, recited limitations "calculating transmit power level is based on parameter associated with a selected transport format parameter" are not same as in the specification, paragraph 0060 which states "an optional auxiliary process in the UE adjusts the transmit power based upon: (a) gamma (SF), the spreading factor (SF) of the physical channel; and (b) beta (TFC), the selected transport format (TFC). These paragraph (0060) is same as original dependent claim 8. **Regarding claim 15**, Applicant recites limitations "The power control method of claim l, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command". The underlining parts are not found in the specification. The limitations "an accumulated TPC command" means more than one command, but in the specification, paragraph 0014 states "calculating a transmit power level for the remote transceiver based on the path loss and the TPC command (one command) are not same as above claimed limitations. **Regarding claims 16,19,23,30,38,44, and 47**, Applicant recites limitations "The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only". The underlining parts are not found in the specification. Paragraph 0087 in the specification recites "a Node-B or RNC may be implemented with a new parameter, either included in a signalling command or a broadcast message, where the new parameter instructs a UE to enable or disable the setting of uplink transmit power level based on both the path loss estimation and the TPC commands. A parameter may indicate whether a UE is to use open loop power control, closed loop power control or a combined scheme" which are not same as above claimed limitations. **Regarding claims 17,20,24,31,39,45, and 48**, Applicant recites limitations "The power control method of claim 15, further comprising receiving a signal from the base station for <u>instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control</u>". The underlining parts are not found in the specification. Paragraph 0087 in the specification recites "a Node-B or RNC may be implemented with a new parameter, either included in a signalling command or a broadcast message, where the new parameter instructs a UE to enable or disable the setting of uplink transmit power level based on both the path loss estimation and the TPC commands. A parameter may indicate whether a UE is to use open loop power control, closed loop power control or a combined scheme" which are not same as above claimed limitations. **Regarding claims 26-39 and 46-48**, Applicant recites the limitations "A computer-readable medium comprising program code for controlling power in a radio communication system, the program code for" is not found in the Specification. Paragraph 0026, recites "Some portions of the detailed description which follows are presented in terms of procedures, steps, logic blocks, processing, and other symbolic representations of operations on <u>data bits that can be performed on computer memory. A procedure, computer executed step, logic block, process etc., are here conceived to be a self-consistent sequence of</u>

<u>steps or instructions leading to a desired result.</u> The steps are those utilizing physical manipulations of physical quantities. These quantities can take the form of electrical, magnetic, or radio signals capable of being stored, transferred, combined, compared, and otherwise manipulated in a computer system. These signals may be referred to at times as bits, values, elements, symbols, characters, terms, numbers, or the like. Each step may be performed by hardware, software, firmware, or combinations thereof" which are not same as above claimed limitations.

Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

> Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

3. Claims 26-39 and 46-48 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. Since the claimed "A computer-readable medium comprising program code for controlling power in a radio communication system" is not necessarily encoded or embodied or stored on the computer readable medium, there is <u>no</u> interrelationship between the claimed medium with the rest of the computer to permit the program's functionality to be realized. Thus, claims 26-39 and 46-48 are non-statutory.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

5. Claims 1-4,7,9,12,15,18,26,28,29,32,33,35,37,43, and 46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056).

Regarding claim 1, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising:

determining a path loss of a radio channel between a base station and a remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);

transmit power control (TPC) command transmitted to the remote transceiver from the base station (Page 4, line 17-Page 5, line 8) except for receiving on a downlink channel an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches receiving on a downlink channel an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches* *the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a <u>downlink dedicated control channel (DCCH)</u>. Paragraph 0052, Chen teaches the resource allocating unit 14 is <u>configured to allocate a radio resource which is used in uplink packet communications</u> with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Regarding claims 2 and 32, the combination of Zeira and Chen teach all the claimed elements in claims 1 and 29. In addition, Zeira teaches the method of power control, the method further comprising transmitting an uplink signal from the remote transceiver at a calculated transmit power level (Page 5, lines 4-8).

Regarding claims 3 and 28, the combination of Zeira and Chen teach all the claimed elements in claims 1 and 26. In addition, Zeira teaches the method of power control, wherein determining the path loss includes: receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and measuring a received power level of the downlink signal (Page 2, lines 14-21; Page 4, lines 17-page 8).

Regarding claim 4, the combination of Zeira and Chen teach all the claimed elements in claim 1. In addition, Zeira teaches the method of power control, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level (Page 2, lines 1-lines 21; Page 5, lines 2-lines 4).

Regarding claims 7 and 33, the combination of Zeira and Chen teach all the claimed elements in claims 1 and 29. In addition, Zeira teaches the method of power control, wherein the calculated the transmit power level is based on a spreading factor parameter (Page 13, lines 2-15).

Regarding claim 9, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising:

receiving a signal at a second transceiver (UE 32) transmitted from a first transceiver (base station 30) (Page 2, lines 14-17; Page 4, lines 18-20);

measuring a power level of the received signal at the second transceiver to obtain a measured received power level *(Page 2, lines 14-18: Zeira teaches the UE 32 receives the reference communication and measures its received power level)*;

transmit power control (TPC) command at the second transceiver transmitted from the first transceiver (Page 4, line 17-Page 5, line 8), except for receiving on a downlink channel an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches receiving on a downlink channel an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the* *resource allocating 14 to the mobile station via a* *__downlink dedicated control channel (DCCH)__. Paragraph 0052, Chen teaches the resource allocating unit 14 is* *__configured to allocate a radio resource which is used in uplink packet communications__ with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Regarding claim 12, as best understood by 112 1st, Zeira teaches a method comprising:

measuring a power level of a received signal (Page 2, lines 14-18);

receiving a transmit power control (TPC) commands (Page 4, line 18-Page 5, line 1; Claims 1, lines 9-18);

accumulating the TPC commands to obtain an accumulated TPC command *(Abstract; Page 4, line 18-Page 5, line 1; Claims 1, lines 9-18, especially, Claim 1, lines 9-10, Zeira teaches receiving at the second communication station (mobile terminal) the first communication (base station) and the power commands (more than one command). Once mobile terminal receives the power commands from the base station, it accumulates to obtain an accumulated TPC command, so it's obvious)*; and

calculating a transmit power level associated with the scheduled uplink transmission resource based on the power level of the received signal and the accumulated TPC command (Page 4, line 18-Page 5, line 8), except for receiving on a downlink channel an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches receiving on a downlink channel an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Regarding claims 15,18, and 37, the combination of Zeira and Chen teach all the claimed elements in claims 1,9, and 37. In addition, Zeira teaches the power control method, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command (Page 4, line 17-Page 5, line 8).

Regarding claim 26, Zeira teaches a computer-readable medium comprising program code for controlling power in a radio communication system, the program code for:

determining a path loss for a radio channel between a base station and a remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);

and

transmit power control (TPC) commands transmitted to the remote transceiver from the base station (Page 4, line 17-Page 5, line 8), wherein the TPC commands are generated by the base station by comparing a received signal quality (SIR) measure to a target signal quality value (Page 7, lines 9-15), except for receiving on a downlink channel an allocation of scheduled uplink transmission resource.

However, in related art, Chen teaches receiving on a downlink channel an allocation of scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a <u>downlink dedicated control channel (DCCH)</u>. Paragraph 0052, Chen teaches the resource allocating unit 14 is <u>configured to allocate a radio resource which is used in uplink packet communications</u> with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Regarding claim 29, the combination of Zeira and Chen teach all the claimed elements in claim 26. In addition, Zeira teaches the computer-readable medium, further comprising program code for calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command to obtain a calculated transmit power level (Page 2, lines 14-21; Page 4, lines 17-page 8).

Regarding claim 35, Zeira teaches a computer-readable medium comprising program code for controlling power in a radio communication system (See Abstract), the program code for:

receiving a signal at a second transceiver (UE 32) transmitted from a first transceiver (base station 30) (Page 2, lines 14-17; Page 4, lines 18-20);

measuring a power level of the received signal to obtain a measured received power level *(Page 2, lines 14-18: Zeira teaches the UE 32 receives the reference communication and measures its received power level)*; and

transmit power control (TPC) commands at the second transceiver transmitted from the first transceiver (Page 4, line 17-Page 5, line 8), except for receiving a downlink signal comprising an allocation of scheduled uplink transmission resources.

However, in related art, Chen teaches receiving on a downlink channel an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057,* *especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a <u>downlink dedicated control channel (DCCH)</u>. Paragraph 0052, Chen teaches the resource allocating unit 14 is <u>configured to allocate a radio resource which is used in uplink packet communications</u> with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Regarding claim 43, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising:

sending transmit power control (TPC) commands transmitted to a remote transceiver from a base station (Page 4, line 17-Page 5, line 8); and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC commands (Page 2, lines 14-21; Page 4, lines 17-page 8), except for sending on a downlink channel an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches sending on a downlink channel an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057,* *especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Regarding claim 46, Zeira teaches a computer-readable medium comprising program code for controlling power in a radio communication system (See Abstract),, the program code for:

sending transmit power control (TPC) commands transmitted to a remote transceiver from a base station (Page 4, line 17-Page 5, line 8);

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC commands (Page 2, lines 14-21; Page 4, lines 17-page 8), except for sending on a downlink channel an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches sending on a downlink channel an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a <u>downlink dedicated control channel (DCCH)</u>. Paragraph 0052, Chen teaches the resource allocating unit 14 is <u>configured to allocate a radio resource which is used in uplink packet communications</u> with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

6. Claims 8 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) and further in view of Shiu et al. (US Patent #6,983,166).

Regarding claims 8 and 34, as best understood 112 1st, Zeira fails to teach the method of power control, wherein the calculated transmit power level is based on parameter associated with a selected transport format parameter.

However, in related art, Shiu teaches the method of power control, wherein the calculated transmit power level is based on parameter associated with a selected transport format parameter. (Col 3, lines 27-41).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Shiu to Zeira and Chen in order to achieve target block error rate (BLERs) (See Shiu, Col 3, line 31).

7. Claims 14,21,25,27, and 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) and further in view of Chen et al. (US Pub. No. 2003/0134655).

Regarding claims 14,21,25,27, and 36, the combination of Zeira and Chen et al. (US Pub. No. 2005/0025056) fail to teach the power control method, wherein the TPC commands are transmitted on a shared physical channel.

However, in related art, Chen et al. (US Pub. No. 2003/0134655) teaches the power control method, wherein the TPC commands are transmitted on a shared physical channel (Claims 1-5).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen et al. (US Pub. No. 2003/0134655) to Zeira and Chen et al. (US Pub. No. 2005/0025056) in order to enable communication services in an existing cellular communication system infrastructure.

8. Claims 16,17,19,20,23,24,30,31,38,39,44,45,47, and 48 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) and further in view of Krishnan et al. (US Pub. No. 2005/0176455).

Regarding claims 16,19,23,30,38,44, and 47, the combination of Zeira and Chen fail to teach the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

However, in related art, Krishnan teaches the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only (Paragraphs 0047-0050, especially, Paragraphs 0049-0050).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Krishnan to Zeira and Chen in order to provide the transmitting terminal feedback regarding the power of signals received at the receiving terminal.

Regarding claim 17,20,24,31,39,45, and 48, the combination of Zeira and Chen fail to teach the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

However, in related art, Krishnan teaches the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control (Paragraphs 0047-0050, especially, Paragraphs 0049-0050).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Krishnan to Zeira and Chen in order to provide the transmitting terminal feedback regarding the power of signals received at the receiving terminal.

Response to Arguments

9. Applicant's arguments with respect to claims 1-4,7-9,12,14-21,23-39, and 43-48 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP

§ 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DOMINIC E. REGO whose telephone number is (571)272-8132. The examiner can normally be reached on Monday-Friday, 8:30 am-5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew D. Anderson can be reached on 571-272-4177. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

AMENDMENT AFTER FINAL ACTION UNDER 37 C.F.R. 1.116

MS AF
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Dear Sir:

INTRODUCTORY COMMENTS

This is in response to the final Office Action dated August 1, 2008 (Paper No. 20080722), for which a response was due on November 1, 2008. Filed herewith is a Petition and fee for a two-month extension of time, thereby extending the deadline for response to January 1, 2009. Accordingly, this response is timely filed. Reconsideration and allowance of the pending claims, as amended, in light of the remarks presented herein are respectfully requested.

Amendments to the Claims are reflected in the listing of claims which begins on page 2 of this paper.

Remarks/Arguments begin on page 6 of this paper.

AMENDMENTS TO THE CLAIMS

1. (Currently amended): A method of power control in a radio communications system, the method comprising:

determining a path loss for a radio channel between a base station and a remote transceiver; and

~~receiving on a downlink~~ on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command ~~commands transmitted to the remote transceiver from the base station~~; and

calculating, at the remote transceiver, a transmit power level for the scheduled uplink transmission resource based upon the path loss and the TPC command.

2. (Currently amended): The method of power control of claim 1, the method further comprising transmitting an uplink signal from the remote transceiver at ~~a~~ the calculated transmit power level.

3. (Original): The method of power control of claim 1, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

4. (Original): The method of power control of claim 3, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level.

5-6. (Canceled)

7. (Original): The method of power control of claim 2, wherein the calculated transmit power level is based on a spreading factor parameter.

8. (Currently amended): The method of power control of claim 2, wherein the calculated transmit power level is based on parameters associated with a selected transport format ~~parameter~~.

9. – 14. (Canceled)

15. (Previously presented): The power control method of claim 1, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command.

16. (Previously presented): The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

17. (Previously presented): The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

18.- 25. (Canceled)

26. (Currently amended): A computer-readable medium ~~comprising program code~~ encoded with a computer program for controlling power in a radio communication system, the ~~program code~~ computer program comprising instructions for:

determining a path loss for a radio channel between a base station and a remote transceiver; and

~~receiving on a downlink~~ on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command ~~commands transmitted to the remote transceiver from the base station, wherein the TPC commands are generated by the base station by comparing a received signal quality measure to a target signal quality value~~; and

calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command.

27. (Canceled)

28. (Previously presented): The computer-readable medium of claim 26, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

29. (Canceled)

30. (Currently amended): The computer-readable medium of claim 29, the computer program further comprising ~~program code~~ instructions for receiving a signal from the base station for instructing the remote transmitter to utilize the accumulated TPC command only when calculating the transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

31. (Currently amended): The computer-readable medium of claim 29, the computer program further comprising ~~program code~~ instructions for receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when calculating the transmit power level, thereby disabling use of closed loop power control and enabling use of open loop power control only.

32. (Currently amended): The computer-readable medium of claim 29, the computer program further comprising ~~program code~~ instructions for transmitting an uplink signal from the remote transceiver at the calculated transmit power level.

33. (Previously presented): The computer-readable medium of claim 29, wherein calculating the transmit power level is additionally based on a spreading factor parameter.

34. (Currently amended): The computer-readable medium of claim 29, wherein calculating the transmit power level is additionally based on parameters associated with a selected transport format ~~parameter~~.

35.-42. (Canceled)

43. (Currently amended): A method of power control in a radio communications system, the method comprising:

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending ~~on a downlink channel~~ an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command ~~commands transmitted to the remote transceiver from the base station~~; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC ~~commands~~ command.

44. (Previously presented): The power control method of claim 43, further comprising sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby instructing

the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

45. (Previously presented): The power control method of claim 43, further comprising sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

46. (Currently amended): A computer-readable medium ~~comprising program code~~ encoded with a computer program for controlling power in a radio communication system, the ~~program code~~ computer program comprising instructions for:

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending ~~on a downlink channel~~ an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command ~~commands transmitted to the remote transceiver from the base station~~; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC ~~commands~~ command.

47. (Currently amended): A computer-readable medium of claim 46, the computer program further comprising ~~program code~~ instructions for sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

48. (Currently amended): A computer-readable medium of claim 46, the computer program further comprising ~~program code~~ instructions for sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

REMARKS

Claims 1-4, 7-9, 11, 12, 14-21, 23-39, and 43-48 were rejected. By virtue of this Response, claims 1, 2, 8, 26, 30-32, 34, 43, and 46-48 are amended. Claims 5-6, 9-14, 18-25, 27, 29, and 35-42 are canceled. Claims 1-4, 7, 8, 15-17, 26, 28, 30-34, and 43-48 remain pending.

I. Rejections under 35 U.S.C § 112

In the final Office Action, claims 8, 12, 17, 18, 19, 20, 23, 24, 26-39 and 44-48 were rejected under 35 U.S.C. §112, first paragraph, as allegedly failing to comply with the written description requirement.

MPEP 2163(I)(B) requires that new or amended claims be "supported in the specification through express, implicit, or inherent disclosure." The same section goes on to state that "[t]he fundamental factual inquiry is whether the specification conveys with reasonable clarity to those skilled in the art that ... applicant was in possession of the invention as now claimed."

A. Claim 12

Claim 12 is canceled.

B. Claim 8

Applicant respectfully submits that support for amended claim 8 can be found in at least paragraphs 0060 and 0061. In part, these paragraphs support setting the transmit power based on the selected transport format. The term "transport format" is commonly understood by those skilled in the art of wireless communications and is also of particular relevance to 3GPP UTRA systems such as those referred to by, for example, paragraphs 0033, 0034 and 0035. Thus, at least the combination of these paragraphs "conveys with reasonable clarity to those skilled in the art that ... applicant was in possession of the invention as now claimed." Therefore, Applicant respectfully asserts that amended claim 8 complies with the written description requirement of 35 U.S.C. 112, first paragraph.

C. Claim 15

Applicant respectfully submits that support for claim 15 can be found in at least paragraphs 0047, 0061, 0067, 0068, and 0076. In part, these paragraphs support setting the transmit power based on accumulating TPC commands and "convey[] with reasonable clarity to those skilled in the art that ... applicant was in possession of the invention as now claimed." Therefore, Applicant respectfully asserts that amended claim 15 complies with the written description requirement of 35 U.S.C. 112, first paragraph.

D. Claims 16, 19, 23, 30, 38, 44, and 47

Applicant respectfully submits that support for claim 16, 30, 44, and 47 can be found in at least paragraph 0087. These claims, in part, recite "utiliz[ing] only the accumulated TPC commands . . . thereby disabling use of open loop power control and enabling use of closed loop power control only." Paragraph 0087 states that "[a] parameter may indicate whether a UE is to use open loop power control, closed loop power control or a combined scheme." Throughout the specification, closed loop power control is described as using TPC commands. Thus, paragraph 0087 inherently supports that when open loop power control is not used, only TPC commands are used to implement the close loop power control. This paragraph "conveys with reasonable clarity to those skilled in the art that ... applicant was in possession of the invention as now claimed." Therefore, Applicant respectfully asserts that amended claim 16, 30, 44, and 47 complies with the written description requirement of 35 U.S.C. 112, first paragraph.

E. Claims 17, 20, 24, 31, 39, 45, and 48

Applicant respectfully submits that support for claim 17, 31, 45, and 48 can be found in at least paragraph 0087. These claims, in part, recite "disregard[ing] the accumulated TPC commands . . . thereby enabling use of open loop power control only and disabling use of closed loop power control." Paragraph 0087 states that "[a] parameter may indicate whether a UE is to use open loop power control, closed loop power control or a combined scheme." Throughout the specification, closed loop power control is described as using TPC commands whereas open loop power control does not rely on TPC commands. Thus, paragraph 0087 inherently supports that when closed loop power control is not used, TPC commands are ignored. This paragraph "conveys with reasonable clarity to those skilled in the art that … applicant was in possession of the invention as now claimed." Therefore, Applicant respectfully asserts that amended claim 17, 31, 45, and 48 complies with the written description requirement of 35 U.S.C. 112, first paragraph.

F. Claims 26-39 and 46-48

Applicant respectfully submits that support for claim 26, 28, 30-34, and 46-48 can be found in at least paragraph 0026. These claims recite, in part, "a computer-readable medium encoded with a computer program." Paragraph 0026 states that each step of the claims "may be performed by hardware, software, firmware, or combinations thereof." This paragraph "conveys with reasonable clarity to those skilled in the art that … applicant was in possession of the invention as now claimed." Therefore, Applicant respectfully asserts that amended claims 26, 28, 30-34, and 46-48 comply with the written description requirement of 35 U.S.C. 112, first paragraph.

II. Rejections under 35 U.S.C. § 101

Claims 26, 28, 30-34, and 46-48 were rejected under 35 U.S.C. 101 as being directed towards non-statutory subject matter. MPEP 2106.01(I) states that "a computer-readable medium encoded with a computer program … [is] statutory." Claims 26, 28, 30-34, and 46-48 recite "a computer-readable medium encoded with a computer program." Therefore, Applicant respectfully asserts that amended claims 26, 28, 30-34, and 46-48 are statutory subject matter under 35 U.S.C. 101.

III. Rejections under 35 U.S.C. § 103(a)

A. Claims 1-4, 7, 9, 12, 15, 18, 26, 28, 29, 32, 33, 35, 37, 43 and 46

Claims 1-4, 7, 9, 12, 15, 18, 26, 28, 29, 32, 33, 35, 37, 43 and 46 were rejected under 35 U.S.C. §103(a) as being unpatentable over International Publication Number WO 00/57574 (Zeira) in view of US Pub. No. 2005/0025056 (Chen).

Amended independent claims 1, 26, 43, and 46 recite utilizing a "shared physical channel used to carry allocation scheduling information" for sending and receiving "an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command." Thus, TPC commands and allocations of scheduled uplink transmission resources are sent and received together on a shared physical channel.

Zeira discloses TPC commands that are sent on dedicated control channels. (Page 8, lines 7-8.) By sending TPC commands on dedicated channels, the transmission of TPC commands can be maintained at a specific rate. (Page 12, lines 11-13.)

Chen discloses allocating resources "via a downlink dedicated control channel (DCCH)." (¶ 0054.) Allocations for resources are given based on the number of packets that need to be transmitted from a particular mobile station. (¶¶ 0034-0035.) Therefore, the rate at which resource allocations are made will vary depending on the number of packets the mobile station needs to send and whether other mobile stations need to send packets. (¶ 0109.)

In the final Office Action, the Examiner states that it would have been obvious to combine Zeira and Chen to send TPC commands and allocations of scheduled uplink transmission resources together. However, Applicant submits that it is not obvious to combine Zeira and Chen.

In Chen, allocations are sent sporadically because they are based on the dynamic status of multiple mobile stations. Typically, as suggested by Zeira, TPC commands would be transmitted using a dedicated channel and at a constant rate to maintain power control feedback. Thus, the problem of the intermittent nature of uplink transmissions and appropriate control of their transmission power (as referred to, for example, in paragraphs 0051, 0053, 0054, 0075 of the current application) is not recognized or addressed by Zeira. Additionally, neither Zeira nor Chen recognizes or addresses the signaling efficiency benefits of the amended independent claims by transmitting TPC commands together with scheduling information to a user on an allocation scheduling channel, as described in paragraphs 0085 and 0086 of the current application. Thus, the requirement of a constant rate of TPC commands in Zeira teaches against sending TPC commands with the sporadic allocations of resources in Chen.

Even if Zeira and Chen were combined, the combination only suggests and teaches a system with uplink scheduling on one channel and a separate dedicated channel with a constant update rate for conveying TPC commands. Applicant respectfully submits that a combination of Zeira and Chen does not result in the same power control feedback signaling efficiency of the amended independent claims. Thus, transmitting TPC commands and allocations of scheduled uplink transmission resources together is not obvious in view of Zeira and Chen.

Therefore, Applicant respectfully asserts that independent claims 1, 26, 43, and 46 are allowable over the cited references for at least the reason that it is not obvious to combine Zeira and Chen to transmit "allocations of scheduled uplink transmission resources [with] a transmit power control (TPC) command," as recited by the amended independent claims. Furthermore, Applicant respectfully asserts that claims, 2-4, 7, 15, 28, 32, and 33, which variously depend on independent claims 1 and 26, are allowable for at least the reason that they depend on allowable independent claims.

B. <u>Claims 8 and 34</u>

Claims 8 and 34 were rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira in view of Chen and further in view of US Patent 6,983,166 (Shiu).

Applicant respectfully asserts that claims, 8 and 34, which depend on independent claims 1 and 25, respectively, are allowable for at least the reason that they depend on allowable independent claims.

C. <u>Claims 14, 21, 25, 27 and 36</u>

Claims 14, 21, 25, 27 and 36 are rejected under 35 U.S.C. §103(a) as being unpatentable over Zeira in view of Chen and further in view of US Pub. No. 2003/0134655 (Chen03).

Claims 14, 21, 25, 27, and 36 have been canceled.

D. Claims 16, 17, 19, 20, 23, 24, 30, 31, 38, 39, 44, 45, 47 and 48

Claims 16, 17, 19, 20, 23, 24, 30, 31, 38, 39, 44, 45, 47 and 48 are rejected under 35 U.S.C. §103(a) as being unpatentable over Zeira, Chen and further in view of US Pub. No. 2005/0176455 (Krishnan).

Applicant respectfully asserts that claims, 16, 17, 30, 31, 44, 45, 47, and 48, which variously depend on independent claims 1, 26, 43, and 46, are allowable for at least the reason that they depend on allowable independent claims.

IV. Conclusion

In view of the above, each of the presently pending claims in this application is believed to be in immediate condition for allowance. Accordingly, the Examiner is respectfully requested to withdraw the outstanding rejection of the claims and to pass this application to issue. If it is determined that a telephone conference would expedite the prosecution of this application, the Examiner is invited to telephone the undersigned at the number given below.

In the event the U.S. Patent and Trademark office determines that an extension and/or other relief is required, applicant petitions for any required relief including extensions of time and authorizes the Commissioner to charge the cost of such petitions and/or other fees due in connection with the filing of this document to Deposit Account No. 03-1952 referencing docket no. 562492000500. However, the Commissioner is not authorized to charge the cost of the issue fee to the Deposit Account.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

PETITION FOR EXTENSION OF TIME UNDER 37 CFR 1.136(a) **FY 2009** ***(Fees pursuant to the Consolidated Appropriations Act, 2005 (H.R. 4818).)***	Docket Number (Optional) 562492000500
Application Number 10/917,968	Filed August 12, 2004
For POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM	
Art Unit 2618	Examiner D. E. Rego

This is a request under the provisions of 37 CFR 1.136(a) to extend the period for filing a reply in the above identified application.

The requested extension and fee are as follows (check time period desired and enter the appropriate fee below):

		Fee	Small Entity Fee	$
☐	One month (37 CFR 1.17(a)(1))	$130	$65	$
X	Two months (37 CFR 1.17(a)(2))	$490	$245	$ 490.00
☐	Three months (37 CFR 1.17(a)(3))	$1110	$555	$
☐	Four months (37 CFR 1.17(a)(4))	$1730	$865	$
☐	Five months (37 CFR 1.17(a)(5))	$2350	$1175	$

☐ Applicant claims small entity status. See 37 CFR 1.27.

☐ A check in the amount of the fee is enclosed.

☐ Payment by credit card. Form PTO-2038 is attached.

☐ The Director has already been authorized to charge fees in this application to a Deposit Account.

X The Director is hereby authorized to charge any fees which may be required, or credit any overpayment, to Deposit Account Number 03-1952 .

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

I am the

☐ applicant/inventor.

☐ assignee of record of the entire interest. See 37 CFR 3.71.
Statement under 37 CFR 3.73(b) is enclosed. (Form PTO/SB/96).

X attorney or agent of record. Registration Number 36,910

☐ attorney or agent under 37 CFR 1.34.
Registration number if acting under 37 CFR 1.34 ________

AMENDMENT AFTER FINAL ACTION UNDER 37 C.F.R. 1.116

MS AF
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Dear Sir:

INTRODUCTORY COMMENTS

This is in response to the final Office Action dated August 1, 2008 (Paper No. 20080722), for which a response was due on November 1, 2008. Filed herewith is a Petition and fee for a two-month extension of time, thereby extending the deadline for response to January 1, 2009. Accordingly, this response is timely filed. Reconsideration and allowance of the pending claims, as amended, in light of the remarks presented herein are respectfully requested.

Amendments to the Claims are reflected in the listing of claims which begins on page 2 of this paper.

Remarks/Arguments begin on page 6 of this paper.

EXAMINER	
REGO, DOMINIC E	

ART UNIT	PAPER NUMBER
2618	

MAIL DATE	DELIVERY MODE
01/09/2009	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Advisory Action Before the Filing of an Appeal Brief	**Application No.** 10/917,968	**Applicant(s)** ANDERSON, NICHOLAS WILLIAM	
	Examiner DOMINIC E. REGO	**Art Unit** 2618	

--The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

THE REPLY FILED 23 December 2008 FAILS TO PLACE THIS APPLICATION IN CONDITION FOR ALLOWANCE.

1. ☒ The reply was filed after a final rejection, but prior to or on the same day as filing a Notice of Appeal. To avoid abandonment of this application, applicant must timely file one of the following replies: (1) an amendment, affidavit, or other evidence, which places the application in condition for allowance; (2) a Notice of Appeal (with appeal fee) in compliance with 37 CFR 41.31; or (3) a Request for Continued Examination (RCE) in compliance with 37 CFR 1.114. The reply must be filed within one of the following time periods:

a) ☒ The period for reply expires 3 months from the mailing date of the final rejection.

b) ☐ The period for reply expires on: (1) the mailing date of this Advisory Action, or (2) the date set forth in the final rejection, whichever is later. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of the final rejection.

Examiner Note: If box 1 is checked, check either box (a) or (b). ONLY CHECK BOX (b) WHEN THE FIRST REPLY WAS FILED WITHIN TWO MONTHS OF THE FINAL REJECTION. See MPEP 706.07(f).

Extensions of time may be obtained under 37 CFR 1.136(a). The date on which the petition under 37 CFR 1.136(a) and the appropriate extension fee have been filed is the date for purposes of determining the period of extension and the corresponding amount of the fee. The appropriate extension fee under 37 CFR 1.17(a) is calculated from: (1) the expiration date of the shortened statutory period for reply originally set in the final Office action; or (2) as set forth in (b) above, if checked. Any reply received by the Office later than three months after the mailing date of the final rejection, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

NOTICE OF APPEAL

2. ☐ The Notice of Appeal was filed on _____. A brief in compliance with 37 CFR 41.37 must be filed within two months of the date of filing the Notice of Appeal (37 CFR 41.37(a)), or any extension thereof (37 CFR 41.37(e)), to avoid dismissal of the appeal. Since a Notice of Appeal has been filed, any reply must be filed within the time period set forth in 37 CFR 41.37(a).

AMENDMENTS

3. ☒ The proposed amendment(s) filed after a final rejection, but prior to the date of filing a brief, will not be entered because
   (a) ☒ They raise new issues that would require further consideration and/or search (see NOTE below);
   (b) ☐ They raise the issue of new matter (see NOTE below);
   (c) ☐ They are not deemed to place the application in better form for appeal by materially reducing or simplifying the issues for appeal; and/or
   (d) ☐ They present additional claims without canceling a corresponding number of finally rejected claims.

   NOTE: *Applicant added more limitations to claims 1,26, and 43 which require more search or consideration because it wasn't cited before*. (See 37 CFR 1.116 and 41.33(a)).
4. ☐ The amendments are not in compliance with 37 CFR 1.121. See attached Notice of Non-Compliant Amendment (PTOL-324).
5. ☐ Applicant's reply has overcome the following rejection(s): _____.
6. ☐ Newly proposed or amended claim(s) _____ would be allowable if submitted in a separate, timely filed amendment canceling the non-allowable claim(s).
7. ☒ For purposes of appeal, the proposed amendment(s): a) ☒ will not be entered, or b) ☐ will be entered and an explanation of how the new or amended claims would be rejected is provided below or appended.
   The status of the claim(s) is (or will be) as follows:
   Claim(s) allowed: _____.
   Claim(s) objected to: _____.
   Claim(s) rejected: *1-4,7,8,15-17,26,28,30-34,43-48*.
   Claim(s) withdrawn from consideration: _____.

AFFIDAVIT OR OTHER EVIDENCE

8. ☐ The affidavit or other evidence filed after a final action, but before or on the date of filing a Notice of Appeal will not be entered because applicant failed to provide a showing of good and sufficient reasons why the affidavit or other evidence is necessary and was not earlier presented. See 37 CFR 1.116(e).
9. ☐ The affidavit or other evidence filed after the date of filing a Notice of Appeal, but prior to the date of filing a brief, will not be entered because the affidavit or other evidence failed to overcome all rejections under appeal and/or appellant fails to provide a showing a good and sufficient reasons why it is necessary and was not earlier presented. See 37 CFR 41.33(d)(1).
10. ☐ The affidavit or other evidence is entered. An explanation of the status of the claims after entry is below or attached.

REQUEST FOR RECONSIDERATION/OTHER

11. ☐ The request for reconsideration has been considered but does NOT place the application in condition for allowance because: _____.
12. ☐ Note the attached Information *Disclosure Statement*(s). (PTO/SB/08) Paper No(s). _____
13. ☐ Other: _____.

This is a Request for Continued Examination (RCE) under 37 CFR 1.114 of the above-identified application.
Request for Continued Examination (RCE) practice under 37 CFR 1.114 does not apply to any utility or plant application filed prior to June 8, 1995, or to any design application. See Instruction Sheet for RCEs (not to be submitted to the USPTO) on page 2.

1. Submission required under 37 CFR 1.114 Note: If the RCE is proper, any previously filed unentered amendments and amendments enclosed with the RCE will be entered in the order in which they were filed unless applicant instructs otherwise. If applicant does not wish to have any previously filed unentered amendment(s) entered, applicant must request non-entry of such amendment(s).
   a. [X] Previously submitted. If a final Office action is outstanding, any amendments filed after the final Office action may be considered as a submission even if this box is not checked.
      i. [ ] Consider the arguments in the Appeal Brief or Reply Brief previously filed on ______
      ii. [X] Other Amendment filed December 23, 2008.
   b. [X] Enclosed
      i. [ ] Amendment/Reply
      ii. [ ] Affidavit(s)/Declaration(s)
      iii. [ ] Information Disclosure Statement (IDS)
      iv. [X] Other Petition for Extension of Time
2. Miscellaneous
   a. [ ] Suspension of action on the above-identified application is requested under 37 CFR 1.103(c) for a period of ______ months. (Period of suspension shall not exceed 3 months; Fee under 37 CFR 1.17(i) required)
   b. [ ] Other ______
3. Fees The RCE fee under 37 CFR 1.17(e) is required by 37 CFR 1.114 when the RCE is filed.
   a. [X] The Director is hereby authorized to charge the following fees, any underpayment of fees, or credit any Overpayments, to Deposit Account No. 03-1952 .
      i. [X] RCE fee required under 37 CFR 1.17(e)
      ii. [X] Extension of time fee (37 CFR 1.136 and 1.17)
      iii. [ ] Other ______
   b. [ ] Check in the amount of $ ______ enclosed
   c. [ ] Payment by credit card (Form PTO-2038 enclosed)

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

SIGNATURE OF APPLICANT, ATTORNEY, OR AGENT REQUIRED			
Signature	Robert Saltzberg	Date	1/27/09

PETITION FOR EXTENSION OF TIME UNDER 37 CFR 1.136(a) FY 2009 *(Fees pursuant to the Consolidated Appropriations Act, 2005 (H.R. 4818).)*	Docket Number (Optional) 562492000500
Application Number 10/917,968	Filed August 12, 2004
For POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM	
Art Unit 2618	Examiner D. E. Rego

This is a request under the provisions of 37 CFR 1.136(a) to extend the period for filing a reply in the above identified application.

The requested extension and fee are as follows (check time period desired and enter the appropriate fee below):

		Fee	Small Entity Fee	$
☐	One month (37 CFR 1.17(a)(1))	$130	$65	$
☐	Two months (37 CFR 1.17(a)(2))	$490	$245	$
☒	Three months (37 CFR 1.17(a)(3))	$1110	$555	$ 1,110.00
☐	Four months (37 CFR 1.17(a)(4))	$1730	$865	$
☐	Five months (37 CFR 1.17(a)(5))	$2350	$1175	$

☐ Applicant claims small entity status. See 37 CFR 1.27.

☐ A check in the amount of the fee is enclosed.

☐ Payment by credit card. Form PTO-2038 is attached.

☐ The Director has already been authorized to charge fees in this application to a Deposit Account.

☒ The Director is hereby authorized to charge any fees which may be required, or credit any overpayment, to Deposit Account Number 03-1952 .

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

I am the ☐ applicant/inventor.

☐ assignee of record of the entire interest. See 37 CFR 3.71.
Statement under 37 CFR 3.73(b) is enclosed. (Form PTO/SB/96).

☒ attorney or agent of record. Registration Number 36,910

☐ attorney or agent under 37 CFR 1.34.
Registration number if acting under 37 CFR 1.34 ____________

Robert Saltzberg — 1/27/09
Signature — Date

Robert A. Saltzberg — (415) 268-6428
Typed or printed name — Telephone Number

NOTE: Signatures of all the inventors or assignees of record of the entire interest or their representative(s) are required. Submit multiple forms if more than one signature is required, see below.

☒ Total of 1 forms are submitted.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

<u>New Applications Under 35 U.S.C. 111</u>
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

<u>National Stage of an International Application under 35 U.S.C. 371</u>
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

<u>New International Application Filed with the USPTO as a Receiving Office</u>
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.	Applicant(s)	
	10/917,968	ANDERSON, NICHOLAS WILLIAM	
	Examiner	Art Unit	
	DOMINIC E. REGO	2618	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE *3* MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *27 January 2009*.

2a)☐ This action is **FINAL**. 2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-4,7,8,15-17,26,28,30-34 and 43-48* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-4,7,8,15-17,26,28,30-34 and 43-48* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO/SB/08) Paper No(s)/Mail Date _____.
4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date. _____ .
5) ☐ Notice of Informal Patent Application
6) ☐ Other: _____.

DETAILED ACTION

1. This communication is responsive to the application filed on January 27, 2009.

Claims 1-4,7-8,15-17,26-,28,30-34, and 43-48 are pending and presented for prosecution.

Claims 1,8,26,30-32,34,43, and 45-48 have been amended.

Continued Examination Under 37 CFR 1.114

2. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 01/27/2009 has been entered.

Claim Rejections - 35 USC § 101

3. 35 U.S.C. 101 reads as follows:

> Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

4. Claims 26-39 and 46-48 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 26-39 and 46-48 recite “A computer-readable medium”. The claimed “a computer-readable medium “ is defined by the specification as “hardware, software, firmware, or combinations thereof” (See Paragraph [0026]). Since the claimed “ a computer-readable medium” may be softer which is not tangible, the claimed invention is directed to not-statutory subject matter. Further, in the specification, paragraph 0026, recites “A procedure, computer executed step, logic block, process etc., are here conceived to be a self-consistent sequence of steps or instructions leading to a desired result. The steps are those utilizing physical manipulations of physical quantities. <u>These quantities can take the form of electrical, magnetic, or radio signals capable of being stored, transferred, combined, compared, and otherwise manipulated in a computer system. These signals may be referred to at times as bits, values, elements, symbols, characters, terms, numbers, or the like</u>”. So treating claim 26-39 and 46-48 as a whole, it is effectively claiming a signal. Signal does not within any of the statutory categories, thus, not statutory (See MPEP 2100, In re Nuitjen, Docket no. 2006-1371 (Fed. Cir. Sept 20, 2007)(slip. Op. at 18)).

5. Claims 1-4,7,8,15-17, and 43-45 are rejected under 35 U.S.C. 101 as not falling within one of the four statutory categories of invention. Supreme Court precedent (*Diamond v. Diehr*, 450 U.S. 175, 184 (1981); *Parker v. Flook*, 437 U.S. 584,588 n.9 (1978); *Gottschalk v. Benson*, 409 U.S. 63, 70 (1972); *Cochrane v. Deener*, 94 U.S. 780, 787-88 (1876)) and recent Federal Circuit decisions (*In re Bilski*, 88 USPQ2d 1385 (Fed. Cir. 2008)) indicate that a statutory "process" under 35 U.S.C. 101 must (1) be tied to another statutory category (such as a particular apparatus), or (2) transform

underlying subject matter (such as an article or material) to a different state or thing. While the instant claim recites a series of steps or acts to be performed, the claim neither transforms underlying subject matter nor is positively tied to another statutory category that accomplishes the claimed method steps, and therefore does not qualify as a statutory process. In this case, a method of claims 1 and 43 including steps of determining, sending, receiving, and calculating is of sufficient breadth that it would be reasonably interpreted as a series of steps completely performed mentally, verbally or without a machine.

Claim Objections

6. Claims 30-34 are objected to because of the following informalities: claims 30-34 are currently depending on cancelled claim 29. Appropriate correction is required.

Claim Rejections - 35 USC § 103

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

8. Claims 1-4,7,15,26,28,32,33,43, and 46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) and further in view of Van Lieshout et al. (US Pub. No. 2001/0036823).

Regarding claim 1, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising:

determining a path loss of a radio channel between a base station and a remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);

receiving a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

calculating, at the remote transceiver, a transmit power level for the scheduled uplink transmission resource based upon the path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

The combination of Zeira and Chen fail to teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (Para. 0006). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claims 2 and 32, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the method of power control, the method further comprising transmitting an uplink signal from the remote transceiver at a calculated transmit power level (Page 5, lines 4-8).

Regarding claims 3 and 28, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claims 1 and 26. In addition, Zeira teaches the method of power control, wherein determining the path loss includes: receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and measuring a received power level of the downlink signal (Page 2, lines 14-21; Page 4, lines 17-page 8).

Regarding claim 4, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the method of power control, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level (Page 2, lines 1-lines 21; Page 5, lines 2-lines 4).

Regarding claims 7 and 33, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the method of power control, wherein the calculated the transmit power level is based on a spreading factor parameter (Page 13, lines 2-15).

Regarding claim 15, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the power control method, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command (Page 4, line 17-Page 5, line 8).

Regarding claim 26, Zeira teaches a computer-readable medium encoded with a computer program for controlling power in a radio communication system, the computer program comprising instructions for:

determining a path loss for a radio channel between a base station and a remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);

and

receiving a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

The combination of Zeira and Chen fail to teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (Para. 0006). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 43, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising:

sending transmit power control (TPC) commands (Page 4, line 17-Page 5, line 8); and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen* *teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a* *<u>downlink dedicated control channel (DCCH)</u>*. *Paragraph 0052, Chen teaches the resource allocating unit 14 is* *<u>configured to allocate a radio resource which is used in uplink packet communications</u>* *with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

The combination of Zeira and Chen fail to teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (Para. 0006). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 46, Zeira teaches a computer-readable medium <u>encoded with a computer program</u> for controlling power in a radio communication system (See Abstract), the <u>computer program comprising instructions for:</u>

sending a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level)*, but fails to teach on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the* *mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

The combination of Zeira and Chen fail to teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (Para. 0006). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

9. Claims 8 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) in view of Van Lieshout et al. (US Pub. No. 2001/0036823) and further in view of Shiu et al. (US Patent #6,983,166).

Regarding claims 8 and 34, the combination of Zeira, Chen, and Van Lieshout fails to teach the method of power control, wherein the calculated transmit power level is based on parameter associated with a selected transport format.

However, in related art, Shiu teaches the method of power control, wherein the calculated transmit power level is based on parameter associated with a selected transport format. (Col 3, lines 27-41).Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Shiu to Zeira, Chen, and Van Lieshout in order to adjust transmit power and achieve target block error rate (BLERs) (See Shiu, Col 3, line 31).

10. Claims 16,17,30,31,44,45,47, and 48 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) in view of Van Lieshout et al. (US Pub. No. 2001/0036823) and further in view of Krishnan et al. (US Pub. No. 2005/0176455).

Regarding claims 16,30,44, and 47, the combination of Zeira, Chen, and Van Lieshout fail to teach the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

However, in related art, Krishnan teaches the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only (Paragraphs 0047-0050, especially, Paragraphs 0049-0050). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Krishnan to Zeira, Chen, and Van Lieshout in order to provide the transmitting terminal feedback regarding the power of signals received at the receiving terminal.

Regarding claim 17,31,45, and 48, the combination of Zeira, Chen, and Van Lieshout fail to teach the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

However, in related art, Krishnan teaches the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control (Paragraphs 0047-0050, especially, Paragraphs 0049-0050).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Krishnan to Zeira, Chen, and Van

Lieshout in order to provide the transmitting terminal feedback regarding the power of signals received at the receiving terminal.

11. Examiner has cited particular columns and line numbers in the references applied to the claims above for the convenience of the applicant. Although the specified citations are representative of the teachings of the art and are applied to specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the Examiner. SEE MPEP 2141.02 [R-5] VI. PRIOR ART MUST BE CONSIDERED IN ITS ENTIRETY, INCLUDING DISCLOSURES THAT TEACH AWAY FROM THE CLAIMS: A prior art reference must be considered in its entirety, i.e., as a whole, including portions that would lead away from the claimed invention. W.L. Gore & Associates, Inc. v. Garlock, Inc., 721 F.2d 1540, 220 USPQ 303 (Fed. Cir. 1983), cert. denied, 469 U.S. 851 (1984) In re Fulton, 391 F.3d 1195, 1201,73 USPQ2d 1141, 1146 (Fed. Cir. 2004). >See also MPEP §2123.

Response to Arguments

12. Applicant's arguments with respect to claims 1-4,7,8,15-17,26,28,30-34, and 43-48 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

13. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Miyoshi et al. (US Pub. No. 2004/0171387), Kim et al. (US Pub. No. 2003/0032411, Para. 0008), Jiang et al. (US Pub. No. 2005/0041673, Para. 0005), Hwang et al. (US Pub. No. 2005/0207359, Para. 0038), Petrovic et al. (US Pub. No. 2007/0081492, Para. 0010 and 0117), Chao et al. (US Pub. No. 2009/0028111, Claims 1 and 5).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DOMINIC E. REGO whose telephone number is (571)272-8132. The examiner can normally be reached on Monday-Friday, 8:30 am-5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Duc M. Nguyen can be reached on 571-272-7503. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

<u>New Applications Under 35 U.S.C. 111</u>
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

<u>National Stage of an International Application under 35 U.S.C. 371</u>
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

<u>New International Application Filed with the USPTO as a Receiving Office</u>
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

AMENDMENT AND RESPONSE

Sir:

Applicants hereby petition under 37 CFR § 1.136(a) for a three-month extension of time in the above-identified application, up to and including September 30, 2009, to make this reply timely.

In response to the Office Action mailed March 31, 2009, please amend the above-identified patent application as follows:

Amendments to the Claims being reflected in the listing of claims beginning on page 2 of this paper; and

Remarks beginning on page 8 of this paper.

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended): A method of power control in a radio communication system, the method comprising, at a remote transceiver:

determining a path loss for a radio channel between a base station and the ~~a~~ remote transceiver; and

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

calculating at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

2. (Currently Amended): The method of power control of claim 1, the method further comprising transmitting an uplink signal ~~from the remote transceiver~~ at the calculated transmit power level.

3. (Original): The method of power control of claim 1, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

4. (Original): The method of power control of claim 3, wherein determining the path loss further

includes computing a difference between the signaled transmit power level and the measured received power level.

5-6. (Canceled)

7. (Original): The method of power control of claim 2, wherein the calculated transmit power level is based on a spreading factor parameter.

8. (Previously Presented): The method of power control of claim 2, wherein the calculated transmit power level is based on parameters associated with a selected transport format.

9.-14. (Canceled)

15. (Previously presented): The power control method of claim 1, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command.

16. (Previously presented): The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

17. (Previously presented): The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

18-25. (Cancelled)

26. (Currently Amended): A remote transceiver for a cellular communication system, the having ~~computer-readable medium encoded with~~ a computer program stored therein and further for supporting ~~controlling~~ power control in a radio communication system, the computer program comprising instructions for:

determining a path loss for a radio channel between a base station and the ~~a~~ remote transceiver; and

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command.

27. (Cancelled)

28. (Currently Amended): The remote transceiver ~~computer-readable medium~~ of claim 26, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and measuring a received power level of the downlink signal.

29. (Cancelled)

30. (Currently Amended): The remote transceiver ~~computer-readable medium~~ of claim 26 ~~29~~, the computer program further comprising instructions for receiving a signal from the base station for instructing the remote transmitter to utilize the accumulated TPC command only when calculating the transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

31. (Currently Amended): The remote transceiver ~~computer-readable medium~~ of claim 26 ~~29~~, the computer program further comprising instructions for receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when calculating the transmit power level, thereby disabling use of closed loop power control and enabling use of open loop power control only.

32. (Currently Amended): The remote transceiver ~~computer-readable medium~~ of claim 26 ~~29~~, the computer program further comprising instructions for transmitting an uplink signal from the remote transceiver at the calculated transmit power level.

33. (Currently Amended): The remote transceiver ~~computer-readable medium~~ of claim 26 ~~29~~, wherein calculating the transmit power level is additionally based on a spreading factor parameter.

34. (Currently Amended): The remote transceiver ~~computer-readable medium~~ of claim 26 ~~29~~, wherein calculating the transmit power level is additionally based on parameters associated with a selected transport format.

35.- 42. (Cancelled)

43. (Currently Amended): A method of power control in a radio communications system, the method comprising, at a base station:

on a shared physical channel used to carry allocation and scheduling information from the base station to a ~~the~~ remote transceiver, sending an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

44. (Previously presented): The power control method of claim 43, further comprising sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

45. (Previously presented): The power control method of claim 43, further comprising sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

46. (Currently Amended): A base station for a cellular communication system, the base station having ~~computer-readable medium encoded with~~ a computer program stored therein and further for controlling power in a radio communication system, the computer program comprising instructions for:

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

47. (Currently Amended): The base station ~~computer-readable medium~~ of claim 46, the computer program further comprising instructions for sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

48. (Currently Amended): The base station ~~computer-readable medium~~ of claim 46, the computer program further comprising instructions for sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

49. (New) A remote transceiver for supporting power control in a radio communication system, the remote transceiver comprising:

a signal processor for determining a path loss for a radio channel between a base station and the remote transceiver; and

a receiver arranged to receive, on a shared physical channel used to carry allocation and scheduling information from the base station, an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; wherein

the signal processor is arranged to calculate a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

50. (New) A base station for supporting power control in a radio communication system, the base station comprising:

a transmitter arranged to transmit, on a shared physical channel used to carry allocation and scheduling information, to a remote transceiver, an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

a receiver arranged to receive an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

REMARKS

Claims 1-4, 7, 8, 15-17, 26, 28, 30-34 and 43-48 were pending.

By virtue of this response, Claims 1-2, 26, 28, 30-34, 43 and 46-48 are amended.

New apparatus Claims 49 and 50 are being added.

By virtue of this response, Claims 1-4, 7, 8, 15-17, 26, 28, 30-34 and 43-50 are now pending

No new matter is being added.

Objections to the claims

Claims 30-34 were objected to as depending from a cancelled claim (claim 29). The applicant thanks the Examiner for noting this informality and for affording this opportunity to make a corresponding correction. Pursuant to this amendment these claims now depend from claim 26. The applicant therefore respectfully submits that these claims are in suitable condition to support examination and allowance.

Rejections under 35 U.S.C. 101

Claims 1-4, 7, 8, 15-17, 26-39, and 43-48 were rejected under 35 U.S.C. 101 as not presenting patent-eligible subject matter.

Claims 26-39 and 46-48

These claims were directed to a "computer-readable medium." The Examiner expressed concern that this expression is broad enough to encompass non-statutory content. Pursuant to this amendment, claims 26, 28, and 30-34 have been amended to now be directed to a "remote transceiver" while claims 27, 29, and 35-39 have been cancelled without prejudice. As a remote transceiver is clearly an apparatus, the applicant respectfully submits that the claimed subject matter is now clearly within the ambit of 35 U.S.C. 101. Claims 46-48, in turn, are amended to now refer to a "base station." As a base station is clearly an apparatus, again the applicant respectfully submits that the claimed subject matter is now clearly within the ambit of 35 U.S.C. 101.

Claims 1-4, 7, 8, 15-17, and 43-45

These claims were directed to "methods." The Examiner expressed concern that the recited steps could potentially be carried out in the absence of a corresponding apparatus and hence represent non-statutory content. Pursuant to this amendment we have made the tie between the recited steps and a particular apparatus clear. In independent claim 1, it is now clear that the steps are carried out by a "remote transceiver." In independent claim 43, it is now clear that the steps are carried out by a "base station." The remaining claims are ultimately dependent upon one of these independent claims. As these method claims are now all clearly tied to a particular apparatus, we respectfully submit that all of these claims are well within the patent-eligibility requirements of 35 U.S.C. 101.

Claim Rejection under 35 U.S.C § 103(a) of claims 1-4, 7, 8, 15-17, 26, 28, 30-34 and 43-48

On pages 4-7 of the Office Action, Claims 1-4, 7, 8, 15-17, 26, 28, 30-34 and 43-48 are rejected under 35 USC § 103(a) as being unpatentable over WO 00/57574 (hereinafter referred to as "Zeira") in view of US 2005/0025056 (hereinafter referred to as "Chen") and further in view of US 2001/0036823 (hereinafter referred to as "Van Lieshout"). Applicants are traversing this rejection.

The application presently contains six independent claims, namely method Claims 1 and 43, and apparatus Claims 26, 46, 49, and 50 (the latter two claims being newly introduced).. Each of independent Claims 1, 26, 43, 46, 49 and 50 recites, inter alia, "on a ***shared physical channel*** used to carry allocation and scheduling information from the base station to the remote transceiver, ***receiving [or sending] an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command***". Below, Applicants explain that Ziera in view of Chen and further in view of Van Lieshout does not teach all of the elements of these claims.

The Office Action suggests that Ziera discloses, with respect to Claim 1, the features of: determining a path loss for a radio channel between a base station and the remote transceiver (on page 2, lines 14-21; page 4, line 17-page 5, line 8); receiving a transmit power control (TPC) command (on page 4, line 17-page 5, line 8); and calculating at the remote transceiver, a transmit power level for the scheduled uplink transmission resource based upon the path loss and the TPC command (on page 4, line 18 to page 5, line 8).

The Office Action suggests that Ziera fails to disclose, with respect to Claim 1, the features of '***a shared physical channel*** used to carry allocation and scheduling information from the base station to the remote transceiver, and ***receiving an allocation of a scheduled uplink transmission resource***'.

The Office Action then suggests that Chen, in a 'related' art and in paragraphs [0012] and [0052-0057], discloses, with respect to Claim 1, the features of: 'used to carry allocation and scheduling information from the base station to the remote transceiver, and receiving an allocation of a scheduled uplink transmission resource'.

Based thereon, the Office Action states that it is 'obvious to one of ordinary skill in the art at the time of the invention to provide the teaching of Chen to Zeira in order to perform the efficient scheduling processing and to locate radio resources efficiently in the uplink high-speed packet communications method (Chen paragraph 12)'.

The Office Action then acknowledges that Ziera and Chen both fail to disclose, with respect to Claim 1, the feature of 'on ***a shared physical channel*** used to carry allocation and scheduling information and receiving an allocation of a scheduled uplink transmission resource …'.

The Office Action then suggests, however, that Van Lieshout, in a field that is neither characterized as being related to nor in a same field of endeavor, in paragraph [0006], discloses, with respect to Claim 1, the feature of: 'on ***a shared physical channel*** used to carry allocation and scheduling information and receiving an allocation of a scheduled ***uplink*** transmission resource …'.

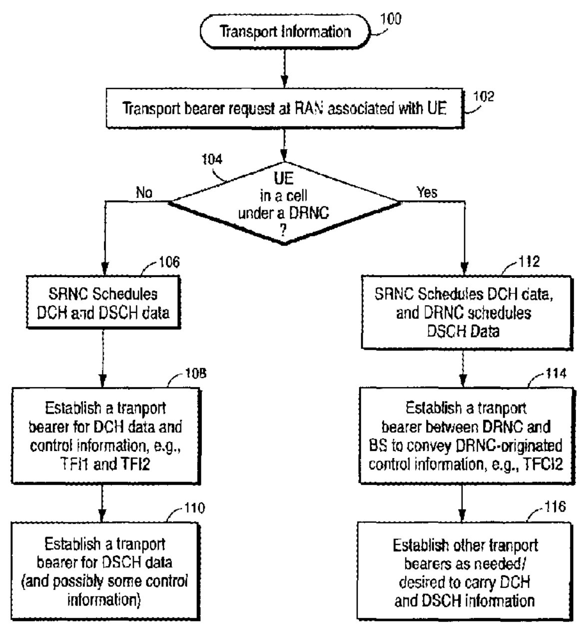
Based thereon, the Office Action states that it is 'obvious to one of ordinary skill in the art at the time of the invention to provide the teaching of Van Lieshout to Chen and Zeira so that the mobile unit can find out the available resources that it can use from the base station'.

In response, Applicants respectfully disagree.

It is respectfully submitted that the Office Action fails to establish prima facie obviousness for the following reasons. Below, Applicants explain that Zeira, in view of Chen and Van Lieshout, does not teach all of the elements of Claims 1, 26, 43 and 46.

With reference to the features of Claim 1 above, the teachings of Zeira in view of Chen and further in view of Van Lieshout fail to teach: 'on ***a shared physical channel*** used to carry allocation and scheduling information and receiving an allocation of a scheduled uplink transmission resource …', as recited in Claim 1.

It is clear to a skilled person in reading Van Lieshout that what is actually disclosed by Van Lieshout is a network that ***does not use a shared control channel*** on the downlink to allocate ***uplink*** resources. In contrast, the teaching of Van Lieshout is to use a transport format combination indicator (TFCI) transmission on a ***dedicated*** downlink channel to convey downlink shared channel resources (DSCH) to a mobile unit. We respectfully observe that this is the antithesis of the claimed invention. This clear teaching of Van Lieshout is illustrated in Fig. 5 (shown at the right) where the downlink shared channel resources "DSCH" indication clarifies that Van Lieshout discloses allocation of downlink resources (and notably not ***uplink*** (UL) resources). A further clarification of the teaching of Van Lieshout in allocating downlink resources is found in paragraph [0023] and again in the last five lines of paragraph [0026], where it specifies that the allocation of DL resources is made via a dedicated DL channel, see paragraphs [0031], [0033] and [0036].



Thus, Applicants respectfully disagree that Van Lieshout discloses the feature in Claim 1 of 'on ***a shared physical channel*** used to carry allocation and scheduling information and receiving an allocation of a scheduled ***uplink*** transmission resource …', (***Emphasis added***).

Claim 26 is a remote transceiver that implements a computer program corresponding to the method of Claim 1. Consequently, the arguments set forth above in support of Claim 1 apply equally to Claim 26. In accordance with the aforementioned explanations, it is therefore respectfully submitted that the teachings of Zeira in view of Chen and further in view of Van Lieshout fail to teach: 'on ***a shared physical channel*** used to carry allocation and scheduling information and receiving an allocation of a scheduled ***uplink*** transmission resource …**,** as recited in claim 26.

Claim 43 is a method claim for a base station that corresponds to the remote transceiver method of Claim 1. Consequently, the arguments set forth above in support of Claim 1 apply equally to Claim 43. In accordance with the aforementioned explanations, it is therefore respectfully submitted that the teachings of Zeira in view of Chen and further in view of Van Lieshout fail to teach: 'on a ***shared physical channel*** used to carry allocation and scheduling information from the base station to a remote transceiver, ***sending*** an allocation of a scheduled ***uplink*** transmission resource ***and transmit power control (TPC) command'*** as recited in claim 3.

Claim 46 is a base station having a computer program that corresponds to the method of Claim 1. Consequently, the arguments set forth above in support of Claim 1 apply equally to Claim 46. In accordance with the aforementioned explanations, it is therefore respectfully submitted that the teachings of Zeira in view of Chen and further in view of Van Lieshout fail to teach: 'on ***a shared physical channel*** used to carry allocation and scheduling information and receiving an allocation of a scheduled ***uplink*** transmission resource and a transmit power control (TPC) command**,** as recited in claim 46.

New Claim 49 is a remote transceiver that implements the method of Claim 1. Consequently, the arguments set forth above in support of Claim 1 apply equally to Claim 49. In accordance with the aforementioned explanations, it is therefore respectfully submitted that the teachings of Zeira in view of Chen and further in view of Van Lieshout fail to teach: 'on ***a shared physical channel*** used to carry allocation and scheduling information and receiving an allocation of a scheduled ***uplink*** transmission resource …**,** as recited in claim 49.

New Claim 50 is a base station claim that implements the method of Claim 43. Consequently, the arguments set forth above in support of Claim 43 apply equally to Claim 50. In accordance with the aforementioned explanations, it is therefore respectfully submitted that the teachings of Zeira in view of Chen and further in view of Van Lieshout fail to teach: 'on a ***shared physical channel*** used to carry allocation and scheduling information from the base station to a remote transceiver, ***sending*** an allocation of a scheduled ***uplink*** transmission resource ***and transmit power control (TPC) command'*** as recited in claim 50.

Although the points raised above are sufficient to distinguish the claims from the cited prior art references, for the record we note that the Office Action also suggests that Zeira and Chen comprise a "related art." Applicant respectfully disagrees with this suggestion.

Zeira (see throughout the description, for example the abstract and background) clearly indicates that it's relevant field is 'combined closed loop/open loop power control in a spread spectrum communication system' and more particularly measuring power levels from transmissions and determining path loss estimates. Chen, on the other hand, clearly relates to the wholly different field of packet data communications between a base station and a mobile station (see throughout the description, for example the abstract and field of the invention).

It is noteworthy that there is no disclosure within Zeira of any aspect of packet data communications. Thus, there is no reason for a skilled person working in the field of power control to consider the field of packet data communications, as disclosed by Chen. Furthermore, there is no reason for a skilled person working in the packet data communications field of Chen to consider the field of power control, as disclosed by Zeira.

It is further noted that the field of Van Lieshout is a use of indicators in a drift radio network controller to allocate downlink resources (see background). It is further noted that the Office Action has advanced no comment as to why Van Lieshout is from the same field of endeavor as that of Zeira and Chen. Thus, Applicant respectfully disagrees with any suggestion that a skilled artisan would consider their respective teachings.

In addition, it is respectfully submitted that any theoretical combination of the teachings of Zeira with Chen will require considerable modification to the architecture of both Zeira as well as Chen, not least because the communication units and associated methods of either document have no bearing on the field of the other document.

Furthermore, it is respectfully submitted that any theoretical combination of the teachings of Zeira with Van Lieshout will again require considerable modification to the architecture of both Zeira as well as Van Lieshout, not least because the communication units and associated methods of either document have no bearing on the field of the other document.

Furthermore, it is respectfully submitted that any theoretical combination of the teachings of Chen with Van Lieshout will also require considerable modification to the architecture of both Chen as well as Van Lieshout, not least because the communication units and associated methods of either document have no bearing on the field of the other document.

Indeed, the Office Action does not explain how such a combination of wholly different teachings can be achieved.

Additionally, Applicants note that under a rejection under 35 U.S.C.5 103, the prior art references must not render the prior art unsatisfactory for its intended purpose of the claimed invention (MPEP § 2143.01).

Accordingly, one of skill in the art would not apply any theoretical teaching of shared downlink physical channels (noting the shared physical channel teaching of Van Lieshout allocates ***downlink*** resource) to both Zeira and Chen, as making such a combination would render both Zeira and Chen respectively unsatisfactory for their intended purpose, as both explicitly require the use of a dedicated control channel for their respective, wholly different purposes.

In addition, it is particularly noted that Chen has as an objective (see paragraphs [0010] and [0011]), a reduction in the number of notification bits to report in data packets to reduce a burden on a transmission buffer. In direct contrast to the aim of Chen, the Office Action has suggested that a skilled person may wish to combine the teaching of Zeira into Chen and, thus, send further information in the packet data communication architecture, namely power control commands. Applicants note, therefore, that the rejection under 35 U.S.C.5 103, where the prior art references must not render the prior art unsatisfactory for its intended purpose of the claimed invention (MPEP 2143.01) is improperly formulated. See MPEP 2143.01, Subsection entitled THE PROPOSED MODIFICATION CANNOT RENDER THE PRIOR ART UNSATISFACTORY FOR ITS INTENDED PURPOSE citing *In re Gordon*, 733 F.2d 900 (Fed Cir. 1984).

It is further respectfully submitted that the reasons stated in the Office Action for combining the references is insufficient for establishing prima facie obviousness. In this respect, the reason provided in the Office Action for combining the teachings of Zeira and Chen is simply:

> "…obvious … to provide the above teaching of Chen to Zeira in order to perform the ***efficient scheduling processing*** and to allocate ***radio resources efficiently in the uplink high speed packet communications method***" [Emphasis added]

The claimed invention provides a mechanism for performing a combined open loop and closed loop power control scheme and in particular for combining on the same physical channel an allocation of scheduled uplink transmission resources with feedback information on the combined power control scheme (see paragraph [0084]).

Zeira has, as an objective (see page 4, lines 13-14), the maintenance of signal quality and low transmission levels. Thus, the Office Action does not advance any evidence that Chen will satisfy this requirement.

Chen, has, as an objective (see paragraphs [0010] and [0011]), a reduction in the number of notification bits to report in data packets to reduce a burden on a transmission buffer. In direct contrast to the aim of Chen, the Office Action has suggested that a skilled person may wish to combine the teaching of Zeira into Chen and, thus, send further information in the packet data communication architecture, namely power control commands.

Furthermore, these reasons appear to be taken from Chen, which already offers a solution to the aforementioned allocation of ***radio resources efficiently in the uplink***. Consequently, it is respectfully submitted that if Chen meets the above need to allocate ***radio resources efficiently in the uplink***, the skilled person would have no reason to refer to either Zeira (or Van Lieshout, where no properly formulated reason has yet been provided), and indeed would be particularly motivated not to refer to Zeira for the reasons mentioned above.

Hence, it is submitted that a sufficient reason has not been provided to make the suggested combination. Referring to MPEP 2143.01, Subsection IV entitled "Mere Statement That The Claimed Invention Is Within the Capabilities of One of Ordinary Skill in the Art is Not Sufficient By Itself To Establish Prima Facie Obviousness." seems pertinent. This subsection states: "Rejections on obviousness cannot be sustained by mere conclusory statements; instead, there must be some articulated reasoning with some rational underpinning to support the legal conclusion of obviousness.'" *KSR Int'l v. Teleflex, Inc*., 550 U.S. 127, 82 USPQ2d at 1396 (2007). See also *Ex parte Penhasi*, BPAI Appeal No. 2007-2534 (December 13, 2007) ("The Examiner has not articulated a sufficient reason why one skilled in the art would have modified [the art] and arrived at the presently claimed subject matter."). It is therefore submitted that the Office Action has not satisfied the necessary criteria of providing a reasoning to combine Zeira with Chen and further with Van Lieshout and so the rejection raised is improperly formulated.

Furthermore, it is respectfully submitted that Zeira does not suggest any modification thereof with the teachings of Chen. Similarly, Chen does not suggest modification thereof with the teachings of Zeira. Similarly, Zeira does not suggest modification thereof with the teachings of Van Lieshout. Similarly, Chen does not suggest modification thereof with the teachings of Van Lieshout. Indeed, it is submitted that the skilled person, reading Zeira or Chen or Van Lieshout, is not provided with a reasonable expectation of success when making the combination suggested in the Office Action due to the lack of any such indication of suitability or desirability to make a modification.

Hence, there is no teaching in the cited prior art suggesting the modification and it is the present application alone that teaches the modified apparatus. The applicant's respectfully submit that one can only achieve something close to the claimed result by employing the applicant's own teachings, using impermissible hindsight, to effect a highly-selective picking and choosing amongst the teachings of these various references.

Claims 2-4, 7, 15, 26, 28, 32, 33 were rejected under 35 U.S.C. 103(a) as allegedly being unpatentable over Zeira in view of Chen and further in view of Van Lieshout.

For at least the reason that Claims 2-4, 7, 15, 26, 28, 32, 33 each depend from an allowable independent Claim, Claims 2-4, 7, 15, 26, 28, 32, 33 are also allowable. Applicants respectfully request reconsideration and allowance of Claims 2-4, 7, 15, 26, 28, 32, 33.

Claims 8 and 34 are rejected under 35 U.S.C. 103(a) as allegedly being unpatentable over Zeira in view of Chen and further in view of Van Lieshout, and further in view of Shiu et al. US 6,983,166.

For at least the reasons Claims 8 and 34 each depend from an allowable independent claim, Claims 8 and 34 are also allowable. Applicants respectfully request reconsideration and allowance of Claims 8 and 34.

Claims 16, 30, 44 and 47 are rejected under 35 U.S.C. 103(a) as allegedly being unpatentable over Zeira in view of Chen and further in view of Van Lieshout, and further in view of Krishnan (US Pub. No. 2005/0176455).

For at least the reasons Claims 16, 30, 44 and 47 each depend from an allowable independent claim, Claims 16, 30, 44 and 47 are also allowable. Applicants respectfully request reconsideration and allowance of Claims 16, 30, 44 and 47.

While the applicant believes that other arguments are available to highlight the allowable subject matter presented in various ones of these dependent claims, the applicant also believes that the comments set forth herein regarding allowability of the independent claims are sufficiently compelling to warrant present exclusion of such additional points for the sake of brevity and expedited consideration.

In summary, none of the references discloses or suggests "on a ***shared physical channel*** used to carry allocation and scheduling information from the base station to the remote transceiver, ***receiving (or sending) an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command***", as required by the claims. For at least this reason, the alleged prior art references, alone or combined, do not teach or suggest all the claim limitations for Claims 1-4, 7, 8, 15-17, 26, 28, 30-34 and 43-50.

Accordingly, Applicant respectfully requests reconsideration and allowance of Claims 1-4, 7, 8, 15-17, 26, 28, 30-34 and 43-50.

The case is believed to be in condition for allowance and notice to such effect is respectfully requested. If there is any issue that may be resolved, the Examiner is respectfully requested to telephone the undersigned.

Respectfully submitted,

Fitch, Even, Tabin & Flannery

Date: September 30, 2009

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *30 September 2009*.

2a)☒ This action is **FINAL**. 2b)☐ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) *1-4,7,8,15-17,26,28,30-34 and 43-50* is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) *1-4,7,8,15-17,26,28,30-34 and 43-50* is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☐ The specification is objected to by the Examiner.

10)☐ The drawing(s) filed on _____ is/are: a)☐ accepted or b)☐ objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12)☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a)☐ All b)☐ Some * c)☐ None of:

1.☐ Certified copies of the priority documents have been received.

2.☐ Certified copies of the priority documents have been received in Application No. _____.

3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. This communication is responsive to the application filed on September 30, 2009.

Claims 1-4,7-8,15-17,26,28,30-34, and 43-50 are pending and presented for prosecution.

Claims 1-2,26,28,30-32,34,43,46-48 have been amended and new claims 49-50 have been added.

Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

> Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

3. Claims 26,28,30-34 and 46-48 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 26,28,30-34 and 46-48 recite “A remote transceiver or A base station for a cellular communication system, the remote transceiver or the base station having a computer program stored therein”. In the specification, paragraph 0026, recites “A procedure, computer executed step, logic block, process etc., are here conceived to be a self-consistent sequence of steps or instructions leading to a desired result. The steps are those utilizing physical manipulations of physical quantities. <u>These quantities can take the form of electrical, magnetic, or radio signals capable of being stored,</u>

transferred, combined, compared, and otherwise manipulated in a computer system. These signals may be referred to at times as bits, values, elements, symbols, characters, terms, numbers, or the like". So treating claim 26-39 and 46-48 as a whole, it is effectively claiming a signal. Signal does not within any of the statutory categories, thus, not statutory (See MPEP 2100, In re Nuitjen, Docket no. 2006-1371 (Fed. Cir. Sept 20, 2007)(slip. Op. at 18)). Applicant is advised to delete the above underlying part from the specification because of "claiming signals".

Claim Rejections - 35 USC § 112

4. The following is a quotation of the first paragraph of 35 U.S.C. 112:

> The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

5. Claims 26,28,30-34 and 46-48 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Regarding claims 26 and 46, Applicant recites the limitations "A remote transceiver or A base station for a cellular communication system, the remote transceiver or the base station having a computer program stored therein" is not disclose in the Specification.

Claim Objections

6. Claim 26 is objected to because of the following informalities: Applicant recited limitations “A remote transceiver for a cellular communication system, the having a computer program stored therein”. The underlying part should be -- the remote transceiver having a computer program stored therein --. Appropriate correction is required.

Claim Rejections - 35 USC § 103

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

8. Claims 1-4,7,15,26,28,32,33,43,46,49 and 50 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) and further in view of Van Lieshout et al. (US Pub. No. 2001/0036823).

Regarding claim 1, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising, at a remote transceiver:

determining a path loss of a radio channel between a base station and the remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);

receiving a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

calculating, at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is* *configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teachon a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claims 2 and 32, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claims 1 and 26. In addition, Zeira teaches the method of power control, the method further comprising transmitting an uplink signal at a calculated transmit power level (Page 5, lines 4-8).

Regarding claims 3 and 28, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claims 1 and 26. In addition, Zeira teaches the method of power control, wherein determining the path loss includes: receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and measuring a received power level of the downlink signal (Page 2, lines 14-21; Page 4, lines 17-page 8).

Regarding claim 4, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the method of power control, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level (Page 2, lines 1-lines 21; Page 5, lines 2-lines 4).

Regarding claims 7 and 33, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the method of power control, wherein the calculated the transmit power level is based on a spreading factor parameter (Page 13, lines 2-15).

Regarding claim 15, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the power control method, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command (Page 4, line 17-Page 5, line 8).

Regarding claim 26, Zeira teaches a remote transceiver for a cellular communication system, the remote transceiver having a computer program for controlling power in a radio communication system, the computer program comprising instructions for:

determining a path loss for a radio channel between a base station and the remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);
and

receiving a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teachon a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout* *teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 43, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising, at a base station:

sending transmit power control (TPC) commands (Page 4, line 17-Page 5, line 8); and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except on a shared physical channel used to carry allocation and scheduling information from the base station to a remote transceiver, sending an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teachon a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 46, Zeira teaches a base station for a cellular communication system, the base station having a computer program stored therein and further for controlling power in a radio communication system (See Abstract), the computer program comprising instructions for:

sending a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the* *power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level)*, but fails to teach on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teachon a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 49, Zeira teaches a remote transceiver for supporting power control in a radio communication system, the remote transceiver comprising:

a signal processor for determining a path loss for a radio channel between a base station and the remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8); and

a receiver arranged to receive transmit power control (TPC) command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The* *first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level*;

wherein the signal processor is arranged to calculate a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except on a shared physical channel used to carry allocation and scheduling information from the base station and an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station and an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the* *present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teachon a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow* *the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 50, Zeira teaches a base station for supporting power control in a radio communication system, the base station comprising:

a transmitter arranged to transmit to a remote transceiver and transmit power control (TPC) command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level)*; and

a receiver arranged to receive an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8), except for on a shared physical channel used to carry allocation and scheduling information and an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information and an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a <u>downlink dedicated control channel (DCCH)</u>. Paragraph 0052, Chen teaches the resource allocating unit 14 is <u>configured to allocate a radio resource which is used in uplink packet communications</u> with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teachon a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the* *mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

9. Claims 8 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) in view of Van Lieshout et al. (US Pub. No. 2001/0036823) and further in view of Shiu et al. (US Patent #6,983,166).

Regarding claims 8 and 34, the combination of Zeira, Chen, and Van Lieshout fails to teach the method of power control, wherein the calculated transmit power level is based on parameter associated with a selected transport format.

However, in related art, Shiu teaches the method of power control, wherein the calculated transmit power level is based on parameter associated with a selected transport format. (Col 3, lines 27-41).Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Shiu to Zeira, Chen, and Van Lieshout in order to adjust transmit power and achieve target block error rate (BLERs) (See Shiu, Col 3, line 31).

10. Claims 16,17,30,31,44,45,47, and 48 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) in view of Van Lieshout et al. (US Pub. No. 2001/0036823) and further in view of Krishnan et al. (US Pub. No. 2005/0176455).

Regarding claims 16,30,44, and 47, the combination of Zeira, Chen, and Van Lieshout fail to teach the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

However, in related art, Krishnan teaches the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only (Paragraphs 0047-0050, especially, Paragraphs 0049-0050). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Krishnan to Zeira, Chen, and Van Lieshout in order to provide the transmitting terminal feedback regarding the power of signals received at the receiving terminal.

Regarding claim 17,31,45, and 48, the combination of Zeira, Chen, and Van

Lieshout fail to teach the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

However, in related art, Krishnan teaches the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control (Paragraphs 0047-0050, especially, Paragraphs 0049-0050).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Krishnan to Zeira, Chen, and Van Lieshout in order to provide the transmitting terminal feedback regarding the power of signals received at the receiving terminal.

11. Examiner has cited particular columns and line numbers in the references applied to the claims above for the convenience of the applicant. Although the specified citations are representative of the teachings of the art and are applied to specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the Examiner. SEE MPEP 2141.02 [R-5] VI. PRIOR ART MUST BE CONSIDERED

IN ITS ENTIRETY, INCLUDING DISCLOSURES THAT TEACH AWAY FROM THE CLAIMS: A prior art reference must be considered in its entirety, i.e., as a whole, including portions that would lead away from the claimed invention. W.L. Gore & Associates, Inc. v. Garlock, Inc., 721 F.2d 1540, 220 USPQ 303 (Fed. Cir. 1983), cert. denied, 469 U.S. 851 (1984) In re Fulton, 391 F.3d 1195, 1201,73 USPQ2d 1141, 1146 (Fed. Cir. 2004). >See also MPEP §2123.

Response to Arguments

12. Applicant's arguments with respect to claims 1-4,7,8,15-17,26,28,30-34, and 43-48 have been considered but are moot in view of the new ground(s) of rejection. Regarding claims 1,26,43, 46,49, and 50, Applicant argues that Zeira in view of Chen and further in view of Van Lieshout fail to teach "on a shared physical channel used to carry allocation and scheduling information and receiving an allocation of a scheduled uplink transmission resource. The Examiner respectfully disagrees. P*aragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a* <u>*downlink dedicated control channel (DCCH)*</u>*. Paragraph 0052, Chen teaches the resource allocating unit 14 is* <u>*configured to allocate a radio resource which is used in uplink packet communications*</u> *with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30. Above cited paragraphs covers the*

limitations "downlink dedicated control channel (DCCH) used to carry allocation and scheduling information and receiving an allocation of a scheduled uplink transmission resource". On the other hand, Van Lieshout, Paragraph 0006, teaches *since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel which covers the limitations* "on a shared physical channel (shared radio channel) used to carry allocation and scheduling information".

For the reasons as set forth above, the examiner contends that the rejection to 1-4,7-8,15-17,26,28,30-34, and 43-50 is proper.

Conclusion

13. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DOMINIC E. REGO whose telephone number is (571)272-8132. The examiner can normally be reached on Monday-Friday, 9:00 am-5:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner’s supervisor, Duc M. Nguyen can be reached on 571-272-7503. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these record s.

2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.

3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.

4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).

5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.

6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).

7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.

8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.

9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

<u>New Applications Under 35 U.S.C. 111</u>
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

<u>National Stage of an International Application under 35 U.S.C. 371</u>
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

<u>New International Application Filed with the USPTO as a Receiving Office</u>
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

SUPPLEMENTAL INFORMATION DISCLOSURE STATEMENT TRANSMITTAL

Sir:

Pursuant to the duty of disclosure under 37 C.F.R. § 1.56, and in accordance with MPEP § 601 and 37 C.F.R. §§ 1.97 and 1.98, Applicants and the undersigned attorney bring the information listed on Form PTO/SB/08a, filed concurrently herewith, to the attention of the Examiner.

The references cited in this Information Disclosure Statement were cited in the Communication Pursuant to Article 94(3) EPC (European Application No. 05 801 370.7-1246) which issued on December 30, 2009, a copy of which is attached.

Pursuant to 37 C.F.R. § 1.97(h), the filing of this Information Disclosure Statement shall not be construed to be an admission that the information cited in the statement is, or is considered to be, material to patentability as defined in 37 C.F.R. § 1.56(b).

The Commissioner is hereby authorized to charge any additional fees which may be required with respect to this communication, or credit any overpayment, to Deposit Account No. 06-1135.

Respectfully submitted,

FITCH, EVEN, TABIN & FLANNERY

STATEMENT UNDER 37 CFR 3.73(b)

Applicant/Patent Owner: Nicholas W. Anderson

Application No./Patent No.: 10/917,968 Filed/Issue Date: August 12, 2004

Entitled: Power Control in a Wireless Communication System

IPWireless, Inc., a Corporation
(Name of Assignee) (Type of Assignee, e.g., corporation, partnership, university, government agency, etc.)

states that it is:

1. ☑ the assignee of the entire right, title, and interest; or

2. ☐ an assignee of less than the entire right, title and interest
(The extent (by percentage) of its ownership interest is_________ %)

in the patent application/patent identified above by virtue of either:

A. ☑ An assignment from the inventor(s) of the patent application/patent identified above. The assignment was recorded in the United States Patent and Trademark Office at Reel 024006, Frame 0144, or for which a copy thereof is attached.

OR

B. ☐ A chain of title from the inventor(s), of the patent application/patent identified above, to the current assignee as follows:

1. From: ____________ To: ____________
The document was recorded in the United States Patent and Trademark Office at
Reel ________, Frame ________, or for which a copy thereof is attached.

2. From: ____________ To: ____________
The document was recorded in the United States Patent and Trademark Office at
Reel ________, Frame ________, or for which a copy thereof is attached.

3. From: ____________ To: ____________
The document was recorded in the United States Patent and Trademark Office at
Reel ________, Frame ________, or for which a copy thereof is attached.

☐ Additional documents in the chain of title are listed on a supplemental sheet.

☐ As required by 37 CFR 3.73(b)(1)(i), the documentary evidence of the chain of title from the original owner to the assignee was, or concurrently is being, submitted for recordation pursuant to 37 CFR 3.11.

[NOTE: A separate copy (*i.e.,* a true copy of the original assignment document(s)) must be submitted to Assignment Division in accordance with 37 CFR Part 3, to record the assignment in the records of the USPTO. See MPEP 302.08]

The undersigned (whose title is supplied below) is authorized to act on behalf of the assignee.

Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

ASSERTION OF SMALL ENTITY STATUS

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Dear Sir:

In accordance with 37 C.F.R. §1.28(b), written notification is hereby provided to the U.S. Patent and Trademark Office of the assertion of small entity status in the above-identified patent. The Assignee of the present patent is a small entity under 37 C.F.R. §1.27(a)(3) and hereby requests that the patent show said small entity status.

Respectfully requested,

FITCH, EVEN, TABIN & FLANNERY

Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

NOTICE OF APPEAL FROM THE PRIMARY EXAMINER TO THE BOARD OF PATENT APPEALS AND INTERFERENCES

Sir:

Applicants hereby appeal to the Board of Patent Appeals and Interferences from the decision of the Examiner dated January 8, 2010 finally rejecting claims 1-4, 7, 15, 26, 28, 32, 33, 43, 46, 49, and 50.

☒ The fee for this Notice of Appeal is $ 540.00 (37 CFR § 41.20(b)(1)).

☒ Applicants submit herewith a Pre-Appeal Brief Request For Review and Brief In Support of Pre-Appeal Brief Request For Review.

☒ Authorization to charge Deposit Account No. 06-1135 for the Appeal Fee was given using EFS-Web.

☒ The Commissioner is hereby authorized to charge any additional fees which may be required in connection with this appeal (specifically including the fee for filing a brief in support of this appeal if such brief is filed unaccompanied by full payment therefor, and the fee for filing a request for an oral hearing if such request is made unaccompanied by full payment therefor), or credit any overpayment to Deposit Account No. 06-1135.

BRIEF IN SUPPORT OF PRE-APPEAL BRIEF REQUEST FOR REVIEW

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Dear Sir:

In response to the Office Action dated January 8, 2010, as entered in the above-captioned matter, please enter the following brief in support of the attached Pre-Appeal brief Request for Review. A Notice of Appeal is also submitted herewith.

Certain claims were objected to or rejected under 35 U.S.C. 112 and 35 U.S.C. 101. Claims 1-4, 7, 15, 26, 28, 32, 33, 43, 46, 49, and 50 were rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) ("Zeira") in view of Chen et al. (US Pub. No. 2005/0025056) ("Chen") and further in view of Van Lieshout et al. (US Pub. No. 2001/0036823) ("Lieshout"). We respectfully observe that at least some of these rejections are based upon clear error.

I. Clear Error: The Van Lieshout reference does not teach allocating a scheduled uplink transmission resource and TCP command on a shared physical

channel that is also used to carry allocation and scheduling information from a base station to a remote transceiver

Our claim 1 specifies that a remote transceiver receives "an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command" on "a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver." The Examiner agrees that neither Zeira nor Chen disclose such a thing. The Examiner then seeks to rely upon the Van Lieshout reference in these regards.

The Examiner's specific interpretation of Van Lieshout reads as follows:

> However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).*

Van Lieshout's paragraph 0006 as relied upon by the Examiner reads as follows:

> **[0006]** In one example implementation of the present invention, a computer-generated data signal, (e.g., generated in a computer in the DRNC), is transported on a separate transport bearer between the DRNC and the base station having a particular format. A frame number field includes a specific frame number identifying a frame on the shared

> radio channel. A transport format indicator field includes information relating to a particular radio channel resource in the corresponding frame. In one example implementation, the transport format indicator field includes an index to a transport format table previously stored in the mobile radio unit. In other words, the index addresses particular entries in the look-up table so the mobile can retrieve certain information that will allow it to receive and decode information intended for that mobile radio unit on the shared radio channel. For example, since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel.

Van Lieshout does refer to a "shared radio channel" in this paragraph. This shared radio channel, however, does not convey allocation and scheduling information. Instead, and elsewhere in his specification, Van Lieshout discloses use of a dedicated (and *non-shared*) downlink channel to convey downlink information of this sort. Van Lieshout further discloses that this dedicated non-shared downlink channel is used to convey such information as relates to downlink (and not uplink) shared resources.

Our claim 1, however specifies, "on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command." In making his rejection, the Examiner misses the point that Van Lieshout discloses sending his allocation and scheduling information to a transceiver on a downlink *dedicated* (and not shared) channel, with his follow-on data (which is distinctly not the allocation and scheduling information) being then sent on a *downlink* shared channel. As a result, Van Lieshout plainly and wholly fails to teach sending uplink allocation and scheduling information on a shared channel as specified by our claims.

II. Conclusion

We respectfully submit that the proffered claims are allowable over the references of record. In any event, we submit that our independent claims, such as claim 1 discussed in detail above, clearly contain content that is different from the teachings of Van Lieshout.

Respectfully submitted,

FITCH, EVEN, TABIN & FLANNERY

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

2618	

MAIL DATE	DELIVERY MODE
08/03/2010	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

# Notice of Panel Decision from Pre-Appeal Brief Review	**Application/Control No.** 10/917,968	**Applicant(s)/Patent under Reexamination** ANDERSON, NICHOLAS WILLIAM	
	DOMINIC REGO	**Art Unit** 2618	

This is in response to the Pre-Appeal Brief Request for Review filed 8 June 2010.

1. ☐ **Improper Request** – The Request is improper and a conference will not be held for the following reason(s):

   ☐ The Notice of Appeal has not been filed concurrent with the Pre-Appeal Brief Request.
   ☐ The request does not include reasons why a review is appropriate.
   ☐ A proposed amendment is included with the Pre-Appeal Brief request.
   ☐ Other: .

   The time period for filing a response continues to run from the receipt date of the Notice of Appeal or from the mail date of the last Office communication, if no Notice of Appeal has been received.

2. ☒ **Proceed to Board of Patent Appeals and Interferences** – A Pre-Appeal Brief conference has been held. The application remains under appeal because there is at least one actual issue for appeal. Applicant is required to submit an appeal brief in accordance with 37 CFR 41.37. The time period for filing an appeal brief will be reset to be one month from mailing this decision, or the balance of the two-month time period running from the receipt of the notice of appeal, whichever is greater. Further, the time period for filing of the appeal brief is extendible under 37 CFR 1.136 based upon the mail date of this decision or the receipt date of the notice of appeal, as applicable.

   ☒ The panel has determined the status of the claim(s) is as follows:
   Claim(s) allowed: _____.
   Claim(s) objected to: _____.
   Claim(s) rejected: *1-4, 7-8, 15-17, 26, 28, 30-34, 43-50*.
   Claim(s) withdrawn from consideration: _____.

3. ☐ **Allowable application** – A conference has been held. The rejection is withdrawn and a Notice of Allowance will be mailed. Prosecution on the merits remains closed. No further action is required by applicant at this time.

4. ☐ **Reopen Prosecution** – A conference has been held. The rejection is withdrawn and a new Office action will be mailed. No further action is required by applicant at this time.

All participants:

(1) *DUC NGUYEN*.

(2) *DOMINIC REGO*.

(3) *EDWARD URBAN*.

APPEAL BRIEF

Sir:

Pursuant to 37 C.F.R. § 41.37, the Applicants hereby respectfully submit the following Brief in support of their appeal.

TABLE OF CONTENTS

(1) Real Party in Interest

The real party in interest is Wireless Technology Solutions LLC, a corporation having a primary place of business in New York, New York.

(2) Related Appeals and Interferences

There are no related appeals or interferences known to appellant, the appellant's legal representative, or assignee that will directly affect, or be directly affected by or have a bearing on the Board's decision in the pending appeal.

(3) Status of Claims

Claims 1-4, 7, 8, 15-17, 26, 28, 30-34, and 43-50 are pending and presently stand at least twice and finally rejected and constitute the subject matter of this appeal.

(4) Status of Amendments

No post-final amendments have been submitted.

(5) Summary of Claimed Subject Matter

A concise explanation of this subject matter appears as follows in the form of claim subject matter maps with corresponding references to the specification by paragraph numbering and to the drawings by figure number and reference characters where applicable.[1]

Independent Claim 1

Reference Characters	Specification Paragraph Numbers Figure Numbers
A method of power control in a radio communication system, the method comprising, at a remote transceiver (140):	FIGS. 1-4 Paragraph 0025
determining (230, 432) a path loss for a radio channel between a base station (120) and the remote transceiver; and	FIGS. 2, 4 Paragraph 0025, 0063-0066
on a shared physical channel (416) used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource (402) and transmit power control (TPC) command (418);	FIG. 4 Paragraphs 0033, 0065
and calculating (436) at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.	FIG. 4 Paragraphs 0066-0072

[1] It will be understood that this summarization of the claimed subject matter is, in fact, a "summary" and that the Applicants do not represent or intend that this brief presentation, or the accompanying references to the drawings and the specification, comprise an exhaustive presentation in this regard. As always, the claims are to be viewed and interpreted in view of the context of the entire specification sans the Abstract.

Independent Claim 26

Reference Characters	Specification Paragraph Numbers Figure Numbers
A remote transceiver (140) for a cellular communication system, the having a computer program stored therein and further for supporting power control in a radio communication system, the computer program comprising instructions for:	FIGS. 1-4 Paragraph 0024, 0025
determining (230, 432) a path loss for a radio channel between a base station (120) and the remote transceiver;	FIGS. 2, 4 Paragraphs 0063-0066
on a shared physical channel (416) used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource (402) and a transmit power control (TPC) command (418); and	FIG. 4 Paragraphs 0033, 0065
calculating (436) a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command.	FIG. 4 Paragraphs 0066-0072

Independent Claim 43

Reference Characters	Specification Paragraph Numbers Figure Numbers
A method of power control in a radio communications system, the method comprising, at a base station (120):	FIGS. 1-4 Paragraph 0025

Reference Characters	Specification Paragraph Numbers Figure Numbers
on a shared physical channel (416) used to carry allocation and scheduling information from the base station to a remote transceiver (140), sending an allocation of a scheduled uplink transmission resource (402) and transmit power control (TPC) command (418);	FIG. 4 Paragraphs 0025, 0033, 0065
and receiving an uplink signal from the remote transceiver at a calculated (436) transmit power level based on a path loss (230, 432) and the TPC command.	FIGS. 2, 4 Paragraphs 0066-0072

Independent Claim 46

Reference Characters	Specification Paragraph Numbers Figure Numbers
A base station (120) for a cellular communication system, the base station having a computer program stored therein and further for controlling power in a radio communication system, the computer program comprising instructions for:	FIGS. 1-4 Paragraphs 0024, 0025
on a shared physical channel (416) used to carry allocation and scheduling information from the base station to the remote transceiver (140), sending an allocation of a scheduled uplink transmission resource (402) and a transmit power control (TPC) command (418);	FIG. 4 Paragraphs 0025, 0033, 0065

Reference Characters	Specification Paragraph Numbers Figure Numbers
and receiving an uplink signal from the remote transceiver at a calculated (436) transmit power level based on a path loss (230, 432) and the TPC command.	FIGS. 2, 4 Paragraphs 0066-0072

Independent Claim 49

Reference Character	Specification Paragraph Numbers Figure Number/
A remote transceiver (140) for supporting power control in a radio communication system, the remote transceiver comprising:	FIGS. 1-4 Paragraph 0025
a signal processor (140) for determining (230, 432) a path loss for a radio channel between a base station (120) and the remote transceiver; and	FIGS. 2, 4 Paragraphs 0024, 0025, 0063-0066
a receiver arranged to receive, on a shared physical channel (416) used to carry allocation and scheduling information from the base station, an allocation of a scheduled uplink transmission resource (402) and transmit power control (TPC) command (418);	FIG. 4 Paragraphs 0033, 0065
wherein the signal processor is arranged to calculate (436) a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.	FIG. 4 Paragraphs 0024, 0066-0072

Independent Claim 50

Reference Characters	Specification Paragraph Numbers Figure Numbers
A base station (120) for supporting power control in a radio communication system, the base station comprising:	FIGS. 1-4 Paragraph 0025
a transmitter (120) arranged to transmit, on a shared physical channel (416) used to carry allocation and scheduling information, to a remote transceiver (140), an allocation of a scheduled uplink transmission resource (402) and transmit power control (TPC) command (418);	FIG. 4 Paragraphs 0025, 0033, 0065
and a receiver (120) arranged to receive an uplink signal from the remote transceiver at a calculated (436) transmit power level based on a path loss (230, 432) and the TPC command.	FIGS. 2, 4 Paragraphs 0066-0072

(6) Grounds of Rejection to be Reviewed on Appeal

Claim 26 was objected to. Claims 26, 28, 30-34, and 46-48 are rejected under 35 U.S.C. 101. Claims 26, 28, 30-34, and 46-48 are rejected under 35 U.S.C. § 112, first paragraph. Claims 1-4, 7, 15, 26, 28, 32, 33, 43, 46, 49, and 50 were rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) ("Zeira") in view of Chen et al. (US Pub. No. 2005/0025056) ("Chen") and further in view of Van Lieshout et al. (US Pub. No. 2001/0036823) ("Lieshout").

(7) Argument

Objections

The Examiner noted a informality in claim 26. We agree with the Examiner's observation and we have submitted a post-final amendment and response to cure this informality. This post-final amendment was submitted simultaneously with this Appeal Brief and hence we do not know the present status of this amendment. For purposes of this Brief we presume entry of that amendment.

Rejections under 35 U.S.C. § 112, first paragraph

Claims 26, 28, 30-34, and 46-48 were rejected under 35 U.S.C. § 112, first paragraph. The Examiner's specific concern is expressed as follows[2]:

> Regarding claims 26 and 46, Applicant recites the limitations "A remote transceiver or A base station for a cellular communication system, the remote transceiver or the base station having a computer program stored therein" is not disclose in the Specification.

Paragraph 0024 of our specification as originally filed, however, reads as follows:

> **[0024]** Some portions of the detailed description which follows are presented in terms of procedures, steps, logic blocks, processing, and other symbolic representations of operations on data bits that can be performed on computer memory. A procedure, computer executed step, logic block, process etc., are here conceived to be a self-consistent sequence of steps or instructions leading to a desired result. The steps are those utilizing physical manipulations of physical quantities. These quantities can take the form of electrical, magnetic, or radio signals capable of being stored, transferred, combined, compared, and otherwise manipulated in a computer system. These signals may be referred to at times as bits, values, elements, symbols, characters, terms, numbers, or the like. Each step may be performed by hardware, software, firmware, or combinations thereof.

---

2 Final Rejection at page 3, section 5.

Accordingly, we respectfully observe that all of the steps described in the specification, whether described as being carried out by a base station or by the remote transceiver, have been specifically presented as being doable via a corresponding computer system, computer memory, hardware, firmware, and/or computer execution. We therefore submit that the specification provides more than sufficient support for the reference in these claims to the execution of the described steps via a computer program that is stored at one or the other of the base station and remote transceiver.

Rejections under 35 U.S.C. § 101

Claims 26, 28, 30-34, and 46-48 were rejected under 35 U.S.C. 101.

Independent claim 26 begins as follows:

> "A remote transceiver for a cellular communication system, the remote transceiver having a computer program stored therein and further for supporting power control in a radio communication system, the computer program comprising instructions for:"

In turn, independent claim 46 begins as follows:

> "A base station for a cellular communication system, the base station having a computer program stored therein and further for controlling power in a radio communication system, the computer program comprising instructions for:"

The Examiner expresses the basis for this rejection as follows[3]:

3 Final Rejection at page 2, section 3.

> Claims 26,28,30-34 and 46-48 recite "A remote transceiver or A base station for a cellular communication system, the remote transceiver or the base station having a computer program stored therein". In the specification, paragraph 0026, recites "A procedure, computer executed step, logic block, process etc., are here conceived to be a self-consistent sequence of steps or instructions leading to a desired result. The steps are those utilizing physical manipulations of physical quantities. These quantities can take the form of electrical, magnetic, or radio signals capable of being stored, transferred, combined, compared, and otherwise manipulated in a computer system. These signals may be referred to at times as bits, values, elements, symbols, characters, terms, numbers, or the like". So treating claim 26-39 and 46-48 as a whole, it is effectively claiming a signal. Signal does not within any of the statutory categories, thus, not statutory (See MPEP 2100, In re Nuitjen, Docket no. 2006-1371 (Fed. Cir. Sept 20, 2007)(slip. Op. at 18)). Applicant is advised to delete the above underlying part from the specification because of "claiming signals".

With all due respect, the Examiner's analysis is flawed and does not represent an appropriate approach under 35 U.S.C. 101. The simple fact is that none of these claims are process claims but rather are claims to a manufacture or machine (with independent claim 26 comprising a "remote transceiver" and independent claim 46 comprising a "base station"). Just as clearly these claims are not, as suggested by the Examiner, nothing more than effective surrogates for "signals" that are not, in and of themselves, suitable subject matter under 35 U.S.C. 101.

Accordingly, and with all due respect, these claims readily pass muster under 35 U.S.C. 101.

Rejections under 35 U.S.C. § 102(b)

Not applicable

Rejections under 35 U.S.C. § 103(a)

Claims 1-4, 7, 15, 26, 28, 32, 33, 43, 46, 49, and 50 were rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira in view of Chen and further in view of Van Lieshout. All of our independent claims (1, 26, 43, 46, 49, and 50) can be treated as a single group for purposes of this appeal.

Simply put, the Van Lieshout reference does not teach allocating a scheduled uplink transmission resource and TCP command on a shared physical channel that is also used to carry allocation and scheduling information from a base station to a remote transceiver.

Our claim 1, for example, specifies that a remote transceiver receives "an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command" on "a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver." The Examiner agrees that neither Zeira nor Chen disclose such a thing. The Examiner then seeks to rely upon the Van Lieshout reference to supplant this missing content.

The Examiner's specific interpretation of Van Lieshout reads as follows:

> However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel*).

Van Lieshout's paragraph 0006 as relied upon by the Examiner reads as follows:

> [0006] In one example implementation of the present invention, a computer-generated data signal, (e.g., generated in a computer in the DRNC), is transported on a separate transport bearer between the DRNC and the base station having a particular format. A frame number field includes a specific frame number identifying a frame on the shared radio channel. A transport format indicator field includes information relating to a particular radio channel resource in the corresponding frame. In one example implementation, the transport format indicator field includes an index to a transport format table previously stored in the mobile radio unit. In other words, the index addresses particular entries in the look-up table so the mobile can retrieve certain information that will allow it to receive and decode information intended for that mobile radio unit on the shared radio channel. For example, since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel.

We acknowledge that Van Lieshout does refer to a "shared radio channel" in this paragraph. This shared radio channel, however, does *not* convey allocation and scheduling information. Instead, as Van Lieshout discloses elsewhere in his specification, Van Lieshout uses a dedicated (and *non-shared*) downlink channel to convey downlink information of this sort. Van Lieshout further discloses that this dedicated non-shared downlink channel is used to convey such information as relates to downlink (and not uplink) shared resources.

Our claim 1, however, specifies, "on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command." In making his rejection, the Examiner misses the point that Van Lieshout discloses sending his allocation and scheduling information to a transceiver on a downlink *dedicated* (and hence not shared) channel, with his follow-on data (which is distinctly not the allocation and scheduling information) then being sent on a *downlink* shared channel. As a result, Van Lieshout plainly and wholly fails to teach sending uplink allocation and scheduling information on a shared channel as specified by our claims.

Our dependent claims 2-4, 7, 15, 28, 32, 33, and 43 are all ultimately dependent upon one of the independent claims shown above to be allowable. While we believe that other arguments are available to highlight the allowable subject matter presented in various ones of these dependent claims, we also believe that the comments set forth herein regarding allowability of the independent claims are sufficiently compelling to warrant present exclusion of such additional points for the sake of brevity and expedited consideration.

Accordingly we respectfully seek reversal of the Examiner's rejections of claims 1-4, 7, 8, 15-17, 26, 28, 30-34, and 43-50.

Respectfully submitted,

FITCH, EVEN, TABIN & FLANNERY

(8) Claims Appendix

1. A method of power control in a radio communication system, the method comprising, at a remote transceiver:

determining a path loss for a radio channel between a base station and the ~~a~~ remote transceiver; and

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

calculating at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

2. The method of power control of claim 1, the method further comprising transmitting an uplink signal at the calculated transmit power level.

3. The method of power control of claim 1, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

4. The method of power control of claim 3, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level.

7. The method of power control of claim 2, wherein the calculated transmit power level is based on a spreading factor parameter.

8. The method of power control of claim 2, wherein the calculated transmit power level is based on parameters associated with a selected transport format.

15. The power control method of claim 1, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command.

16. The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

17. The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

26. A remote transceiver for a cellular communication system, the remote transceiver having a computer program stored therein and further for supporting power control in a radio communication system, the computer program comprising instructions for:

determining a path loss for a radio channel between a base station and
the remote transceiver;

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command;

calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command.

28. The remote transceiver of claim 26, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

30. The remote transceiver of claim 26, the computer program further comprising instructions for receiving a signal from the base station for instructing the remote transmitter to utilize the accumulated TPC command only when calculating the transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

31. The remote transceiver of claim 26, the computer program further comprising instructions for receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when calculating the transmit power level, thereby disabling use of closed loop power control and enabling use of open loop power control only.

32. The remote transceiver of claim 26, the computer program further comprising instructions for transmitting an uplink signal from the remote transceiver at the calculated transmit power level.

33. The remote transceiver of claim 26, wherein calculating the transmit power level is additionally based on a spreading factor parameter.

34. The remote transceiver of claim 26, wherein calculating the transmit power level is additionally based on parameters associated with a selected transport format.

43. A method of power control in a radio communications system, the method comprising, at a base station:

on a shared physical channel used to carry allocation and scheduling information from the base station to a remote transceiver, sending an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

44. The power control method of claim 43, further comprising sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

45. The power control method of claim 43, further comprising sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

46. A base station for a cellular communication system, the base station having a computer program stored therein and further for controlling power in a radio communication system, the computer program comprising instructions for:

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

47. The base station of claim 46, the computer program further comprising instructions for

sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

48. The base station of claim 46, the computer program further comprising instructions for sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

49. A remote transceiver for supporting power control in a radio communication system, the remote transceiver comprising:

a signal processor for determining a path loss for a radio channel between a base station and the remote transceiver; and

a receiver arranged to receive, on a shared physical channel used to carry allocation and scheduling information from the base station, an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; wherein

the signal processor is arranged to calculate a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

50. A base station for supporting power control in a radio communication system, the base station comprising:

a transmitter arranged to transmit, on a shared physical channel used to carry allocation and scheduling information, to a remote transceiver, an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

a receiver arranged to receive an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

AMENDMENT B AND RESPONSE

Sir:

Applicants hereby petition under 37 CFR § 1.136(a) for a three-month extension of time in the above-identified application, up to and including December 3, 2010, to make this reply timely.

Please amend the above-identified patent application as follows:

Amendments to the Claims are reflected in the listing of claims beginning on page 2 of this paper; and

Remarks begin on page 8 of this paper.

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously Presented): A method of power control in a radio communication system, the method comprising, at a remote transceiver:

determining a path loss for a radio channel between a base station and the remote transceiver; and

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

calculating at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

2. (Previously Presented): The method of power control of claim 1, the method further comprising transmitting an uplink signal at the calculated transmit power level.

3. (Original): The method of power control of claim 1, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

4. (Original): The method of power control of claim 3, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level.

5-6. (Canceled)

7. (Original): The method of power control of claim 2, wherein the calculated transmit power level is based on a spreading factor parameter.

8. (Previously Presented): The method of power control of claim 2, wherein the calculated transmit power level is based on parameters associated with a selected transport format.

9.-14. (Canceled)

15. (Previously presented): The power control method of claim 1, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command.

16. (Previously presented): The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

17. (Previously presented): The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

18-25. (Cancelled)

26. (Currently amended): A remote transceiver for a cellular communication system, the remote transceiver having a computer program stored therein and further for supporting power control in a

radio communication system, the computer program comprising instructions for:

determining a path loss for a radio channel between a base station and the remote transceiver; ~~and~~

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command; and

calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command.

27. (Cancelled)

28. (Previously Presented): The remote transceiver of claim 26, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and measuring a received power level of the downlink signal.

29. (Cancelled)

30. (Previously Presented): The remote transceiver of claim 26, the computer program further comprising instructions for receiving a signal from the base station for instructing the remote transmitter to utilize the accumulated TPC command only when calculating the transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

31. (Previously Presented): The remote transceiver of claim 26, the computer program further comprising instructions for receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when calculating the transmit power level, thereby disabling use of closed loop power control and enabling use of open loop power

control only.

32. (Previously Presented): The remote transceiver of claim 26, the computer program further comprising instructions for transmitting an uplink signal from the remote transceiver at the calculated transmit power level.

33. (Previously Presented): The remote transceiver of claim 26, wherein calculating the transmit power level is additionally based on a spreading factor parameter.

34. (Previously Presented): The remote transceiver of claim 26, wherein calculating the transmit power level is additionally based on parameters associated with a selected transport format.

35.- 42. (Cancelled)

43. (Previously Presented): A method of power control in a radio communications system, the method comprising, at a base station:

on a shared physical channel used to carry allocation and scheduling information from the base station to a remote transceiver, sending an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

44. (Previously presented): The power control method of claim 43, further comprising sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

45. (Previously presented): The power control method of claim 43, further comprising sending a

signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

46. (Previously Presented): A base station for a cellular communication system, the base station having a computer program stored therein and further for controlling power in a radio communication system, the computer program comprising instructions for:

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

47. (Previously Presented): The base station of claim 46, the computer program further comprising instructions for sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

48. (Previously Presented): The base station of claim 46, the computer program further comprising instructions for sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

49. (Previously Presented) A remote transceiver for supporting power control in a radio communication system, the remote transceiver comprising:

a signal processor for determining a path loss for a radio channel between a base station and the remote transceiver; and

a receiver arranged to receive, on a shared physical channel used to carry allocation and scheduling information from the base station, an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; wherein

the signal processor is arranged to calculate a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

50. (Previously Presented) A base station for supporting power control in a radio communication system, the base station comprising:

a transmitter arranged to transmit, on a shared physical channel used to carry allocation and scheduling information, to a remote transceiver, an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

a receiver arranged to receive an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

REMARKS

In an Office Communication dated January 8, 2010 as entered in the above-captioned matter, the Examiner noted an informality in claim 26. We agree with the Examiner's observation and submit this post-final amendment to cure this informality. This correction does not raise new substantive issues, will not create a need for a new search, and will place the claims in better condition for allowance and/or appeal.

If there is any other issue that may be resolved, the Examiner is respectfully requested to telephone the undersigned.

Respectfully submitted,

Fitch, Even, Tabin & Flannery

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

<u>New Applications Under 35 U.S.C. 111</u>
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

<u>National Stage of an International Application under 35 U.S.C. 371</u>
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

<u>New International Application Filed with the USPTO as a Receiving Office</u>
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Please find below and/or attached an Office communication concerning this application or proceeding.

Notification of Non-Compliant Appeal Brief (37 CFR 41.37)	Application No.	Applicant(s)	
	10/917,968	Anderson	
	Examiner	Art Unit	
	Rego	2618	

--The MAILING DATE of this communication appears on the cover sheet with the correspondence address--

The Appeal Brief filed on 03 December 2010 is defective for failure to comply with one or more provisions of 37 CFR 41.37.

To avoid dismissal of the appeal, applicant must file anamended brief or other appropriate correction (see MPEP 1205.03) within **ONE MONTH or THIRTY DAYS** from the mailing date of this Notification, whichever is longer. **EXTENSIONS OF THIS TIME PERIOD MAY BE GRANTED UNDER 37 CFR 1.136.**

1. ☐ The brief does not contain the items required under 37 CFR 41.37(c), or the items are not under the proper heading or in the proper order.

2. ☐ The brief does not contain a statement of the status of all claims, (e.g., rejected, allowed, withdrawn, objected to, canceled), or does not identify the appealed claims (37 CFR 41.37(c)(1)(iii)).

3. ☐ At least one amendment has been filed subsequent to the final rejection, and the brief does not contain a statement of the status of each such amendment (37 CFR 41.37(c)(1)(iv)).

4. ☐ (a) The brief does not contain a concise explanation of the subject matter defined in each of the independent claims involved in the appeal, referring to the specification by page and line number and to the drawings, if any, by reference characters; and/or (b) the brief fails to: (1) identify, for each independent claim involved in the appeal and for each dependent claim argued separately, every means plus function and step plus function under 35 U.S.C. 112, sixth paragraph, and/or (2) set forth the structure, material, or acts described in the specification as corresponding to each claimed function with reference to the specification by page and line number, and to the drawings, if any, by reference characters (37 CFR 41.37(c)(1)(v)).

5. ☐ The brief does not contain a concise statement of each ground of rejection presented for review (37 CFR 41.37(c)(1)(vi))

6. ☐ The brief does not present an argument under a separate heading for each ground of rejection on appeal (37 CFR 41.37(c)(1)(vii)).

7. ☒ The brief does not contain a correct copy of the appealed claims as an appendix thereto (37 CFR 41.37(c)(1)(viii)).

8. ☐ The brief does not contain copies of the evidence submitted under 37 CFR 1.130, 1.131, or 1.132 or of any other evidence entered by the examiner **and relied upon by appellant in the appeal**, along with a statement setting forth where in the record that evidence was entered by the examiner, as an appendix thereto (37 CFR 41.37(c)(1)(ix)).

9. ☐ The brief does not contain copies of the decisions rendered by a court or the Board in the proceeding identified in the Related Appeals and Interferences section of the brief as an appendix thereto (37 CFR 41.37(c)(1)(x)).

10. ☒ Other (including any explanation in support of the above items):

7. Claim 26 is missing the word (and) at the end of the 3rd paragraph as amendment on 12/03/10 filed with the Appeal Brief. An entire brief is not required, only the corrected section.

RESPONSE TO NOTIFICATION OF NON-COMPLIANT APPEAL BRIEF

Sir:

Pursuant to a Notice of Non-Compliant Appeal Brief as mailed on December 10, 2010 in the above-captioned matter, the Applicant's Appeal Brief was faulted as not containing a correct copy of the appealed claims appendix of that document. In particular, the Notification identified Claim 26 as missing the word "and" at a particular location therein. The Notification then indicated that, "an entire brief is not required, only the corrected section."

We hereby submit a Substitute Claims Appendix with Claim 26 now including the identified "and."

Respectfully submitted,

Fitch, Even, Tabin & Flannery

Date: December 17, 2010

(8) Claims Appendix

1. A method of power control in a radio communication system, the method comprising, at a remote transceiver:

determining a path loss for a radio channel between a base station and the ~~a~~remote transceiver; and

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

calculating at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

2. The method of power control of claim 1, the method further comprising transmitting an uplink signal at the calculated transmit power level.

3. The method of power control of claim 1, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and

measuring a received power level of the downlink signal.

4. The method of power control of claim 3, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level.

7. The method of power control of claim 2, wherein the calculated transmit power level is based on a spreading factor parameter.

8. The method of power control of claim 2, wherein the calculated transmit power level is based on parameters associated with a selected transport format.

15. The power control method of claim 1, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command.

16. The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

17. The power control method of claim 15, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

26. A remote transceiver for a cellular communication system, the remote transceiver having a computer program stored therein and further for supporting power control in a radio communication system, the computer program comprising instructions for:

determining a path loss for a radio channel between a base station and the remote transceiver;

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command; and

calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command.

28. The remote transceiver of claim 26, wherein determining the path loss includes:

receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and measuring a received power level of the downlink signal.

30. The remote transceiver of claim 26, the computer program further comprising instructions for receiving a signal from the base station for instructing the remote transmitter to utilize the accumulated TPC command only when calculating the transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

31. The remote transceiver of claim 26, the computer program further comprising instructions for receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when calculating the transmit power level, thereby disabling use of closed loop power control and enabling use of open loop power control only.

32. The remote transceiver of claim 26, the computer program further comprising instructions for transmitting an uplink signal from the remote transceiver at the calculated transmit power level.

33. The remote transceiver of claim 26, wherein calculating the transmit power level is additionally based on a spreading factor parameter.

34. The remote transceiver of claim 26, wherein calculating the transmit power level is additionally based on parameters associated with a selected transport format.

43. A method of power control in a radio communications system, the method comprising, at a base station:

on a shared physical channel used to carry allocation and scheduling information from the base station to a remote transceiver, sending an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

44. The power control method of claim 43, further comprising sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

45. The power control method of claim 43, further comprising sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

46. A base station for a cellular communication system, the base station having a computer program stored therein and further for controlling power in a radio communication system, the computer program comprising instructions for:

on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource and a transmit power control (TPC) command; and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

47. The base station of claim 46, the computer program further comprising instructions for sending a signal to the remote transceiver for instructing the remote transmitter to utilize only the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to disable use of open loop power control and enable use of closed loop power control only.

48. The base station of claim 46, the computer program further comprising instructions for sending a signal from the base station to the remote transceiver for instructing the remote transmitter to disregard the TPC commands when deriving the calculated transmit power level, thereby instructing the remote transmitter to enable use of open loop power control only and disable use of closed loop power control.

49. A remote transceiver for supporting power control in a radio communication system, the remote transceiver comprising:

a signal processor for determining a path loss for a radio channel between a base station and the remote transceiver; and

a receiver arranged to receive, on a shared physical channel used to carry allocation and scheduling information from the base station, an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; wherein

the signal processor is arranged to calculate a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

50. A base station for supporting power control in a radio communication system, the base station comprising:

a transmitter arranged to transmit, on a shared physical channel used to carry allocation and scheduling information, to a remote transceiver, an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and

a receiver arranged to receive an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these record s.

2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.

3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.

4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).

5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.

6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).

7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.

8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.

9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

(54) Outer loop/weighted open loop power control in a time division duplex communication system

(57) Outer loop/weighted open loop power control controls transmission power levels in a spread spectrum time division duplex communication station. A first communication station (110) transmits a communication to a second communication station including target adjustment information generated at the first station on the basis of measured error rates of communications from the second station to the first station. The second station receives the communication and measures its received power level. Bases on in part the received communication's power level and the communication's transmission power level, a path loss estimate is determined. A quality of the path loss estimate is also determined. The transmission power level for a communication from the second station to the first stations is based on in part weighting the path loss estimate in response to the estimate's quality and based on the receive target adjusted by the target adjustment information transmitted from the first station.

Description

BACKGROUND

[0001] This invention generally relates to spread spectrum time division duplex (TDD) communication systems. More particularly; the present invention relates to a system and method for controlling transmission power within TDD communication systems.

[0002] **Figure 1** depicts a wireless spread spectrum time division duplex (TDD) communication system. The system has a plurality of base stations $\mathbf{30_1}$-$\mathbf{30_7}$.Each base station $\mathbf{30_1}$ communicates with user equipment (UEs) $\mathbf{32_1}$-$\mathbf{32_3}$ in its operating area. Communications transmitted from a base station $\mathbf{30_1}$ to a UE $\mathbf{32_1}$ are referred to as downlink communications and communications transmitted from a UE $\mathbf{32_1}$ to a base station $\mathbf{30_1}$ are referred to as uplink communications.

[0003] In addition to communicating over different frequency spectrums, spread spectrum TDD systems carry multiple communications over the same spectrum. The multiple signals are distinguished by their respective chip code sequences (codes). Also, to more efficiently use the spread spectrum, TDD systems as illustrated in **Figure 2** use repeating frames **34** divided into a number of time slots $\mathbf{36_1}$-$\mathbf{36_n}$, such as sixteen time slots. In such systems, a communication is sent in selected time slots $\mathbf{36_1}$-$\mathbf{36_n}$ using selected codes. Accordingly, one frame **34** is capable of carrying multiple communications distinguished by both time slot and code. The combination of a single code in a single time slot is referred to as a resource unit. Based on the bandwidth required to support a communication, one or multiple resource units are assigned to that communication.

[0004] Most TDD systems adaptively control transmission power levels. In a TDD system, many communications may share the same time slot and spectrum. When a UE $\mathbf{32_1}$ or base station $\mathbf{30_1}$ is receiving a specific communication, all the other communications using the same time slot and spectrum cause interference to the specific communication. Increasing the transmission power level of one communication degrades the signal quality of all other communications within that time slot and spectrum. However, reducing the transmission power level too far results in undesirable signal to noise ratios (SNRs) and bit error rates (BERs) at the receivers. To maintain both the signal quality of communications and low transmission power levels, transmission power control is used.

[0005] One approach using transmission power control in a code division multiple access (CDMA) communication system is described in U.S. Patent No. 5,056,109 (Gilhousen et al.). A transmitter sends a communication to a particular receiver. Upon reception, the received signal power is measured. The received signal power is compared to a desired received signal power. Based on the comparison, a control bit is sent to the transmitter either increasing or decreasing transmission power by a fixed amount. Since the receiver sends a control signal to the transmitter to control the transmitter's power level, such power control techniques are commonly referred to as closed loop.

[0006] Under certain conditions, the performance of closed loop systems degrades. For instance, if communications sent between a UE and a base station are in a highly dynamic environment, such as due to the UE moving, such systems may not be able to adapt fast enough to compensate for the changes. The update rate of closed loop power control in TDD is typically 100 cycles per second which is not sufficient for fast fading channels. Accordingly, there is a need for alternate approaches to maintain signal quality and low transmission power levels.

SUMMARY

[0007] Outer loop/weighted open loop power control controls transmission power levels in a spread spectrum time division duplex communication system. At a first communication station, errors are measured in a received communication from a second communication station. Based on in part the measured errors, an adjustment in a target level is determined. The first station transmits a communication and the target adjustment to the second station. The second station measures the first station's communication's received power level. Based on in part the received power level, a path loss is determined. The target level is adjusted in response to receiving the target adjustment. The quality of the path loss is determined with respect to a subsequent communication to be transmitted from the second station. The second station's transmission power level for the subsequent communication is adjusted based on in part the determined path loss, the determined quality and the adjusted target level.

BRIEF DESCRIPTION OF THE DRAWINGS

[0008]

Figure 1 illustrates a prior art TDD system.
Figure 2 illustrates time slots in repeating frames of a TDD system.
Figure 3 is a flow chart of outer loop/weighted open loop power control.
Figure 4 is a diagram of components of two communication stations using outer loop/weighted open loop power

control.

Figure 5 is a graph of the performance of outer loop/weighted open loop, weighted open loop and closed loop power control systems.

Figure 6 is a graph of the three systems performance in terms of Block Error Rate (BLER).

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0009] The preferred embodiments will be described with reference to the drawing figures where like numerals represent like elements throughout. Outer loop/weighted open loop power control will be explained using the flow chart of **Figure 3** and the components of two simplified communication stations **110,112** as shown in **Figure 4.** For the following discussion, the communication station having its transmitter's power controlled is referred to as the transmitting station **112** and the communication station receiving power controlled communications is referred to as the receiving station **110.** Since outer loop/weighted open loop power control may be used for uplink, downlink or both types of communications, the transmitter having its power controlled may be associated with the base station **30_1**, UE **32_1** or both. Accordingly, if both uplink and downlink power control are used, the receiving and transmitting station's components are associated with both the base station **30_1** and UE **32_1**.

[0010] The receiving station **110** receives various radio frequency signals including communications from the transmitting station **112** using an antenna **78**, or alternately, an antenna array, **step 38**. The received signals are passed thorough an isolator **66** to a demodulator **68** to produce a baseband signal. The baseband signal is processed, such as by a channel estimation device **70** and a data estimation device **72**, in the time slots and with the appropriate codes assigned to the transmitting station's communication. The channel estimation device **70** commonly uses the training sequence component in the baseband signal to provide channel information, such as channel impulse responses. The channel information is used by the data estimation device **72,** the interference measurement device **74,** and the transmit power calculation device **76.** The data estimation device **72** recovers data from the channel by estimating soft symbols using the channel information.

[0011] Prior to transmission of the communication from the transmitting station **112,** the data signal of the communication is error encoded using an error detection/correction encoder **110.** The error encoding scheme is typically a circular redundancy code (CRC) followed by a forward error correction encoding, although other types of error encoding schemes may be used.

[0012] Using the soft symbols produced by the data estimation device **72,** an error detection device **112** detects errors in the soft symbols. A processor **111** analyzes the detected error and determines an error rate for the received communication, step 39. Based on the error rate, the processor **111** determines the amount, if any, a target level, such as a target signal to interference ration (SIR_{TARGET}),needs to be changed at the transmitting station **112**, **step 40.** Based on the determined amount, a target adjustment signal is generated by the target adjustment generator **114**. The target adjustment is subsequently sent to the transmitting station, **step 41**. The target adjustment is signaled to the transmitting station **112,** such as using a dedicated or a reference channel as shown in **Figure 4, step 41.**

[0013] One technique to determine the amount of adjustment in the target level uses an upper and lower threshold. If the determined error rate exceeds an upper threshold, the target level is set at an unacceptably low level and needs to be increased. A target level adjustment signal is sent indicating an increase in the target level. If the determined error rate is below a second threshold, the target level is set at an unnecessarily high level and the target level can be decreased. By reducing the target level, the transmitting station's power level is decreased reducing interference to other communications using the same time slot and spectrum. To improve performance, as soon as the error rate exceeds the upper limit, a target adjustment is sent. As a result, high error rates are improved quickly and lower error rates are adjusted slowly, such as once per 10 seconds. If the error rate is between the thresholds, a target adjustment is not sent maintaining the same target level.

[0014] Applying the above technique to a system using CRC and FEC encoding follows. Each CRC block is checked for an error. Each time a frame is determined to have an error, a counter is incremented. As soon as the counter exceeds an upper threshold, such as 1.5 to 2 times the desired block error rate (BLER), a target adjustment is sent increasing the target level. To adjust the SIR_{TARGET} at the transmitting station **112,** the increase in the SIR_{TARGET} is sent (SIR_{INC}), which is typically in a range of 0.25 dB to 4 dB. If the number of CRC frames encountered exceeds a predetermined limit, such as 1000 blocks, the value of the counter is compared to a lower threshold, such as 0.2 to 0.6 times the desired BLER. If the number of counted block errors is below the lower threshold, a target adjustment signal is sent decreasing the target level, SIR_{DEC}. A typical range of SIR_{DEC} is 0.25 to 4 dB. The value of SIR_{DEC}may be based on $SIR_{INC}$and a target block error rate, $BLER_{TARGET}$.The $BLER_{TARGET}$is based on the type of service. A typical range for the $BLER_{TARGET}$is 0.1% to 10%. **Equation 1** illustrates one such approach for determining SIR_{DEC}.

$$SIR_{DEC} = SIR_{INC} \times BLER_{TARGET}/(1 - BLER_{TARGET}) \quad \text{Equation 1}$$

[0015] If the count is between the thresholds for the predetermined block limit, a target adjustment signal is not sent.

[0016] Alternately, a single threshold may be used. If the error rate exceeds the threshold, the target level is increased. If the error rate is below the threshold, the target is decreased. Additionally, the target level adjustment signal may have several adjustment levels, such as from 0 dB to ±4 dB in 0.25 dB increments based on the difference between the determined error rate and the desired error rate.

[0017] The interference measurement device **74** of the receiving station **110** determines the interference level in dB, I_{RS}, within the channel, based on either the channel information, or the soft symbols generated by the data estimation device **72**, or both. Using the soft symbols and channel information, the transmit power calculation device **76** controls the receiving station's transmission power level by controlling the gain of an amplifier **54.**

[0018] For use in estimating the pathloss between the receiving and transmitting stations **110,112** and sending data, the receiving station **110** sends a communication to the transmitting station **112, step 41**. The communication may be sent on any one of the various channels. Typically, in a TDD system, the channels used for estimating pathloss are referred to as reference channels, although other channels may be used. If the receiving station **110** is a base station **30$_1$**, the communication is preferably sent over a downlink common channel or a common control physical channel (CCPCH). Data to be communicated to the transmitting station **112** over the reference channel is referred to as reference channel data. The reference data may include, as shown, the interference level, I_{RS}, multiplexed with other reference data, such as the transmission power level, T_{RS}. The interference level, I_{RS}, and reference channel power level, I_{RS}, may be sent in other channels, such as a signaling channel.

[0019] The reference channel data is generated by a reference channel data generator **56.** The reference data is assigned one or multiple resource units based on the communication's bandwidth requirements. A spreading and training sequence insertion device **58** spreads the reference channel data and makes the spread reference data time-multiplexed with a training sequence in the appropriate time slots and codes of the assigned resource units. The resulting sequence is referred to as a communication burst. The communication burst is subsequently amplified by an amplifier **60.** The amplified communication burst may be summed by a sum device **62** with any other communication burst created through devices, such as a data generator **50,** spreading and training sequence insertion device **52** and amplifier **54.**

[0020] The summed communication bursts are modulated by a modulator **64.** The modulated signal is passed thorough an isolator **66** and radiated by an antenna **78** as shown or, alternately, through an antenna array. The radiated signal is passed through a wireless radio channel **80** to an antenna **82** of the transmitting station **112.** The type of modulation used for the transmitted communication can be any of those known to those skilled in the art, such as direct phase shift keying (DPSK) or quadrature phase shift keying (QPSK).

[0021] The antenna **82** or, alternately, antenna array of the transmitting station **112** receives various radio frequency signals including the target adjustments. The received signals are passed through an isolator **84** to a demodulator **86** to produce a baseband signal. The baseband signal is processed, such as by a channel estimation device **88** and a data estimation device **90,** in the time slots and with the appropriate codes assigned to the communication burst of the receiving station **110.** The channel estimation device **88** commonly uses the training sequence component in the baseband signal to provide channel information, such as channel impulse responses. The channel information is used by the data estimation device **90** and a power measurement device **92.**

[0022] The power level of the processed communication corresponding to the reference channel, R_{TS}, is measured by the power measurement device **92** and sent to a pathloss estimation device **94, step 42.** Both the channel estimation device **88** and the data estimation device **90** are capable of separating the reference channel from all other channels. If an automatic gain control device or amplifier is used for processing the received signals, the measured power level is adjusted to correct for the gain of these devices at either the power measurement device **92** or pathloss estimation device **94**. The power measurement device is a component of an outer loop/weighted open loop controller **100**. As shown in **Figure 4,** the outer loop/weighted open loop controller **100** comprises the power measurement device **92,** pathloss estimation device **94**, quality measurement device **94,** target update device **101**, and transmit power calculation device **98**.

[0023] To determine the path loss, L, the transmitting station **112** also requires the communication's transmitted power level, T_{RS}. The communication's transmitted power level, T_{RS}, may be sent along with the communication's data or in a signaling channel. If the power level, T_{RS}, is sent along with the communication's data, the data estimation device **90** interprets the power level and sends the interpreted power level to the pathloss estimation device **94**. If the receiving station **110** is a base station **30$_1$**, preferably the transmitted power level, T_{RS}, is sent via the broadcast channel (BCH) from the base station **30$_1$**. By subtracting the received communication's power level, R_{TS}, from the sent communication's transmitted power level, T_{RS}, the pathloss estimation device **94** estimates the path loss, L, between the two stations **110,112, step 43.** Additionally, a long term average of the pathloss, L_0, is updated, **step 44.** The long term average of the pathloss, L_0, is an average of the pathloss estimates. In certain situations, instead of transmitting the transmitted power level, T_{RS}, the receiving station **110** may transmit a reference for the transmitted power level. In that case, the pathloss estimation device **94** provides reference levels for the pathloss, L.

[0024] Since TDD systems transmit downlink and uplink communications in the same frequency spectrum, the conditions these communications experience are similar. This phenomenon is referred to as reciprocity. Due to reciprocity, the path loss experienced for the downlink will also be experienced for the uplink and vice versa. By adding the estimated path loss to a target level, a transmission power level for a communication from the transmitting station **112** to the receiving station **110** is determined.

[0025] If a time delay exists between the estimated path loss and the transmitted communication, the path loss experienced by the transmitted communication may differ from the calculated loss. In TDD where communications are sent in differing time slots **36_1-36_n**, the time slot delay between received and transmitted communications may degrade the performance of an open loop power control system. To overcome these drawbacks, weighted open loop power control determines the quality of the estimated path loss using a quality measurement device **96, step 45,** and weights the estimated path loss accordingly, L, and long term average of the pathloss, L_0.

[0026] To enhance performance further in outer loop/weighted open loop, a target level is adjusted. A processor **103** converts the soft symbols produced by the data estimation device **90** to bits and extracts the target adjustment information, such as a SIR_{TARGET} adjustment. A target update device **101** adjusts the target level using the target adjustments, **step 46.** The target level may be a SIR_{TARGET} or a target received power level at the receiving station **110**.

[0027] The transmit power calculation device **98** combines the adjusted target level with the weighted path loss estimate, L, and long term average of the pathloss estimate, L_0, to determine the transmission power level of the transmitting station, **step 47**.

[0028] Data to be transmitted in a communication from the transmitting station **112** is produced by data generator **102.** The data is error detection/correction encoded by error detection/correction encoder **110.** The error encoded data is spread and time-multiplexed with a training sequence by the training sequence insertion device **104** in the appropriate time slots and codes of the assigned resource units producing a communication burst. The spread signal is amplified by an amplifier **106** and modulated by modulator **108** to radio frequency. The gain of the amplifier is controlled by the transmit power calculation device **98** to achieve the determined transmission power level. The power controlled communication burst is passed through the isolator **84** and radiated by the antenna **82**.

[0029] The following is one outer loop/weighted open loop power control algorithm. The transmitting stations's transmission power level in decibels, P_{TS}, is determined using **Equation 2.**

$$P_{TS} = SIR_{TARGET} + I_{RS} + \alpha(L-L_0) + L_0 + \text{CONSTANT VALUE} \qquad \text{Equation 2}$$

[0030] The SIR_{TARGET} has an adjusted value based on the received target adjustment signals. For the downlink, the initial value of SIR_{TARGET} is known at the transmitting station **112.** For uplink power control, SIR_{TARGET} is signaled from the receiving station **110** to the transmitting station **112.** Additionally, a maximum and minimum value for an adjusted SIR_{TARGET} may also be signaled. The adjusted SIR_{TARGET} is limited to the maximum and minimum values. I_{RS} is the measure of the interference power level at the receiving station **110.**

[0031] L is the path loss estimate in decibels, T_{RS} - R_{TS}, for the most recent time slot **36_1-36_n** that the path loss was estimated. L_0, the long term average of the path loss in decibels, is the running average of the pathloss estimate, L. The CONSTANT VALUE is a correction term. The CONSTANT VALUE corrects for differences in the uplink and downlink channels, such as to compensate for differences in uplink and downlink gain. Additionally, the CONSTANT VALUE may provide correction if the transmit power reference level of the receiving station is transmitted, instead of the actual transmit power, T_{RS}. If the receiving station **110** is a base station, the CONSTANT VALUE is preferably sent via a Layer 3 message.

[0032] The weighting value, α, is a measure of the quality of the estimated path loss and is, preferably, based on the number of time slots **36_1-36_n** between the time slot, n, of the last path loss estimate and the first time slot of the communication transmitted by the transmitting station **112.** The value of α is between zero and one. Generally, if the time difference between the time slots is small, the recent path loss estimate will be fairly accurate and α is set at a value close to one. By contrast, if the time difference is large, the path loss estimate may not be accurate and the long term average path loss measurement is most likely a better estimate for the path loss. Accordingly, α is set at a value closer to one.

[0033] **Equations 3** and **4** are equations for determining α.

$$\alpha = 1 - (D - 1)/(D_{max} - 1) \qquad \text{Equation 3}$$

$$\alpha = \max\{1-(D-1)/(D_{max\text{-}allowed} - 1), 0\} \qquad \text{Equation 4}$$

The value, D, is the number of time slots **36_1-36_n** between the time slot of the last path loss estimate and the first time slot of the transmitted communication which will be referred to as the time slot delay. If the delay is one time slot, α is one. D_{max} is the maximum possible delay. A typical value for a frame having fifteen time slots is seven. If the delay is D_{max}, α is zero $D_{max\text{-}allowed}$ is the maximum allowed time slot delay for using open loop power control. If the delay exceeds $D_{max\text{-}allowed}$, open loop power control is effectively turned off by setting $\alpha = 0$. Using the transmit power level, P_{TS}, determined by a transmit power calculation device **98** the transmit power of the transmitted communication is set.

[0034] **Figures 5** and **6** compare the performance of the weighted outer loop/open loop, open loop and closed loop systems. The simulations in **Figures 5** and **6** were performed for a slightly different version of the outer loop/weighted open loop algorithm. In this version, the target SIR is updated every block. A SIR_{TARGET} is increased if a block error was detected and decreased if no block error was detected. The outer loop/weighted open loop system used **Equation 2. Equation 3** was used to calculate α. The simulations compared the performance of the systems controlling a UE's **32_1** transmission power level. For the simulations, 16 CRC bits were padded every block. In the simulation, each block was 4 frames. A block error was declared when at least two raw bit errors occur over a block. The uplink communication channel is assigned one time slot per frame. The target for the block error rate is 10%. The SIR_{TARGET} is updated every 4 frames. The simulations address the performance of these systems for a UE **32_1** traveling at 30 kilometers per hour. The simulated base station used two antenna diversity for reception with each antenna having a three finger RAKE receiver. The simulation approximated a realistic channel and SIR estimation based on a midamble sequence of burst type 1 field in the presence of additive white Gaussian noise (AWGN). The simulation used an International Telecommunication Union (ITU) Pedestrian B type channel and QPSK modulation. Interference levels were assumed to have no uncertainty. Channel coding schemes were not considered. L_0 was set at 0 db.

[0035] Graph **120** of **Figure 5** shows the performance as expected in terms of the required E_S/N_O for a BLER of 10^{-1} as a function of time delay between the uplink time slot and the most recent downlink time slot. The delay is expressed by the number of time slots. E_s is the energy of the complex symbol. **Figure 5** demonstrates that, when gain/interference uncertainties are ignored, the performance of the combined system is almost identical to that of weighted open loop system. The combined system outperforms the closed loop system for all delays.

[0036] In the presence of gain and interference uncertainties, the transmitted power level of the open loop system is either too high or too low of the nominal value. In graph **122** of **Figure 6,** a gain uncertainty of -2 dB was used. **Figure 6** shows the BLER as a function of the delay. The initial reference SIR_{TARGET} for each system was set to its corresponding nominal value obtained from **Figure 5,** in order to achieve a BLER of 10^{-1}. **Figure 6** shows that, in the presence of gain uncertainty, both the combined and closed loop systems achieve the desired BLER. The performance of the weighted open loop system severely degrades.

Claims

1. A spread spectrum time division duplex user equipment communicating using frames with time slots for communication, comprising:

means (82, 88, 92) for receiving, in a first time slot, a first communication having a transmit power level and measuring a power level of said communication;
means (94) for determining a path loss estimate based in part on said measured power level and said received power level; the user equipment

characterized by:

means (96, 98 106) for setting a transmission power level for transmission of a second communication in a second time slot based in part on the path loss estimate weighted by a first factor and a long term path loss estimate weighted by a second factor, said first and second factors being a function of a time separation of the first and second time slots; and
means (108, 82) for transmitting the second communication in the second time slot at the set transmission power level.

2. The user equipment of claim 1 further **characterized by** comprising:

means (98) for determining the long term path loss estimate based at least in part upon an average of path loss estimates of communications received by the user equipment.

3. The user equipment of claim 2 further **characterized by** comprising:

means (96) for determining a quality, α, of the path loss estimate which is based in part on a number of slots, D, between the first and second time slot; and

wherein the first factor is $\alpha$and teh second factor is 1-α.

4. The user equipment of claim 3 further **characterized by** a maximum time slot delay is D_{max} and $\alpha$is determined by:

$$\alpha = 1 - (D - 1)/(D_{max} - 1).$$

5. The user equipment of claim 3 further **characterized by** maximum allowed time slot delay is $D_{max\text{-}allowed}$and the determined quality, α, is determined by:

$$\alpha = \max\{1-(D-1)/(D_{max\text{-}allowed}-1), 0\}.$$

6. A spread spectrum time division duplex user equipment using frames with time slots for communication, comprising:

an antenna (82) for receiving a first communication in a first time slot and transmitting an amplified second communication in a second time slot;
a channel estimation device (88) having an input receiving said first communication for producing channel information;
a data estimation device (90) responsive to said first communication and said channel information for producing interpreted data;
a power measurement device (92) responsive to said channel information for determining a received power level of the first communication;
a path loss estimation device (94) responsive to said measured power level for producing a path loss estimate of the first communication; the user equipment

characterized by comprising:

a quality measurement device (96) for producing a quality measurement based at least in part upon a time separation of the first time slot and a second time slot;
a transmit power calculation device (98) responsive to said path loss estimate and said quality measurement for producing a power control signal based at least in part upon said path loss estimate weighted by a first factor and a long term path loss estimate weighted by a second factor, wherein the first and second factors are based in part on the quality measurement; and
an amplifier (106) receiving the power control signal and a second communication to be transmitted in the second time slot for amplifying the second communication responsive to the power control signal to produce the amplified second communication for transmission by the antenna.

7. The user equipment of claim 6 further comprising:

a data generator (102) for producing communication data;
a spreading and training sequence insertion device (104) having an input receiving the communication data for producing the second communication in the second time slot; and
a modulator (108) having an input receiving the amplified second communication for modulating the amplified second communication to radio frequency prior to transmission.

8. The user equipment of claim 6 further comprising:

a demodulator (86) having an input receiving the received first communication for producing a baseband signal; and

wherein the channel estimation device (88) and the data estimation device (90) each have an input receiving the baseband signal.

9. The user equipment of claim 6 further **characterized by** the quality measurement is in the range of zero to one and the first factor is the quality measurement and the second factor is one minus the quality measurement.

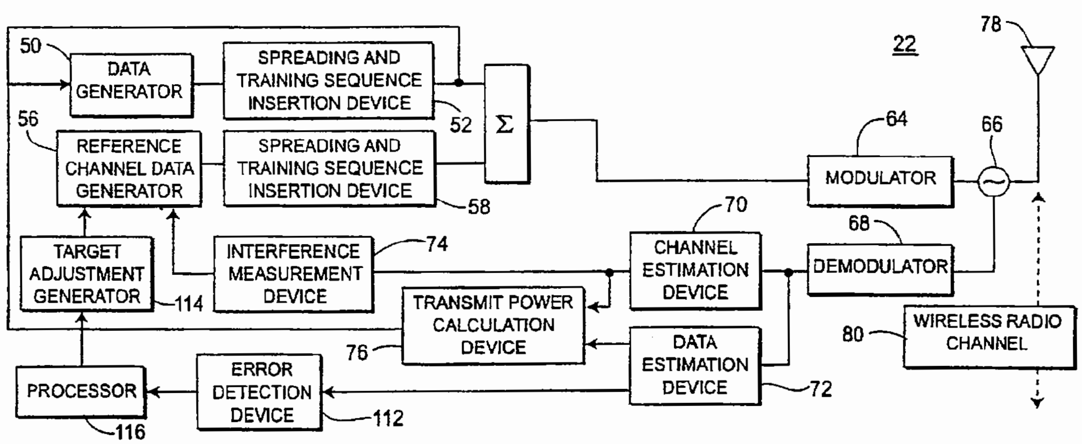
(54) **Title:** DOWNLINK POWER CONTROL FOR MULTIPLE DOWNLINK TIME SLOTS IN TDD COMMUNICATION SYSTEMS



(57) **Abstract:** The present invention is a method and system for controlling downlink transmission power levels in a spread spectrum time division communications system having frames with time slots for communication, which receives at a user equipment (UE) a downlink communication from a base station and determines an error rate of the received communication. The UE then produces power level adjustments for each of the time slots based in part on the error rate and transmits an uplink communication to the base station which includes the power level. In response to the power level adjustments and(or) other information, transmission power level is set for each time slot in the downlink communication.

WO 01/84740 A2

[0001] DOWNLINK POWER CONTROL FOR MULTIPLE DOWNLINK TIME SLOTS IN TDD COMMUNICATION SYSTEMS

[0002] BACKGROUND

[0003] This invention generally relates to spread spectrum time division duplex (TDD) communication systems. More particularly, the present invention relates to a system and method for controlling downlink transmission power within TDD communication systems.

[0004] Spread spectrum TDD systems carry multiple communications over the same spectrum. The multiple signals are distinguished by their respective chip code sequences (codes). Referring to Figure 1, TDD systems use repeating frames 34 divided into a number of time slots 37_1-37_n, such as fifteen time slots. In such systems, a communication is sent in a selected time slot out of the plurality of time slots 37_1-37_n using selected codes. Accordingly, one frame 34 is capable of carrying multiple communications distinguished by both time slot and code. The combination of a single code in a single time slot is referred to as a physical channel. Based on the bandwidth required to support a communication, one or multiple physical channels are assigned to that communication.

[0005] Most TDD systems adaptively control transmission power levels. In a TDD system, many communications may share the same time slot and spectrum. While user equipment (UE) 22 is receiving a downlink transmission from a base station, all the other communications using the same time slot and spectrum cause interference to the specific communication. Increasing the transmission power level of one communication degrades the signal quality of all other communications within that time slot and spectrum. However, reducing the transmission power level too far results in undesirable signal to noise ratios (SNRs) and bit error rates (BERs) at the receivers. To maintain both the signal quality of communications and low transmission power levels, transmission power control is used.

[0006] The standard approach to TDD downlink power control is a combination of inner and outer loop control. In this standard solution, the UE transmits physical layer transmit power control (TPC) commands to adjust the base station transmission power. A base station sends a transmission to a particular UE. Upon receipt, the UE measures the signal interference ratio (SIR) in all time slots and compares this measured value to a SIR_{TARGET}. This SIR_{TARGET} is generated from the Block Error Rate (BLER) signaled from the base station.

[0007] As a result of the comparison of the measured SIR value with the SIR_{TARGET}, the UE transmits a TPC command to the base station. The standard approach provides for a TPC command per coded composite transport channel (CCTrCH). The CCTrCH is a physical channel which comprises the combined units of data for transmission over the radio interface to and from the UE or base station. This TPC command indicates to the base station to adjust the transmission power level of the downlink communication. The base station, which is set at an initial transmission power level, receives the TPC command and adjusts the transmit power level in all time slots associated with the CCTrCH in unison.

[0008] This approach to TDD downlink power control works well as long as the interference in each time slot is the same. Unfortunately, in most cases, the interference in each time slot is different. A small difference may be acceptable due to the averaging effect of the interleaving, but larger differences cause degradation due to thresholding effects in the receiver. This requires the receiver to have a wider dynamic range and unnecessarily high transmit power in some time slots. An adjustment made to the base station SIR_{TARGET} for all time slots based on the error value may create an unbalanced increase or decrease of the power level. In other words, those time slots where the power level was lower than the initial value of the base station will be adjusted even lower when the calculated error value was higher than the SIR_{TARGET}. These low level power time slots may then be eliminated from detection, thereby the transmission will be degraded. The same is true for those time slots in which the power level was higher than the SIR_{TARGET} of the base station. When the detected error rate is lower than the SIR_{TARGET}, the higher power level time slots will be increased, thereby creating interference with other channels on the system.

[0009] Accordingly, there is a need to have an approach to TDD downlink power control which adjusts the power level of each slot individually.

[0010] SUMMARY

[0011] The present invention is a method and system for controlling downlink transmission power levels in a spread spectrum time division communication system having frames with time slots for communication, which receives at a user equipment

(UE) a downlink communication from a base station and determines an error rate of the received communication. The UE then produces power level adjustments for each of the time slots based in part on the error rate and transmits an uplink communication to the base station which includes the power level adjustment for each of the time slots. In response to the power level adjustments transmission power level is set for each time slot in the downlink communication.

[0012] BRIEF DESCRIPTION OF THE DRAWING(S)

[0013] Figure 1 illustrates time slots in repeating frames of a TDD system.

[0014] Figure 2 illustrates a simplified wireless TDD system.

[0015] Figures 3A and 3B illustrate block diagrams of a UE and base station, respectively.

[0016] Figure 4 illustrates a flow diagram of a first embodiment.

[0017] Figure 5 illustrates a flow diagram of a second embodiment.

[0018] Figure 6 illustrates a block diagram of the base station made in accordance with the second embodiment.

[0019] Figure 7 illustrates a flow diagram of a third embodiment.

[0020] Figure 8 illustrates a flow diagram of a fourth embodiment.

[0021] Figure 9 illustrates a flow diagram of a fifth embodiment.

[0022] Figure 10 illustrates a flow diagram of a sixth embodiment.

[0023] Figure 11 illustrates a flow diagram of a seventh embodiment.

[0024] DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT(S)

[0025] The preferred embodiments will be described with reference to the drawing figures where like numerals represent like elements throughout.

[0026] Figure 2 illustrates a simplified wireless spread spectrum code division multiple access (CDMA) or time division duplex (TDD) communication system 18. The system 18 comprises a plurality of node Bs 26, 32, 34, a plurality of radio network controllers (RNC), 36, 38, 40, a plurality of UEs 20, 22, 24 and a core network 46. The plurality of node Bs 26, 32, 34 are connected to a plurality RNCs 36, 38, 40, which are, in turn, connected to the core network 46. Each Node B, such as Node B 26, communicates with its associated user equipment 20-24 (UE). The Node B 26 has a single site controller (SC) associated with either a single base station 30_1, or multiple base stations $30_1 \ldots 30_n$.

[0027] Although the present invention is intended to work with one or more UEs, Node Bs and RNCs, for simplicity of explanation, reference will be made hereinafter to the operation of a single UE in conjunction with its associated Node B and RNC.

[0028] Referring to Figure 3A, the UE 22 comprises an antenna 78, an isolator or switch 66, a modulator 64, a demodulator 68, a channel estimation device 70, data estimation device 72, a transmit power calculation device 76, an interference measurement device 74, an error detection device 112, a processor 111, a target adjustment generator 114, a reference channel data generator 56, a data generator 50, and two spreading and training sequence insertion devices 52, 58.

[0029] The UE 22 receives various radio frequency (RF) signals including communications from the base station 30_1 over the wireless radio channel using an antenna 78, or alternatively an antenna array. The received signals are passed through a T/R switch 66 to a demodulator 68 to produce a baseband signal. The baseband signal is processed, such as by a channel estimation device 70 and a data estimation device 72, in the time slots and with the appropriate codes assigned to the UEs 22 communication. The channel estimation device 70 commonly uses the training sequence component in the baseband signal to provide channel information, such as channel impulse responses. The channel information is used by the data estimation device 72, the interference measurement device 74 and the transmit power calculation device 76. The data estimation device 72 recovers data from the channel by estimating soft symbols using the channel information.

[0030] Prior to transmission of the communication from the base station 30_1, the data signal of the communication is error encoded using an error detection/correction encoder 112. The error encoding scheme is typically a cyclic redundancy code (CRC) followed by a forward error correction encoding, although other types of error encoding schemes may be used. As those skilled in the art know, the data is typically interleaved over all of the time slots and all codes.

[0031] Using the soft symbols produced by the data estimation device 72, the error detection device 112 detects errors in the frame. Each time a frame is determined to have an error, a counter is incremented. This counter value becomes the block error rate (BLER). A processor 111 in the UE 22 typically determines a target signal to interference ratio SIR value based on the measured BLER and determines a signal to interference ratio SIR_{UE} for all time slots. Based on the SIR_{UE}, the processor 111 determines the adjustment of the base station transmit power by comparing the SIR_{UE} with the SIR_{TARGET}. Based on this comparison, a TPC command is generated by the target adjustment generator 114 for each time slot. Each TPC command is subsequently sent to the base station.

[0032] In a first embodiment of the present invention, the target adjustment generator 114 in the UE 22 generates and transmits TPC commands in each time slot of the CCTrCH. The TPC command in each time slot indicates to the base station 30_1 to adjust the downlink transmission power level for each time slot. The uplink physical channel comprises these TPC commands for each slot associated with the CCTrCH, and is communicated to the base station for processing. These TPC commands may be transmitted in a single uplink physical channel, or spread over several uplink physical channels.

[0033] Referring to Figure 3B, a base station made in accordance with the first embodiment of the present invention is illustrated. The antenna 82 or, alternately, antenna array of the base station 30_1 receives various RF signals including the TPC commands. The received signals are passed via a switch 84 to a demodulator 86 to produce a baseband signal. Alternatively separate antennas may be used for transmit or receive functions. The baseband signal is processed, such as by a channel estimation device 88 and a data estimation device 90, in the time slots and with the appropriate codes assigned to the communication burst of the UE 22. The channel estimation device 88 commonly uses the training sequence component in the baseband signal to provide channel information, such as channel impulse responses. The channel information is used by the data estimation device 90. The data information is provided to the transmit power calculation device 98 by processor 103.

[0034] Processor 103 converts the soft symbols produced by the data estimation device 90 to bits and extracts the TPC commands for each time slot associated with the CCTrCH. The transmit power calculation device 98 combines the TPC commands with the SIR_{target} to determine the transmission power for each time slot associated with the CCTrCH.

[0035] Data to be transmitted from the base station 30_1 is produced by data generator 102. The data is error detection/correction encoded by error detection/correction encoder 110. The error encoded data is spread and time-multiplexed with a training sequence by the training sequence insertion device 104 in the appropriate time slot(s) and code(s) of the assigned physical channels, producing a communication burst(s). The spread signal is amplified by an amplifier 106 and modulated by modulator 108 to radio frequency. The gain of the amplifier is controlled by the transmit power calculation device 98 to achieve the determined transmission power level for each time slot. The power controlled communication burst(s) is passed through the isolator 84 and radiated by the antenna 82.

[0036] A flow diagram illustrating the method of downlink power control in accordance with the first embodiment of the present invention is shown in Figure 4. The UE 22 receives a downlink signal from the base station 30_1, (step 401), which is then processed by the UE 22 (step 402). The UE 22 then determines the SIR for each time slot of the CCTrCH and compares it to the SIR_{target} (step 403). The UE then generates a TPC command for each time slot (step 404). The TPC commands are transmitted to the base station 30_1 associated with the UE 22, (step 405), which adjusts the transmission power per time slot of the CCTrCH (step 406).

[0037] The use of TPC commands for every time slot provides the communication system with a simple method of equalizing the signal to interference ratio (SIR) in all downlink slots. Since the interference level in different time slots is generally different, this method of the first embodiment of the present invention accounts for this difference and generates a separate TPC command for each time slot to adjust the power level of each time slot in the downlink signal.

[0038] A second embodiment of the present invention presents an alternative approach for balancing the adjustment to the power level individually in each time slot, during downlink transmission by utilizing the time slot interference data from each time slot, a measured downlink interference signal code power (ISCP). This ISCP measurement is made by the UE 22 from time to time, determined by interference rate of change and the amount of interference difference that can be tolerated by the UE 22 without degradation.

[0039] This second embodiment utilizes the time slot interference data from each time slot to equalize the SIR in different slots to counter the fact that the interference is different in each slot. As will be explained in greater detail hereinafter, a TPC command per CCTrCH along with interference information for each slot are used to adjust the transmission power. The difference between the interference in different time slots modifies the values that are obtained from the TPC commands. Therefore, although the interference in each time slot may be different, use of the ISCP information maintains approximately the same SIR in all time slots.

[0040] The UE 22, at each frame, sends a TPC command that corresponds to the average SIR in all time slots that belong to the same CCTrCH. The base station 30_1, then constructs an average transmit power per CCTrCH based on the received TPC commands. As will be explained in greater detail hereinafter, the base station 30_1, then modifies the average power to obtain the transmit power for each time slot for the CCTrCH, based on the relevant interference data and the time slot mapping used. It should be noted that this alternate approach allows the use of multiple spreading factors.

[0041] Referring to Figure 6, a base station made in accordance with this second embodiment is illustrated. The transmit power calculation device 698 within the base station 30_1 initializes the downlink power control approach of the second embodiment by combining the interference and spreading code information to estimate equivalent power obtained from the TPC commands P.

$$P \overline{=} (F/N) \sum_j I_j \sum_k 1/S_{jk} \qquad \text{Equation 1}$$

where j and k refer to time slot and physical channel respectively; N is the total number of physical channels at spreading factor of 16 in one slot. I_j represents the interference in time slot j, j = 1,...N; F is a scaling factor and $1/S_{jk}$ is the spreading factor.

[0042] The transmit power calculation device 698 then, using the interference per time slot and the mapping information stored in the base station data base 696, calculates the scaling factor F in accordance with the following equation:

$$F = NP/(\sum_j I_j \sum_k 1/S_{jk}) \qquad \text{Equation 2}$$

and the transmit power for all physical channels P_{jk} according to Equation 3:

$$P_{jk} = FI_j/1/S_{jk} \qquad \text{Equation 3}$$

The power per time slot is defined as:

$$P_j = FI_j \sum_k 1/S_k \qquad \text{Equation 4}$$

During steady state operation, the transmit power calculation device 698 updates the scaling factor F for each physical channel whenever new downlink interference signal code power (ISCP) measurements I for each time slot associated with the particular downlink CCTrCH are available. In order for the transmit power calculation device 698 to calculate the scaling factor F, the spreading factor for each physical channel is used. The transmit power calculation device 698 calculates the transmit power using the ISCP measurement I which is made available to the transmit power calculation device 698 either periodically or whenever new interference information warrants an update.

[0043] When a new ISCP measurement I is made, the measurement is transferred to the base station 30_1 for calculation of the transmit power for each physical channel. If a new ISCP measurement I is not available, the TPC command from the UE 22 is used to modify

P in the standard way, and the transmit power for all physical channels P_{jk} is calculated therefrom.

[0044] Referring to Figure 5, a flow diagram of downlink power control in accordance with this second embodiment is illustrated. The UE 22 receives a downlink communication from the base station 30_1 (step 501). If the UE 22 determines an updated ISCP measurement is required, the UE 22 makes an ISCP measurement for each time slot in the downlink communication and forwards the new ISCP measurements to the base station 30_1 (step 502). Otherwise the UE 22 generates a TPC command and forwards it to the base station (step 503). The base station 30_1 calculates the scaling factor for all physical channels (step 504) using the TPC command or ISCP measurement from the UE 22. The transmission power level for each time slot is then calculated by the base station 30_1 (step 505) and the downlink signal updated accordingly (step 506).

[0045] It should be noted that even though the second embodiment has been described with the base station storing all required information and conducting all calculations on its own, the Node B 26 and RNC 36 may perform this function instead. Referring to Figure 6, a flow diagram illustrates a third embodiment downlink power control system wherein the Node B 26 and RNC 36 are involved. The UE 22 receives a downlink communication from the base station 30_1 (step 701). If the UE 22 determines an updated ISCP measurement is required, the UE 22 makes an ISCP measurement for each time slot in the downlink communication and forwards the new ISCP measurements to the RNC 36 (step 702). Otherwise the UE 22 generates a TPC command and forwards it to the base station RNC 36 (step 703). If the downlink power control system is set up to have the RNC 36 calculate the transmit power, the transmit power for each time slot is calculated by the RNC 36 (step 704) and then forwarded to the Node B 26 in order to update the base station 30_1 downlink signal (step 706). If the Node B 26 is setup to calculate the transmit power, the RNC 36 transmits the ISCP or TPC connected to the Node B 26 (step 705) where the transmit power for each time slot is calculated (step 706).

[0046] A fourth embodiment for downlink power level control utilizes time slot interference data similar to that disclosed in the second embodiment above. In this approach though, time slot interference is calculated from knowledge of the allocated downlink physical channels by the base station 30_1, and loading information and path loss from all neighbor base stations to the UE 22, rather than requiring explicit ISCP measurements from the UE 22. Each base station, such as base station 30_1, knows all allocated channel configurations for the UE's 22 specific base station 30_1, as well as other neighbor base stations $30_2 \ldots 30_n$. Obviously, if there is only one base station 30_1, no additional information from other base stations is required. The base station 30_1 must also know the load and path loss information of all neighboring base stations from the neighboring base stations to the UE 22.

[0047] When there are multiple base stations, the UE 22 typically measures the primary common control physical channel (PCCPCH) power of base stations under the control of its base station's Node B 26 and all other base stations. The base station 30_1 uses the known PCCPCH transmission power and the power measurement of same as received by the UE to estimate the path loss between the UE and each of the neighbor base stations.

[0048] Referring again to Figure 6, the base station database 696 has stored therein the loading information which specifies the physical channels in the neighbor base station by time slot. This loading information is combined with the PCCPCH. The received signal code power (RSCP) for the particular base station is used to estimate the interference effect of the neighboring base station. From these calculations, the interference at the UE 22 can be calculated. For a non-multiple user detection (MUD) UE, the interference of its associated base station and the interference of the neighboring base stations are used to calculate this value. For a MUD UE, interference generated by the UE's associated base station is excluded from the UE interference value.

[0049] The estimated interference, I(n), using known loading information is calculated by the transmit power calculation device 698 as:

$$I(n) = \sum P_j(n)\, L_j(n) \qquad \text{Equation 5}$$

Applying this estimated interference value to Equations 1 through 4, the transmit power calculation device 698 calculates the transmit power for each time slot.

[0050] Referring to Figure 8, a flow diagram of downlink power control in accordance with this fourth embodiment is illustrated. The base station 30_1 calculates the estimated interference I for each time slot (step 801) and then calculates the transmission power level for each time slot (step 802) using Equations 1 thru 5 above, which updates the base station downlink signal is updated (step 803).

[0051] Again it should be noted that the node B 26 and RNC 36 may also conduct the function of storing all required information and calculating the estimated interference and the transmit power for each time slot. Referring to Figure 9, a flow diagram of downlink power control in accordance with this fifth embodiment is illustrated. The RNC 16 calculates an estimated interference I for each time slot (step 901). If the system is configured such that the node B 26 calculates the transmit power, the RNC 36 forwards the estimated interference I to the node B 26 (step 902) where the transmit power for all physical channels is calculated (step 903), and the base station downlink signal updated (step 904). Otherwise the RNC 36 calculates the transmission power for each the slot (step 903).

[0052] Since physical channels are allocated by the RNC in advance of actual physical transmission, it is possible for a Node B to calculate the expected UE interference for the frame being transmitted in real time. The real time interference calculation allows for the correct transmission power for each time slot for the frame being transmitted.

[0053] A sixth embodiment of the present invention utilizes the combination of the measured and estimated interference approaches disclosed above to control downlink power. In this approach, the base station 30_1 combines weighted interference values for both the estimated interference and measured interference to calculate the transmission power per time slot of the CCTrCH. For MUD UE, the relevant interference (that affects detection performance) in each slot is denoted as:

$$I_D(n) = \sum_{\text{all } j \neq 0} P_j(n) L_j(n) \qquad \text{Equation 5}$$

where $P_j(n)$ is the transmission power of base station j at time n in a certain slot, P_0, being the transmission power of the UE's base station 30_1. $L_j(n)$ denoting the corresponding path loss. For a non-MUD UE, the relevant interference is denoted as:

$$I_D(n) = \sum_{\text{all } j} P_j(n) L_j(n) \qquad \text{Equation 6}$$

The measured interference $I_D(n)$, though, will be reported by the UE as an ISCP measurement. Equations 5 and 6 are merely illustrative of this interference present in the communication system:

[0054] The estimated interference is denoted as:

$$I(n) = \sum P_j(n)\, L_j(n) \qquad \text{Equation 7}$$

Where the summation is carried over all known interferers whose load and path loss to the UE are known. Similar to the fifth embodiment, load information is known by the base station 30_1 for all j. Any interference from a load UE not known is designated as the residual interference $I_j(n)$, $I_f(n) = I(n) - I_D(n)$. From each of these interference values, the transmission power device 698 combines them to generate a more accurate interference power value to be used in the estimation of the downlink transmission power for each time slot, defined by Equations 1 thru 4. The combined interference power value is defined as:

$$I = \alpha\, I_f + \beta\, I + \gamma\, I_D,\ \alpha + \beta + \gamma = 1 \qquad \text{Equation 8}$$

where coefficients α, β and γ are determined per system or even per slot according to measurement delays or existence of foreign base stations.

[0055] Illustrated in Figure 10 is a flow diagram of the downlink power control system in accordance with the sixth embodiment. The base station 30_1 receives a communication from the UE_{22} including an ISCP interference measurement I_D for each time slot (step 1001). The transmission power calculation device 698 then calculates an estimated interference value I using information stored in the base station database 698 (step 1002). A residual interference value I_F is then calculated by the transmission power calculation (step 1003). The transmission power calculation device then combines the three interference values I_D, I, I_F (step 1004) and calculates the transmission power for each time slot of the downlink communication (step 1005).

[0056] Similar to the previous embodiments, the RNC 36 and Node B 26 may calculate the transmission power for each time slot as described above in a seventh embodiment. Referring to Figure 11, a flow diagram of this embodiment is illustrated. The RNC 36 receives a communication from the UE 22 including an ISCP interference measurement I_D for each time slot. (step 1101) The RNC 36 then calculates an estimated interference value $\hat{I}$ using information stored in the RNC 36 (step 1102) and a residual interference value I_F (step 1103). The RNC 36 then combines the three interference values I_D, $\hat{I}$, I_F (step 1104) and calculates the transmission power for each time slot of the downlink communication using Equations 1 thru 4 (step 1106) and forwards them to the base station 30_1 by way of the node B 26. (step 1107) If the downlink power control system is set up to allow the node B 26 to calculate the transmission power for each time slot, the RNC 36 forwards the combined interference value I to the node B 26 (step 1105), which calculates the transmission power for each time slot (step 1106) and forwards them to the base station (step 1107).

[0057] The benefit of providing a system which utilizes a measured ISCP value and an estimated interference value to calculate the transmission power for each time slot of the downlink communication is two fold : 1) the system provides flexibility to the calculation of transmission power in a case where the required information is not known; and 2) the system provides a more accurate estimate of the interference present in the communication system.

* * *

CLAIMS

What is claimed is:

1. A method for controlling downlink transmission power levels in a spread spectrum time division communication system having frames with time slots for communication, the method comprising:

a) receiving at a user equipment (UE) a downlink communication from a base station and determining an error rate of the received communication,

b) producing power level adjustments for each of said time slots based in part on the error rate,

c) transmitting an uplink communication from the UE to the base station including the power level adjustments for each of said time slots; and

d) setting a transmission power level for each time slot in said downlink communication in response to said power level adjustments.

2. The method of claim 1 further comprising:

f) generating a signal to interference ratio (SIR) based on the error rate determined at step.

3. The method of claim 2 further comprising:

g) comparing the SIR obtained in step f) with a target level, a result of comparison in step g) being used to determine the power level adjustment of step b).

4. A downlink power control system for use in a spread spectrum time division communication system having frames with time slots for communication, comprising:

a user equipment for determining an error rate of a downlink communication and producing power level adjustments in response to said error rate for each of said time slots of said downlink communication; and

a base station for transmitting said downlink communication and setting a transmission power level for each of said time slots in said downlink communication responsive to power level adjustments received from said UE.

5. A method for controlling downlink transmission power levels in a spread spectrum time division duplex communication system having time slots for communication, the method comprising:

a) receiving a downlink communication from a base station and determining an interference power measurement for each of said time slot used by the downlink communication at a UE;

b) transmitting an uplink communication having said interference power measurement for each of said time slots from the UE; and

c) setting a transmission power level at the base station for the UE for each of said time slots in said downlink communication in response to said interference power measurement for each of said time slots.

6. The method of claim 5 further comprising the steps of:

determining an error rate of the downlink communications; and

generating a power level adjustment based in part on the error rate.

7. The method of claim 6 wherein step c includes modifying said power level adjustment using said interference power measurement for each downlink communication time slot.

8. A downlink power control system for use in a spread spectrum time division communication system having time slots for communication comprising:

a user equipment for receiving a downlink communication and transmitting interference power measurement for each downlink communication time slot to a transmitting station; and

said station setting a transmission power level for each downlink communication time slot in response to said interference power measurement for each downlink communication time slot.

9. The downlink power control system of claim 8 wherein said station is a base station.

10. The downlink power control system of claim 8 wherein said station is a node B.

11. The system of claim 9 wherein a radio network controller receives said interference power measurements for each of said slots and forwards them to said base station.

12. The downlink power control system of claim 8 wherein said station is a radio network controller.

13. A method for controlling downlink transmission power levels in a spread spectrum time division duplex communication system having time slots for communication, the method comprising:

a) calculating an estimated interference power measurement for each downlink communication of said time slot; and

b) setting a transmission power level for each downlink communication time slot in response to said estimated interference power level for each downlink communication time slot.

14. A downlink power control system for use in a spread spectrum time division duplex communication system having time slots for communication comprising:

a user equipment for receiving a downlink communication; and

a station for calculating an estimated interference power level for each downlink communication time slot and setting a transmission power level for each downlink communication time in response to said estimated interference power level in each downlink communication time slot.

15. The system of claim 14 wherein said station is a node B.

16. The system of claim 15 wherein said node B further forwards said transmission power level for each of said time slots to a base station.

17. The system of claim 14 wherein said station is a radio network controller (RNC).

18. The system of claim 17 further comprising a node B for receiving said transmission power level for each of said time slots from said RNC and forwarding said transmission power level for each of said time slots to a base station.

19. A method for controlling downlink transmission power levels in a spread spectrum time division duplex communication system having time slots for communication, the method comprising:

receiving a downlink communication and determining an interference power measurement for each downlink communication time slot;

transmitting an uplink communication having said interference power measurement for each downlink communication time slot; and

calculating an estimated interference power measurement for each time slot in a downlink communication; and

setting a transmission power level for each downlink communication time slot in response to said interference power measurement and said estimated interference power for each downlink communication time slot.

20. The method of claim 19 further comprising the steps of:

determining a residual interference power;

generating weights for weighing said residual interference, said interference power measurement and said estimated interference power;

combining residual interference power with said interference power measurement and said estimated interference power according to said weights.

21. A method for controlling downlink transmission power levels in a spread spectrum time division duplex communication system, wherein said communication

system supports multiple concurrent communications over a common bandwidth, having multiple time slots and codes for distinguishing between communications, the method comprising:

a) calculating an estimated interference power measurement for each time slot based upon the power of each of said multiple communications communicated in said time slot; and

b) setting a transmission power level for each downlink communication time slot in response to said estimated interference power level for each downlink communication time slot.

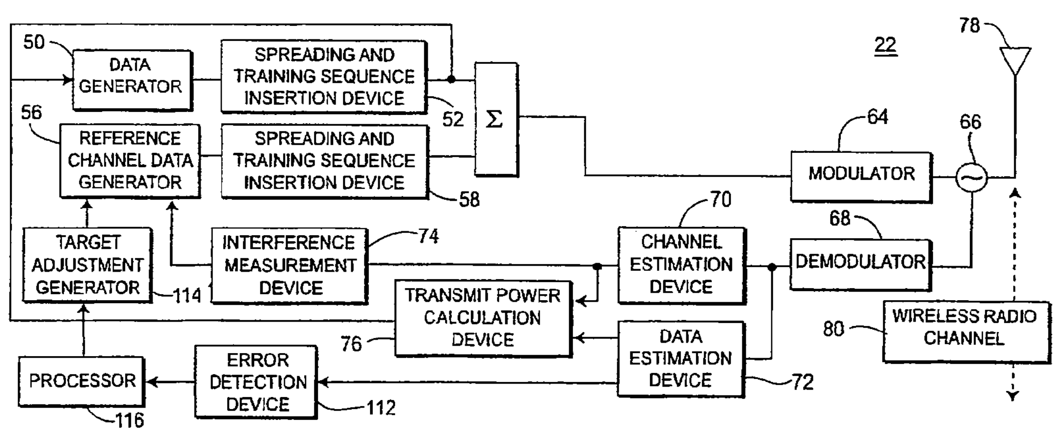
(54) Title: DOWNLINK POWER CONTROL FOR MULTIPLE DOWNLINK TIME SLOTS IN TDD COMMUNICATION SYSTEMS



(57) Abstract: The present invention is a method and system for controlling downlink transmission power levels in a spread spectrum time division communications system having frames with time slots for communication, which receives at a user equipment (UE) a downlink communication from a base station and determines an error rate of the received communication. The UE then produces power level adjustments for each of the time slots based in part on the error rate and transmits an uplink communication to the base station which includes the power level. In response to the power level adjustments and(or) other information, transmission power level is set for each time slot in the downlink communication.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US 01/13720

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

1-12

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

1. Claims: 1-12

Claims 1-4 relate to a method and system for downlink power control in a CDMA/TDD communication system where the user equipment measures an error rate or (claims 5-12) an interference power (SIR) for each time slot of a multi-slot downlink communication and reports the measured values to a BS or RNC.

2. Claims: 13-21

Claims 13-18 and 21 relate to a method and system for downlink power control in a CDMA/TDD communication system where the base station calculates an estimated interference power measurement (SIR) for each time slot of a multi-slot downlink communication, or (claims 19 and 20) sets the transmission power level in response to a combination of this calculated estimation with a reported measurement of an user equipment.

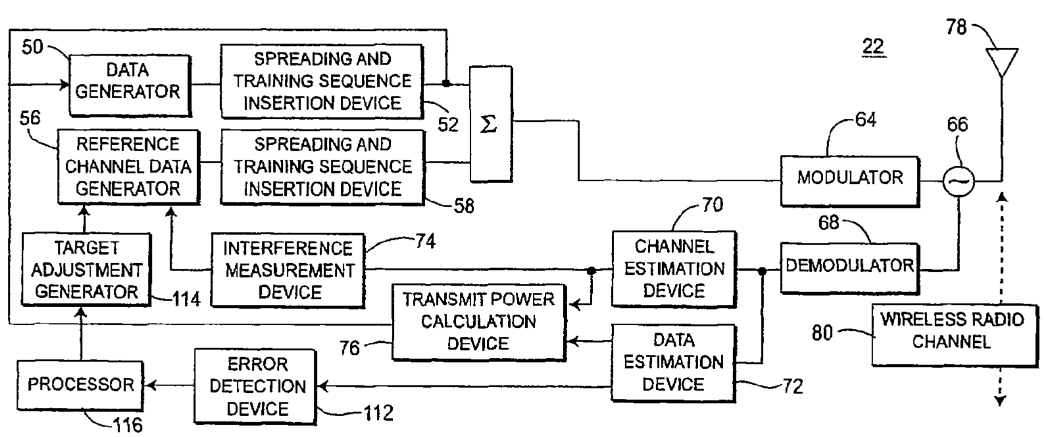
(54) Title: DOWNLINK POWER CONTROL FOR MULTIPLE DOWNLINK TIME SLOTS IN TDD COMMUNICATION SYSTEMS



(57) Abstract: The present invention is a method and system for controlling downlink transmission power levels in a spread spectrum time division communications system having frames with time slots for communication, which receives at a user equipment (UE) a downlink communication from a base station and determines an error rate of the received communication. The UE then produces power level adjustments for each of the time slots based in part on the error rate and transmits an uplink communication to the base station which includes the power level. In response to the power level adjustments and(or) other information, transmission power level is set for each time slot in the downlink communication.

INTERNATIONAL SEARCH REPORT

ıtional application No.
PCT/US 01/13720

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [ ] Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. [ ] Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. [ ] Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. [X] As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

[ ] The additional search fees were accompanied by the applicant's protest.

[X] No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

1. Claims: 1-12

Claims 1-4 relate to a method and system for downlink power control in a CDMA/TDD communication system where the user equipment measures an error rate or (claims 5-12) an interference power (SIR) for each time slot of a multi-slot downlink communication and reports the measured values to a BS or RNC.

2. Claims: 13-21

Claims 13-18 and 21 relate to a method and system for downlink power control in a CDMA/TDD communication system where the base station calculates an estimated interference power measurement (SIR) for each time slot of a multi-slot downlink communication, or (claims 19 and 20) sets the transmission power level in response to a combination of this calculated estimation with a reported measurement of an user equipment.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

SECOND SUPPLEMENTAL INFORMATION DISCLOSURE STATEMENT TRANSMITTAL

Sir:

Pursuant to the duty of disclosure under 37 C.F.R. § 1.56, and in accordance with MPEP § 601 and 37 C.F.R. §§ 1.97 and 1.98, Applicants and the undersigned attorney bring the information listed on Form PTO/SB/08a, filed concurrently herewith, to the attention of the Examiner.

The references cited in this Information Disclosure Statement were cited in A European Search Report (European Application No. 10185576.5-1246) which issued on December 2, 2010, a copy of which is attached.

Pursuant to 37 C.F.R. § 1.97(h), the filing of this Information Disclosure Statement shall not be construed to be an admission that the information cited in the statement is, or is considered to be, material to patentability as defined in 37 C.F.R. § 1.56(b).

The Commissioner is hereby authorized to charge any additional fees which may be required with respect to this communication, or credit any overpayment, to Deposit Account No. 06-1135.

Respectfully submitted,

**BEFORE THE BOARD OF PATENT APPEALS
AND INTERFERENCES**

Application Number: 10/917,968
Filing Date: August 12, 2004
Appellant(s): ANDERSON, NICHOLAS WILLIAM

____
Steven G. Parmelee
For Appellant

EXAMINER'S ANSWER

This is in response to the appeal brief filed 12/17/2010 appealing from the Office action mailed 08/03/2010.

(1) Real Party in Interest

A statement identifying the real party in interest is contained in the brief.

(2) Related Appeals and Interferences

The examiner is not aware of any related appeals, interference, or judicial proceedings which will directly affect or be directly affected by or have a bearing on the Board’s decision in the pending appeal.

(3) Status of Claims

The statement of the status of the claims contained in the brief is correct.

(4) Status of Amendments After Final

The appellant's statement of the status of amendments after final rejection contained in the brief is correct.

(5) Summary of claimed Subject Matter

The summary of claimed subject matter contained in the brief is correct.

(6) Grounds of Rejection to be Reviewed on Appeal

The appellant’s statement of the grounds of rejection to be reviewed on appeal is correct.

(7) Claims Appendix

The copy of the appealed claims contained in the Appendix to the brief is correct.

(8) Evidence Relied Upon

WO 00/57574	Zeira et al.	03-2000
US 2005/0025056 A1	Chen et al.	05-2004
US 2001/0036823 A1	Van Lieshout et al.	05-2001
US 6,983,166 B2	Shiu et al.	08-2001
US 2005/0176455 A1	Krishnan et al.	02-2004

(9) Grounds of Rejection

The following ground(s) of rejection are applicable to the appealed claims:

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

2. Claims 1-4,7,15,26,28,32,33,43,46,49 and 50 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO

00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) and further in view of Van Lieshout et al. (US Pub. No. 2001/0036823).

Regarding claim 1, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising, at a remote transceiver:

determining a path loss of a radio channel between a base station and the remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);

receiving a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

calculating, at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claims 2 and 32, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claims 1 and 26. In addition, Zeira teaches the method of power control, the method further comprising transmitting an uplink signal at a calculated transmit power level (Page 5, lines 4-8).

Regarding claims 3 and 28, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claims 1 and 26. In addition, Zeira teaches the method of power control, wherein determining the path loss includes: receiving a downlink signal transmitted from the base station, wherein the downlink signal signals a transmitted power level of the downlink signal; and measuring a received power level of the downlink signal (Page 2, lines 14-21; Page 4, lines 17-page 8).

Regarding claim 4, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the method of power control, wherein determining the path loss further includes computing a difference between the signaled transmit power level and the measured received power level (Page 2, lines 1-lines 21; Page 5, lines 2-lines 4).

Regarding claims 7 and 33, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the method of power control, wherein the calculated the transmit power level is based on a spreading factor parameter (Page 13, lines 2-15).

Regarding claim 15, the combination of Zeira, Chen, and Van Lieshout teach all the claimed elements in claim 1. In addition, Zeira teaches the power control method, further comprising calculating a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based on the path loss and an accumulated TPC command (Page 4, line 17-Page 5, line 8).

Regarding claim 26, Zeira teaches a remote transceiver for a cellular communication system, the remote transceiver having a computer program for controlling power in a radio communication system, the computer program comprising instructions for:

determining a path loss for a radio channel between a base station and the remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8);
and

receiving a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

calculating a transmit power level for the remote transceiver based on the path loss and an accumulated TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 43, Zeira teaches a method of power control in a radio communications system (See Abstract), the method comprising, at a base station:

sending transmit power control (TPC) commands (Page 4, line 17-Page 5, line 8); and

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except on a shared physical channel used to carry allocation and scheduling information from the base station to a remote transceiver, sending an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the* *virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 46, Zeira teaches a base station for a cellular communication system, the base station having a computer program stored therein and further for controlling power in a radio communication system (See Abstract), the computer program comprising instructions for:

sending a transmit power control (TPC) command (Page 4, line 17-Page 5, line 8);

receiving an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level)*, but fails to teach on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station to the remote transceiver, sending an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is* *configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).*
Therefore, it would have been obvious to one of ordinary skill in the art at the time of the

invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 49, Zeira teaches a remote transceiver for supporting power control in a radio communication system, the remote transceiver comprising:

a signal processor for determining a path loss for a radio channel between a base station and the remote transceiver (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8); and

a receiver arranged to receive transmit power control (TPC) command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level*;

wherein the signal processor is arranged to calculate a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level* *in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level),* except on a shared physical channel used to carry allocation and scheduling information from the base station and an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information from the base station and an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

Regarding claim 50, Zeira teaches a base station for supporting power control in a radio communication system, the base station comprising:

a transmitter arranged to transmit to a remote transceiver and transmit power control (TPC) command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A* *power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level)*; and

a receiver arranged to receive an uplink signal from the remote transceiver at a calculated transmit power level based on a path loss and the TPC command (Page 2, lines 14- 21; Page 4, line 17-Page 5, line 8), except for on a shared physical channel used to carry allocation and scheduling information and an allocation of a scheduled uplink transmission resource.

However, in related art, Chen teaches on a downlink dedicated control channel (DCCH) channel used to carry allocation and scheduling information and an allocation of a scheduled uplink transmission resource *(Paragraphs 0012,0052-0057, especially, paragraph 0012, Chen teaches it is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method. Paragraph 0054, Chen teaches the transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH). Paragraph 0052, Chen teaches the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30).*Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Chen to Zeira in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method (Chen, paragraph 0012).

Chen, further, teaches downlink dedicated control channel (DCCH) used to carry allocation and scheduling information (Paragraphs 0012,0052, and 0054, see above), but does not specifically teach on a shared physical channel used to carry allocation and scheduling information.

However, Van Lieshout teaches on a shared physical channel (shared radio channel) used to carry allocation and scheduling information (*Para. 0006, Van Lieshout teaches since the DRNC is in charge of scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the shared radio channel).* Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of van Lieshout to Zeira and Chen so that the mobile unit can find out the available resources that it can use from the base station.

3. Claims 8 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) in view of Van Lieshout et al. (US Pub. No. 2001/0036823) and further in view of Shiu et al. (US Patent #6,983,166).

Regarding claims 8 and 34, the combination of Zeira, Chen, and Van Lieshout fails to teach the method of power control, wherein the calculated transmit power level is based on parameter associated with a selected transport format.

However, in related art, Shiu teaches the method of power control, wherein the calculated transmit power level is based on parameter associated with a selected transport format. (Col 3, lines 27-41).Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Shiu to Zeira, Chen, and Van Lieshout in order to adjust transmit power and achieve target block error rate (BLERs) (See Shiu, Col 3, line 31).

4. Claims 16,17,30,31,44,45,47, and 48 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zeira et al. (International Publication Number #WO 00/57574) in view of Chen et al. (US Pub. No. 2005/0025056) in view of Van Lieshout et al. (US Pub. No. 2001/0036823) and further in view of Krishnan et al. (US Pub. No. 2005/0176455).

Regarding claims 16,30,44, and 47, the combination of Zeira, Chen, and Van Lieshout fail to teach the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only.

However, in related art, Krishnan teaches the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to utilize only the accumulated TPC commands when deriving the calculated transmit power level, thereby disabling use of open loop power control and enabling use of closed loop power control only (Paragraphs 0047-0050, especially, Paragraphs 0049-0050). Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Krishnan to Zeira, Chen, and Van Lieshout in order to provide the transmitting terminal feedback regarding the power of signals received at the receiving terminal.

Regarding claim 17,31,45, and 48, the combination of Zeira, Chen, and Van Lieshout fail to teach the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control.

However, in related art, Krishnan teaches the power control method, further comprising receiving a signal from the base station for instructing the remote transmitter to disregard the accumulated TPC command when deriving the calculated transmit power level, thereby enabling use of open loop power control only and disabling use of closed loop power control (Paragraphs 0047-0050, especially, Paragraphs 0049-0050).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to provide the above teaching of Krishnan to Zeira, Chen, and Van

Lieshout in order to provide the transmitting terminal feedback regarding the power of signals received at the receiving terminal.

(10) Response to Argument

5. Appellant's arguments, see pages 10-12, filed 12/03/2010, with respect to the rejection(s) of claim(s) 26,28,30-34 and 46-48 under 35 U.S.C. 101 and 112 have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, Appellant's arguments with respect to claims 1-4,7,8,15-17,26,28,30-34, and 43-50 under 35 U.S.C. 103(a) have been fully considered but they are not persuasive.

Claims 1,26,43,46,49, and 50

(A) The Appellant argued that Van Lieshout does not teach allocating a scheduled uplink transmission resource and TCP command on a shared physical channel that is also used to carry allocation and scheduling information from a base station to a remote transceiver (See pages 13, after Rejections under 35 U.S.C. 103 (a), first to third paragraphs, lines 1-11).

In response to the argument (A), the examiner respectfully disagrees with the appellant's argument. First of all, the Examiner points to Zeira, page 2, lines 14-21 and page 4, line 17-page 5, line 8, teaches determining a path loss of a radio channel between a base station and the remote transceiver, receiving a transmit power control (TPC) command, calculating, at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level).*

Further, the Examiner draws attention to paragraph [0012] , [0052], and [0054] of Chen et al., which states:

[0012] It is an object of the present invention to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications method.

[0052] the resource allocating unit 14 is configured to allocate a radio resource which is used in uplink packet communications with the mobile station, by referring to the virtual buffer corresponding to the mobile station 30.

[0054] The transmitting unit 15 is configured to notify the radio resources allocated by the resource allocating 14 to the mobile station via a downlink dedicated control channel (DCCH).

As indicated by Chen et al. in paragraphs [0052] and [0054] that downlink dedicated control channel (DCCH) used to carry allocation and scheduling information and receiving an allocation of a scheduled uplink transmission resource, but does not teach shared physical channel used to ....

On the other hand, the Examiner draws attentions to Paragraph [0006] of Van Lieshout et al. which states:

[0006] In one example implementation of the present invention, a computer-generated data signal, (e.g., generated in a computer in the DRNC), is transported on a separate transport bearer between the DRNC and the base station having a particular format. A frame number field includes a specific frame number identifying a frame on the shared radio channel. A transport format indicator field includes information relating to a particular radio channel resource in the corresponding frame. In one example implementation, the transport format indicator field includes an index to a transport format table previously stored in the mobile radio unit. In other words, the index addresses particular entries in the look-up table so the mobile can retrieve certain information that will allow it to receive and decode information intended for that mobile radio unit on the shared radio channel. For example, since the DRNC is in charge of **scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources**, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the **shared radio channel**.

As indicated by the Van Lieshout et al. in paragraph [0006] of underlying part that on a shared physical channel (shared radio channel) used to carry allocation and scheduling information. Therefore, combining both, Chen et al. and Van Lieshout et al., teach the limitations “allocating a scheduled uplink transmission resource and TCP command on a shared physical channel that is also used to carry allocation and scheduling information from a base station to a remote transceiver”.

Therefore, the Examiner respectfully submits that the rejection of claims 1-4,7-8,15-17,26,28,30-34, and 43-50 under 35 U.S.C. 103(a) is proper.

(11) Related Proceeding(s) Appendix

6. No decision rendered by a court or the Board is identified by the examiner in the Related Appeals and Interferences section of this examiner's answer.

For the above reasons, it is believed that the rejections should be sustained.

CHANGE IN ENTITY STATUS TO LARGE

Sir:

In accordance with 37 C.F.R. §1.28(b), written notification is hereby provided to the U.S. Patent and Trademark Office that the assertion of small entity status is no longer claimed in the above-identified patent. The Assignee of the present patent is a large entity under 37 C.F.R. §1.27(a)(3) and hereby requests that the record show that large entity status. A copy of the face page of said patent is attached for your convenience.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

BEFORE THE BOARD OF PATENT APPEALS AND INTERFERENCES

Application No. 10/917,968	*Confirmation No. 3609*
Filed: August 12, 2004	
Applicants: Nicholas William Anderson	This Reply Brief was electronically filed on May 31, 2011 using EFS-Web.
Title: POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM	
Art Unit: 2618	
Examiner: Dominic E. Rego	
Attorney Docket: 9147-96606-US	
Customer No.: 22242	

REPLY BRIEF UNDER 37 C.F.R. § 41.41

Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450

Pursuant to 37 C.F.R. § 41.41, the applicants hereby respectfully submit the following Reply Brief in response to the Examiner's Answer of March 29, 2011.

For the most part, the Examiner has not raised new arguments in his Answer and hence the contents of the earlier-submitted Appeal Brief remain relevant and largely without need for supplementation. The Examiner did offer, however, certain points of specificity that, by their degree of precision, are suitable to address here.

(1) Withdrawn rejections

First, we hereby acknowledge with thanks that the Examiner has withdrawn the earlier rejections under 35 U.S.C. 101 and 35 U.S.C. 112. This leaves only the rejections under 35 U.S.C. 103(a) that the Examiner continues to defend.

(2) Rejections under 35 U.S.C. 103(a)

The substantive bulk of the Examiner's Answer is a word-for-word copy of the Final Rejection with the exception of the section entitled "Response to Argument" that begins on page 21 of the Examiner's Answer. In this section, the Examiner provides helpful clarification regarding his reliance on Van Lieshout as teaching the use of a "shared physical channel" to "carry allocation and scheduling information." We say "helpful" because the Examiner's specificity now makes clear the source of the Examiner's error in his interpretation of Van Lieshout.

In particular, the Examiner relies on paragraph 0006 of Van Lieshout and emphasizes a particular portion thereof as follows[1]:

> For example, since the DRNC is in charge of **scheduling how data is multiplexed in a frame on the shared radio channel and allocating particular radio resources**, such as channelization codes and associated spreading factors, the DRNC can convey to the mobile radio, using the transport format indicator, these types of specific details to allow the mobile radio unit to decode information sent over the **shared radio channel**.

The Examiner is interpreting this language as saying that Van Lieshout transmits allocation and scheduling information to the mobile radio over a "shared radio channel." This, however, is an incorrect interpretation of Van Lieshout's sentence and represents instead a grammatically-inappropriate twisting of these words.

In fact, Van Lieshout refers here to a "shared radio channel" *not* as the channel by which the DRNC *conveys* the data multiplexing scheme, channelization codes, and spreading factors to the mobile radio unit but rather as the channel to which the data multiplexing

1 *Examiner's Answer* at page 23, emphasis appearing in the original.

scheme, channelization codes, and spreading factors *apply*. Van Lieshout's words are unambiguous in this regard – "[The DRNC can convey these types of specific details] to allow the mobile radio unit to decode information over the shared radio channel."

Therefore, contrary to the Examiner's position, Van Lieshout does not teach using a shared radio channel to convey allocation and scheduling information. Instead, Van Lieshout only teaches conveying information that a receiving device can then use to decode information that is later and otherwise received over a shared radio channel. Since there is nothing is Van Lieshout that suggests conveying allocation and scheduling information over a shared radio channel, there is nothing in Van Lieshout that can fairly be utilized to backfill the admitted deficiencies with the other references being relied upon for this rejection under 35 U.S.C. 103(a).

We therefore continue to respectfully request that the Board reverse the Examiner's rejection of the claims under 35 U.S.C. 103(a).

Respectfully submitted,

Date: May 31, 2011

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

ORDER REMANDING APPEAL TO EXAMINER

This application was electronically received by the Board of Patent Appeals and Interferences on June 13, 2011. A Docketing Notice was mailed on June 14, 2011. Upon review of the application, it has been determined that a remand to the Examiner is necessary to consider the following issues and to take necessary corrective action.

AMENDMENT AFTER FINAL NOT CONSIDERED

An After Final Amendment was filed in this application on December 3, 2010. There is no indication in the record that the After Final Amendment was considered by the Examiner. The Examiner needs to determine if the After Final Amendment will or will not be entered, and notify appellant of said entry or non-entry.

Accordingly, it is ordered that the application is remanded to the Examiner:

1) to consider the Amendment After Final filed December 3, 2010;

2) to notify appellant of the entry or non-entry of the Amendment After Final filed December 3, 2010; and

3) for further action as may be appropriate.

If there are any questions pertaining to this Order, please contact the Board of Patent Appeals and Interferences at 571-272-9797.

Advisory Action Before the Filing of an Appeal Brief	Application No.	Applicant(s)	
	10/917,968	ANDERSON, NICHOLAS WILLIAM	
	Examiner	Art Unit	
	DOMINIC E. REGO	2618	

--The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

THE REPLY FILED 03 December 2010 FAILS TO PLACE THIS APPLICATION IN CONDITION FOR ALLOWANCE.

1. ☒ The reply was filed after a final rejection, but prior to or on the same day as filing a Notice of Appeal. To avoid abandonment of this application, applicant must timely file one of the following replies: (1) an amendment, affidavit, or other evidence, which places the application in condition for allowance; (2) a Notice of Appeal (with appeal fee) in compliance with 37 CFR 41.31; or (3) a Request for Continued Examination (RCE) in compliance with 37 CFR 1.114. The reply must be filed within one of the following time periods:
   a) ☒ The period for reply expires 3 months from the mailing date of the final rejection.
   b) ☐ The period for reply expires on: (1) the mailing date of this Advisory Action, or (2) the date set forth in the final rejection, whichever is later. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of the final rejection.
   Examiner Note: If box 1 is checked, check either box (a) or (b). ONLY CHECK BOX (b) WHEN THE FIRST REPLY WAS FILED WITHIN TWO MONTHS OF THE FINAL REJECTION. See MPEP 706.07(f).

Extensions of time may be obtained under 37 CFR 1.136(a). The date on which the petition under 37 CFR 1.136(a) and the appropriate extension fee have been filed is the date for purposes of determining the period of extension and the corresponding amount of the fee. The appropriate extension fee under 37 CFR 1.17(a) is calculated from: (1) the expiration date of the shortened statutory period for reply originally set in the final Office action; or (2) as set forth in (b) above, if checked. Any reply received by the Office later than three months after the mailing date of the final rejection, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

NOTICE OF APPEAL

2. ☐ The Notice of Appeal was filed on _____. A brief in compliance with 37 CFR 41.37 must be filed within two months of the date of filing the Notice of Appeal (37 CFR 41.37(a)), or any extension thereof (37 CFR 41.37(e)), to avoid dismissal of the appeal. Since a Notice of Appeal has been filed, any reply must be filed within the time period set forth in 37 CFR 41.37(a).

AMENDMENTS

3. ☒ The proposed amendment(s) filed after a final rejection, but prior to the date of filing a brief, will not be entered because
   (a) ☒ They raise new issues that would require further consideration and/or search (see NOTE below);
   (b) ☐ They raise the issue of new matter (see NOTE below);
   (c) ☐ They are not deemed to place the application in better form for appeal by materially reducing or simplifying the issues for appeal; and/or
   (d) ☐ They present additional claims without canceling a corresponding number of finally rejected claims.
   NOTE: _____. (See 37 CFR 1.116 and 41.33(a)).
4. ☐ The amendments are not in compliance with 37 CFR 1.121. See attached Notice of Non-Compliant Amendment (PTOL-324).
5. ☐ Applicant's reply has overcome the following rejection(s): _____.
6. ☐ Newly proposed or amended claim(s) _____ would be allowable if submitted in a separate, timely filed amendment canceling the non-allowable claim(s).
7. ☒ For purposes of appeal, the proposed amendment(s): a) ☒ will not be entered, or b) ☐ will be entered and an explanation of how the new or amended claims would be rejected is provided below or appended.
   The status of the claim(s) is (or will be) as follows:
   Claim(s) allowed: _____.
   Claim(s) objected to: _____.
   Claim(s) rejected: *1-4, 7, 8, 15-17, 26, 28, 30-34, and 43-50*.
   Claim(s) withdrawn from consideration: _____.

AFFIDAVIT OR OTHER EVIDENCE

8. ☐ The affidavit or other evidence filed after a final action, but before or on the date of filing a Notice of Appeal will not be entered because applicant failed to provide a showing of good and sufficient reasons why the affidavit or other evidence is necessary and was not earlier presented. See 37 CFR 1.116(e).
9. ☐ The affidavit or other evidence filed after the date of filing a Notice of Appeal, but prior to the date of filing a brief, will not be entered because the affidavit or other evidence failed to overcome all rejections under appeal and/or appellant fails to provide a showing a good and sufficient reasons why it is necessary and was not earlier presented. See 37 CFR 41.33(d)(1).
10. ☐ The affidavit or other evidence is entered. An explanation of the status of the claims after entry is below or attached.

REQUEST FOR RECONSIDERATION/OTHER

11. ☐ The request for reconsideration has been considered but does NOT place the application in condition for allowance because: _____.
12. ☐ Note the attached Information *Disclosure Statement*(s). (PTO/SB/08) Paper No(s). _____
13. ☐ Other: _____.

AMENDMENT B AND RESPONSE

Sir:

Applicants hereby petition under 37 CFR § 1.136(a) for a three-month extension of time in the above-identified application, up to and including December 3, 2010, to make this reply timely.

Please amend the above-identified patent application as follows:

Amendments to the Claims are reflected in the listing of claims beginning on page 2 of this paper; and

Remarks begin on page 8 of this paper.

Appeal No: 2011-010366
Application: 10/917,968
Appellant: Nicholas William Anderson

Board of Patent Appeals and Interferences
Docketing Notice

Application 10/917,968 was received from the Technology Center at the Board on June 20, 2011 and has been assigned Appeal No: 2011-010366.

In all future communications regarding this appeal, please include both the application number and the appeal number.

The mailing address for the Board is:

BOARD OF PATENT APPEALS AND INTERFERENCES
UNITED STATES PATENT AND TRADEMARK OFFICE
P.O. BOX 1450
ALEXANDRIA, VIRGINIA 22313-1450

The facsimile number of the Board is 571-273-0052. Because of the heightened security in the Washington D.C. area, facsimile communications are recommended. Telephone inquiries can be made by calling 571-272-9797 and referencing the appeal number listed above.

By order of the Board of Patent Appeals and Interferences.

ART UNIT	**PAPER NUMBER**
2618	
MAIL DATE	**DELIVERY MODE**
09/01/2011	PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Advisory Action Before the Filing of an Appeal Brief	Application No. 10/917,968	Applicant(s) ANDERSON, NICHOLAS WILLIAM
	Examiner DOMINIC E. REGO	Art Unit 2618

--The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

THE REPLY FILED 03 December 2010 FAILS TO PLACE THIS APPLICATION IN CONDITION FOR ALLOWANCE.

1. ☒ The reply was filed after a final rejection, but prior to or on the same day as filing a Notice of Appeal. To avoid abandonment of this application, applicant must timely file one of the following replies: (1) an amendment, affidavit, or other evidence, which places the application in condition for allowance; (2) a Notice of Appeal (with appeal fee) in compliance with 37 CFR 41.31; or (3) a Request for Continued Examination (RCE) in compliance with 37 CFR 1.114. The reply must be filed within one of the following time periods:
   a) ☒ The period for reply expires 3 months from the mailing date of the final rejection.
   b) ☐ The period for reply expires on: (1) the mailing date of this Advisory Action, or (2) the date set forth in the final rejection, whichever is later. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of the final rejection.
   Examiner Note: If box 1 is checked, check either box (a) or (b). ONLY CHECK BOX (b) WHEN THE FIRST REPLY WAS FILED WITHIN TWO MONTHS OF THE FINAL REJECTION. See MPEP 706.07(f).

Extensions of time may be obtained under 37 CFR 1.136(a). The date on which the petition under 37 CFR 1.136(a) and the appropriate extension fee have been filed is the date for purposes of determining the period of extension and the corresponding amount of the fee. The appropriate extension fee under 37 CFR 1.17(a) is calculated from: (1) the expiration date of the shortened statutory period for reply originally set in the final Office action; or (2) as set forth in (b) above, if checked. Any reply received by the Office later than three months after the mailing date of the final rejection, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

NOTICE OF APPEAL

2. ☐ The Notice of Appeal was filed on ____. A brief in compliance with 37 CFR 41.37 must be filed within two months of the date of filing the Notice of Appeal (37 CFR 41.37(a)), or any extension thereof (37 CFR 41.37(e)), to avoid dismissal of the appeal. Since a Notice of Appeal has been filed, any reply must be filed within the time period set forth in 37 CFR 41.37(a).

AMENDMENTS

3. ☐ The proposed amendment(s) filed after a final rejection, but prior to the date of filing a brief, will not be entered because
   (a) ☐ They raise new issues that would require further consideration and/or search (see NOTE below);
   (b) ☐ They raise the issue of new matter (see NOTE below);
   (c) ☐ They are not deemed to place the application in better form for appeal by materially reducing or simplifying the issues for appeal; and/or
   (d) ☐ They present additional claims without canceling a corresponding number of finally rejected claims.
   NOTE: ____. (See 37 CFR 1.116 and 41.33(a)).
4. ☐ The amendments are not in compliance with 37 CFR 1.121. See attached Notice of Non-Compliant Amendment (PTOL-324).
5. ☐ Applicant's reply has overcome the following rejection(s): ____.
6. ☐ Newly proposed or amended claim(s) ____ would be allowable if submitted in a separate, timely filed amendment canceling the non-allowable claim(s).
7. ☒ For purposes of appeal, the proposed amendment(s): a) ☐ will not be entered, or b) ☒ will be entered and an explanation of how the new or amended claims would be rejected is provided below or appended.
   The status of the claim(s) is (or will be) as follows:
   Claim(s) allowed: ____.
   Claim(s) objected to: ____.
   Claim(s) rejected: *1-4,8,15-17,26,28,30-34 and 43-50*.
   Claim(s) withdrawn from consideration: ____.

AFFIDAVIT OR OTHER EVIDENCE

8. ☐ The affidavit or other evidence filed after a final action, but before or on the date of filing a Notice of Appeal will not be entered because applicant failed to provide a showing of good and sufficient reasons why the affidavit or other evidence is necessary and was not earlier presented. See 37 CFR 1.116(e).
9. ☐ The affidavit or other evidence filed after the date of filing a Notice of Appeal, but prior to the date of filing a brief, will not be entered because the affidavit or other evidence failed to overcome all rejections under appeal and/or appellant fails to provide a showing a good and sufficient reasons why it is necessary and was not earlier presented. See 37 CFR 41.33(d)(1).
10. ☐ The affidavit or other evidence is entered. An explanation of the status of the claims after entry is below or attached.

REQUEST FOR RECONSIDERATION/OTHER

11. ☐ The request for reconsideration has been considered but does NOT place the application in condition for allowance because: ____.
12. ☐ Note the attached Information *Disclosure Statement*(s). (PTO/SB/08) Paper No(s). ____
13. ☒ Other: See Continuation Sheet.

/DOMINIC E REGO/
Primary Examiner, Art Unit 2618

Continuation of 13. Other: After Final rejection was issued on 01/08/2010 with the 35 U.S.C. 101 rejection, Applicant filed Appeal Brief on 12/03/2010. Further, beside that Appeal Brief, Applicant also filed separate claim set by amending claim 26. After consulting with SPEs, 35 USC 101 rejection was withdrawn, but 35 U.S.C. 103(a) rejection is still stand. Therefore, after Final Amendment filed on 12/03/2010 is entered and considered by the Examiner .

CERTIFICATION STATEMENT

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

☒ That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

OR

☐ That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

☐ See attached certification statement.

☒ The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

☐ A certification statement is not submitted herewith.

SIGNATURE

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these record s.

2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.

3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.

4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).

5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.

6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).

7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.

8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.

9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

<u>New Applications Under 35 U.S.C. 111</u>
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

<u>National Stage of an International Application under 35 U.S.C. 371</u>
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

<u>New International Application Filed with the USPTO as a Receiving Office</u>
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

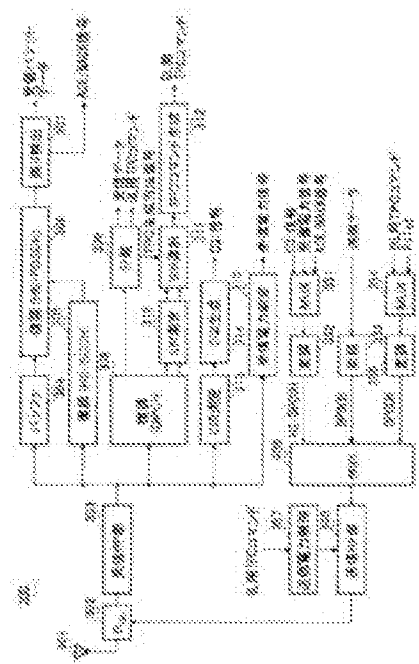
(54) TRANSMISSION POWER CONTROL METHOD, SIGNALING METHOD, COMMUNICATION TERMINAL, AND BASE STATION APPARATUS

(57)Abstract:



PROBLEM TO BE SOLVED: To improve a system throughput by properly controlling transmission power of an A-DPCH in a radio communication system performing HSDPA services.

SOLUTION: An SIR measurement section 310 measures a received SIR of a downlink channel for each base station apparatus to be connected. An SIR selection section 311 receives a TPC generating method signal demodulated by a demodulation section 308 and demultiplexed from a data by a demultiplexer section 309, and outputs the composite value of the received SIR to a TPC command generating section 312 when the TPC generating method signal indicates a TPC command generating method of a composite value reference. The SIR selection section 311 outputs, on the other hand, only the received SIR of a signal transmitted from a primary base station apparatus to the TPC command generating section 312 when the TPC generating method signal indicates a TPC command generating method of a primary reference. The TPC command generating section 312 generates a TPC command for DL on the basis of the magnitude relation between the received SIR outputted from the SIR selection section 311 and the target SIR.

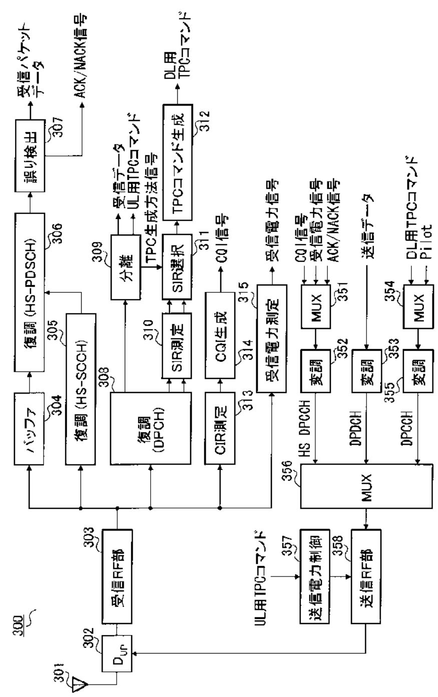
(54)【発明の名称】送信電力制御方法、シグナリング方法、通信端末装置及び基地局装置

(57)【要約】

【課題】ＨＳＤＰＡサービスを行う無線通信システムにおいてＡ－ＤＰＣＨの送信電力を適正に制御し、システムスループットの向上を図ること。

【解決手段】ＳＩＲ測定部３１０は、下り回線の受信ＳＩＲを、接続する基地局装置毎に測定する。ＳＩＲ選択部３１１は、復調部３０８で復調され、分離部３０９でデータと分離されたＴＰＣ生成方法信号を入力し、ＴＰＣ生成方法信号が合成値基準のＴＰＣコマンド生成方法を示す場合、受信ＳＩＲの合成値をＴＰＣコマンド生成部３１２に出力する。一方、ＳＩＲ選択部３１１は、ＴＰＣ生成方法信号がプライマリ基準のＴＰＣコマンド生成方法を示す場合、プライマリ基地局装置から送信された信号の受信ＳＩＲのみをＴＰＣコマンド生成部３１２に出力する。ＴＰＣコマンド生成部３１２は、ＳＩＲ選択部３１１から出力された受信ＳＩＲと目標ＳＩＲとの大小関係によりＤＬ用ＴＰＣコマンドを生成する。

【選択図】　図４



【特許請求の範囲】

【請求項１】

ＨＳ－ＳＣＣＨで信号を送信する第１基地局装置が、ＨＳＤＰＡサービスを受ける通信端末装置に対して、ＨＳ－ＰＤＳＣＨにて信号を送信する際に自局のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成することを指示し、前記通信端末装置から送信されたＴＰＣコマンドに基づいてＡ－ＤＰＣＨの送信電力を制御することを特徴とする送信電力制御方法。

【請求項２】

ＨＳＤＰＡサービスを受ける通信端末装置が、制御局装置から送信された第１信号によりＨＳ－ＳＣＣＨで信号を送信する第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づく第１のＴＰＣコマンド生成方法を指示された場合、前記第１の基地局装置から送信されたＴＰＣコマンド生成方法の切り替えを指示する第２信号に基づいてＴＰＣコマンドを生成し、前記第１の基地局装置が、前記通信端末装置から送信されたＴＰＣコマンドに基づいてＡ－ＤＰＣＨの送信電力を制御することを特徴とする送信電力制御方法。

【請求項３】

第１基地局装置が、ＨＳ－ＰＤＳＣＨにて信号を送信する際に、自局のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成することを指示し、ＨＳ－ＰＤＳＣＨにて信号を送信しない際には、接続する基地局装置のＡ－ＤＰＣＨの受信ＳＩＲの合成値と目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成することを指示する第２信号を生成することを特徴とする請求項２記載の送信電力制御方法。

【請求項４】

制御局装置が、ＨＳ－ＳＣＣＨで信号を送信する第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づく第１のＴＰＣコマンド生成方法、あるいは、接続する基地局装置のＡ－ＤＰＣＨの受信ＳＩＲの合成値と目標ＳＩＲとの比較結果に基づく第２のＴＰＣコマンド生成方法のどちらかを指示する第１信号を生成し、基地局装置が、ＨＳ－ＰＤＳＣＨで送信する信号の有無に基づいて前記第１のＴＰＣコマンド生成方法あるいは前記第２のＴＰＣコマンド生成方法のどちらかを指示する第２信号を生成し、通信端末装置が、受信した前記第１信号及び前記第２信号の指示に基づいてＴＰＣコマンド生成方法を選択することを特徴とするシグナリング方法。

【請求項５】

制御局装置が、ＨＳＤＰＡサービスを受ける通信端末装置の中でハンドオーバ状態にあるものに対して、第１のＴＰＣコマンド生成方法を指示する第１信号を生成することを特徴とする請求項４記載のシグナリング方法。

【請求項６】

基地局装置が、ＨＳ－ＰＤＳＣＨにて信号を送信する際に第１のＴＰＣコマンド生成方法を指示し、ＨＳ－ＰＤＳＣＨにて信号を送信しない際には、接続する基地局装置のＡ－ＤＰＣＨの受信ＳＩＲの合成値と目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成することを指示する第２信号を生成することを特徴とする請求項４又は請求項５記載のシグナリング方法。

【請求項７】

通信端末装置が、第１信号及び第２信号が第１のＴＰＣコマンド生成方法を指示する場合のみ、ＨＳ－ＳＣＣＨで信号を送信する第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づいてＴＰＣコマンドを生成することを特徴とする請求項６記載のシグナリング方法。

【請求項８】

接続する基地局装置のＤＰＣＨの受信ＳＩＲを測定するＳＩＲ測定手段と、ＨＳ－ＳＣＣＨで信号を送信する第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲあるいは測定された受信ＳＩＲの合成値のいずれかを制御局装置にて生成された第１信号及び基地局装置にて生成

された第２信号の指示に基づいて選択するＳＩＲ選択手段と、このＳＩＲ選択手段に選択された値と目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成するＴＰＣ生成手段とを具備することを特徴とする通信端末装置。

【請求項９】

ＳＩＲ選択手段は、第１信号及び第２信号が第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲの選択を指示する場合のみ、第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲを選択することを特徴とする請求項８記載の通信端末装置。

【請求項１０】

請求項８又は請求項９記載の通信端末装置にＨＳ－ＰＤＳＣＨにて送信するパケット信号を蓄積するバッファと、前記バッファにパケット信号が蓄積されているか否かに基づいて第２信号を生成する切替手段とを具備することを特徴とする基地局装置。

【請求項１１】

切替手段は、バッファにパケット信号が蓄積されている際に、自局のＡ－ＤＰＣＨの受信ＳＩＲの選択を指示する第２信号を生成することを特徴とする請求項１０記載の基地局装置。

【発明の属する技術分野】

本発明は、下り回線で高速パケット伝送を行う無線通信システムに使用される送信電力制御方法、シグナリング方法、通信端末装置及び基地局装置に関し、特に、Ｗ－ＣＤＭＡ方式におけるＨＳＤＰＡに適用するに好適である。

【０００２】

【従来の技術】

無線通信システムの分野において、高速大容量な下りチャネルを複数の通信端末装置が共有し、下り回線で高速パケット伝送を行うＨＳＤＰＡ（Ｈｉｇｈ Ｓｐｅｅｄ Ｄｏｗｎｌｉｎｋ Ｐａｃｋｅｔ Ａｃｃｅｓｓ）が提案されている。ＨＳＤＰＡでは、ＨＳ－ＰＤＳＣＨ（Ｈｉｇｈ Ｓｐｅｅｄ － Ｐｈｙｓｉｃａｌ Ｄｏｗｎｌｉｎｋ Ｓｈａｒｅｄ Ｃｈａｎｎｅｌ）、ＨＳ－ＳＣＣＨ（Ｓｈａｒｅｄ Ｃｏｎｔｒｏｌ Ｃｈａｎｎｅｌ ｏｆ ＨＳ－ＰＤＳＣＨ）、Ａ－ＤＰＣＨ（Ａｓｓｏｃｉａｔｅｄ－Ｄｅｄｉｃａｔｅｄ Ｐｈｙｓｉｃａｌ Ｃｈａｎｎｅｌ ｆｏｒ ＨＳ－ＰＤＳＣＨ）等の複数のチャネルが用いられる。なお、Ａ－ＤＰＣＨはＨＳＤＰＡ伝送を行う際に付随チャネルとして使用するために設けられたＤＰＣＨチャネルであり、そのチャネル構成やハンドオーバ制御等はＤＰＣＨとかわらない。

【０００３】

ＨＳ－ＰＤＳＣＨは、パケットの伝送に使用される下り方向の共有チャネルでる。ＨＳ－ＳＣＣＨは、下り方向の共有チャネルであり、リソース割り当てに関する情報（ＴＦＲＩ：Ｔｒａｎｓｐｏｒｔ－ｆｏｒｍａｔ ａｎｄ Ｒｅｓｏｕｒｃｅ ｒｅｌａｔｅｄ Ｉｎｆｏｒｍａｔｉｏｎ）、Ｈ－ＡＲＱ（Ｈｙｂｒｉｄ－Ａｕｔｏｍａｔｉｃ Ｒｅｐｅａｔ Ｒｅｑｕｅｓｔ）制御に関する情報等が伝送される。

【０００４】

Ａ－ＤＰＣＨは、上り方向及び下り方向の個別付随チャネルであり、パイロット信号、ＴＰＣコマンド等が伝送され、上り方向では、これらに加えてＡＣＫ信号あるいはＮＡＣＫ信号、ＣＱＩ（Ｃｈａｎｎｅｌ Ｑｕａｌｉｔｙ Ｉｎｄｉｃａｔｏｒ）信号が伝達される。なお、ＡＣＫ信号とは、基地局装置から送信されたＨＳ－ＰＤＳＣＨ上の高速パケットが、通信端末装置において正しく復調できたことを示す信号であり、ＮＡＣＫ信号とは、基地局装置から送信されたＨＳ－ＰＤＳＣＨ上の高速パケットが、通信端末装置において正しく復調できなかったことを示す信号である。また、ＣＱＩは、当該各通信端末装置において復調可能なパケットデータの変調方式及び符号化率を示す信号である。

【０００５】

以下、Ａ－ＤＰＣＨとＨＳ－ＳＣＣＨとの受信ＳＩＲ（Ｓｉｇｎａｌ ｔｏ Ｉｎｔｅｒ ｆｅｒｅｎｃｅ　Ｒａｔｉｏ）の関係について図１２、図１３を用いて説明する。図１２は、ＨＯ（Ｈａｎｄ　Ｏｖｅｒ）状態ではない場合を示し、図１３は、ＨＯ状態の場合を示す。ここでＨＯ状態とは、複数の基地局またはセクタと同時に通信回線を接続している状態を示し、一般的に良く知られているソフトハンドオーバ（ＳＨＯ）状態であることを示す。

【０００６】

図１２に示すように、Ａ－ＤＰＣＨの送信電力１１は、一般的に良く知られているクローズドループ送信電力制御方法によって、Ａ－ＤＰＣＨの受信ＳＩＲ１２が目標ＳＩＲ１３となるように制御される。

【０００７】

ＨＳ－ＳＣＣＨの送信電力２１は、ＨＳ－ＳＣＣＨの所要ＳＩＲ２３がＡ－ＤＰＣＨの目標ＳＩＲ１３と異なるため、Ａ－ＤＰＣＨの送信電力１１にオフセットをつけて設定される。これにより、ＨＯ状態ではない場合には、ＨＳ－ＳＣＣＨの受信ＳＩＲ２２がほぼ所要ＳＩＲ２３に保たれる。

【０００８】

ここで、ＤＰＣＨは、ＨＯ状態時には複数の受信信号を合成したＳＩＲが目標ＳＩＲとなるように送信電力が制御される。これにより、ダイバーシチゲインによりＨＯ状態でない場合に比較して送信電力を低減することができる。従来方式では、Ａ－ＤＰＣＨの送信電力も、ＤＰＣＨと同様に、ＨＯ状態時には、複数の受信信号を合成した後の品質が所要品質を満足するように制御している。

【０００９】

一方、ＨＳ－ＰＤＳＣＨ及びＨＳ－ＳＣＣＨは、伝搬路状態に応じた適応的なＭＣＳ（Ｍｏｄｕｌａｔｉｏｎ　ａｎｄ　Ｃｏｄｉｎｇ　Ｓｃｈｅｍｅ：変調方式と誤り訂正符号の組み合わせ）選択、Ｈ－ＡＲＱ制御が行われるためＳＨＯ（Ｓｏｆｔ　Ｈａｎｄ　Ｏｖｅｒ）状態にはならずにＨＨＯ（Ｈａｒｄ　Ｈａｎｄ　Ｏｖｅｒ）が適用され、常に、１つの基地局装置から信号が送信される（以下、ＨＳ－ＳＣＣＨで信号を送信する基地局装置を「プライマリ基地局装置」という）。

【００１０】

したがって、ＨＯ状態にないＡ－ＤＰＣＨの送信電力に基づいて上記電力オフセット値を設定すると、Ａ－ＤＰＣＨがＨＯ状態にある場合においてＨＳ－ＳＣＣＨの受信ＳＩＲが所要ＳＩＲに届かず、受信品質が劣化してしまい、再送回数が増大してシステムスループットが劣化してしまう。

【００１１】

例えば、図１３において、通信端末装置が基地局装置Ａ及び基地局装置Ｂと接続しているとすると、通信端末装置は、基地局装置ＡのＡ－ＤＰＣＨの受信ＳＩＲ３１と基地局装置ＢのＡ－ＤＰＣＨの受信ＳＩＲ３２を合成したＳＩＲ３３が目標ＳＩＲ３４となるようにＴＰＣコマンドを生成する。したがって、基地局装置ＡのＡ－ＤＰＣＨの受信ＳＩＲ３１は目標ＳＩＲ３４よりも低くなる。

【００１２】

このとき、基地局装置Ａがプライマリ基地局装置であるとすると、ＨＳ－ＳＣＣＨの送信電力は、基地局装置ＡのＡ－ＤＰＣＨの送信電力にオフセットつけて設定されるので、ＨＯ状態ではＨＳ－ＳＣＣＨの受信ＳＩＲ４１が所要ＳＩＲ４２を満たさなくなる。

【００１３】

【発明が解決しようとする課題】

しかしながら、ＨＯ状態においてもＨＳ－ＳＣＣＨの受信ＳＩＲが所要ＳＩＲを満たすように上記電力オフセット値を大きく設定すると、Ａ－ＤＰＣＨがＨＯ状態にない場合においてＨＳ－ＳＣＣＨの送信電力が過剰となり、有限な無線リソースである送信電力を余計に消費してしまい、システムスループットが低下してしまうという問題がある。

【００１４】

本発明はかかる点に鑑みてなされたものであり、ＨＳＤＰＡサービスを行う無線通信シス

テムにおいてシステムスループットの向上を図ることができる送信電力制御方法、シグナリング方法、通信端末装置及び基地局装置を提供することを目的とする。
【００１５】
【課題を解決するための手段】
本発明の送信電力制御方法は、ＨＳ－ＳＣＣＨで信号を送信する第１基地局装置が、ＨＳＤＰＡサービスを受ける通信端末装置に対して、ＨＳ－ＰＤＳＣＨにて信号を送信する際に自局のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成することを指示し、前記通信端末装置から送信されたＴＰＣコマンドに基づいてＡ－ＤＰＣＨの送信電力を制御する方法をとる。
【００１６】
本発明の送信電力制御方法は、ＨＳＤＰＡサービスを受ける通信端末装置が、制御局装置から送信された第１信号によりＨＳ－ＳＣＣＨで信号を送信する第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づく第１のＴＰＣコマンド生成方法を指示された場合、前記第１の基地局装置から送信されたＴＰＣコマンド生成方法の切り替えを指示する第２信号に基づいてＴＰＣコマンドを生成し、前記第１の基地局装置が、前記通信端末装置から送信されたＴＰＣコマンドに基づいてＡ－ＤＰＣＨの送信電力を制御する方法をとる。
【００１７】
本発明の送信電力制御方法は、第１基地局装置が、ＨＳ－ＰＤＳＣＨにて信号を送信する際に、自局のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成することを指示し、ＨＳ－ＰＤＳＣＨにて信号を送信しない際には、接続する基地局装置のＡ－ＤＰＣＨの受信ＳＩＲの合成値と目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成することを指示する第２信号を生成する方法をとる。
【００１８】
これらの方法により、ＨＳ－ＳＣＣＨで信号を送信する基地局装置のＡ－ＤＰＣＨの送信電力を抑えることができるので、システム容量の減少を防止することができる。
【００１９】
本発明のシグナリング方法は、制御局装置が、ＨＳ－ＳＣＣＨで信号を送信する第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づく第１のＴＰＣコマンド生成方法、あるいは、接続する基地局装置のＡ－ＤＰＣＨの受信ＳＩＲの合成値と目標ＳＩＲとの比較結果に基づく第２のＴＰＣコマンド生成方法のどちらかを指示する第１信号を生成し、基地局装置が、ＨＳ－ＰＤＳＣＨで送信する信号の有無に基づいて前記第１のＴＰＣコマンド生成方法あるいは前記第２のＴＰＣコマンド生成方法のどちらかを指示する第２信号を生成し、通信端末装置が、受信した前記第１信号及び前記第２信号の指示に基づいてＴＰＣコマンド生成方法を選択する方法をとる。
【００２０】
本発明のシグナリング方法は、制御局装置が、ＨＳＤＰＡサービスを受ける通信端末装置の中でハンドオーバ状態にあるものに対して、第１のＴＰＣコマンド生成方法を指示する第１信号を生成する方法をとる。
【００２１】
本発明のシグナリング方法は、基地局装置が、ＨＳ－ＰＤＳＣＨにて信号を送信する際に第１のＴＰＣコマンド生成方法を指示し、ＨＳ－ＰＤＳＣＨにて信号を送信しない際には、接続する基地局装置のＡ－ＤＰＣＨの受信ＳＩＲの合成値と目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成することを指示する第２信号を生成する方法をとる。
【００２２】
本発明のシグナリング方法は、通信端末装置が、第１信号及び第２信号が第１のＴＰＣコマンド生成方法を指示する場合のみ、ＨＳ－ＳＣＣＨで信号を送信する第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの比較結果に基づいてＴＰＣコマンドを生成す

る方法をとる。
【００２３】
これらの方法により、ＨＳ－ＳＣＣＨで信号を送信する基地局装置のＡ－ＤＰＣＨの送信電力を抑えることができるので、システム容量の減少を防止することができる。
【００２４】
本発明の通信端末装置は、接続する基地局装置のＤＰＣＨの受信ＳＩＲを測定するＳＩＲ測定手段と、ＨＳ－ＳＣＣＨで信号を送信する第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲあるいは測定された受信ＳＩＲの合成値のいずれかを制御局装置にて生成された第１信号及び基地局装置にて生成された第２信号の指示に基づいて選択するＳＩＲ選択手段と、このＳＩＲ選択手段に選択された値と目標ＳＩＲとの比較結果に基づいて下り回線用のＴＰＣコマンドを生成するＴＰＣ生成手段とを具備する構成をとる。
【００２５】
本発明の通信端末装置におけるＳＩＲ選択手段は、第１信号及び第２信号が第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲの選択を指示する場合のみ、第１基地局装置のＡ－ＤＰＣＨの受信ＳＩＲを選択する構成をとる。
【００２６】
本発明の基地局装置は、上記の通信端末装置にＨＳ－ＰＤＳＣＨにて送信するパケット信号を蓄積するバッファと、前記バッファにパケット信号が蓄積されているか否かに基づいて第２信号を生成する切替手段とを具備する構成をとる。
【００２７】
本発明の基地局装置における切替手段は、バッファにパケット信号が蓄積されている際に、自局のＡ－ＤＰＣＨの受信ＳＩＲの選択を指示する第２信号を生成する構成をとる。
【００２８】
これらの構成により、ＨＳ－ＳＣＣＨで信号を送信する基地局装置のＡ－ＤＰＣＨの送信電力を抑えることができるので、システム容量の減少を防止することができる。
【００２９】
【発明の実施の形態】
本発明の骨子は、ＨＳＤＰＡサービスを受ける通信端末装置において、少なくともＨＯ状態である場合には、プライマリ基地局装置のＡ－ＤＰＣＨの受信ＳＩＲが目標ＳＩＲとなるようにＴＰＣコマンドを生成することである。なお、本発明において、ＨＳＤＰＡサービスとは、ＨＳＤＰＡ伝送によって実現されるパケット通信サービスのことをいうものとする。
【００３０】
以下、本発明の実施の形態について、添付図面を参照して詳細に説明する。
【００３１】
（実施の形態１）
図１は、本発明の実施の形態１のシステム構成図である。
【００３２】
図１において、制御局（ＲＮＣ）１００は、複数の基地局装置（ＮｏｄｅＢ）２００と有線接続し、各基地局装置２００は、複数の通信端末装置（ＵＥ）３００と無線通信を行う。なお、以下の説明では、制御局装置１００が２つの基地局装置２００と有線接続し、各基地局装置２００が３つの通信端末装置３００と無線通信を行う場合を想定する。
【００３３】
次に、制御局装置１００の構成について図２のブロック図を用いて説明する。
【００３４】
信号処理部１０１は、接続する基地局装置の数だけ用意され、通信端末装置３００から送信され、基地局装置２００にて復号された信号を入力し、この信号をネットワーク網で伝送するに適した状態に処理し、分離部１０２に出力する。
【００３５】
分離部１０２は、接続する基地局装置の数だけ用意され、信号処理部１０１の出力信号か

らデータと制御信号を分離する。データは、ネットワーク網に出力される。分離部１０２にてデータと分離された制御信号の中には、通信端末装置３００が測定した周辺基地局装置の共通制御チャネルの受信電力を示す信号（以下、「受信電力信号」という）等が含まれる。

【００３６】

ハンドオーバ制御部１０３は、受信電力信号に基づいて各通信端末装置についてＨＯ状態にあるか否か、すなわち、セルエッジに存在するか否かを判定し、判定結果を示す信号（以下、「ＨＯ端末信号」という）をＴＰＣ生成方法選択部１０４に出力する。

【００３７】

ＴＰＣ生成方法選択部１０４は、接続する基地局装置の数だけ用意され、ＨＳＤＰＡサービスを受ける通信端末装置であって、かつ、ＨＯ状態であるものに対して、プライマリ基地局装置のＡ－ＤＰＣＨの受信ＳＩＲが目標ＳＩＲとなるようにＴＰＣコマンドを生成する方法（以下、「プライマリ基準のＴＰＣコマンド生成方法」という）を選択する。一方、ＨＳＤＰＡサービスを受ける通信端末装置であって、かつ、ＨＯ状態にないものに対して、接続する基地局装置のＤＰＣＨあるいはＡ－ＤＰＣＨの受信ＳＩＲの合成値が目標ＳＩＲとなるようにＴＰＣコマンドを生成する方法（以下、「合成値基準のＴＰＣコマンド生成方法」という）を選択する。そして、ＴＰＣ生成方法選択部１０４は、選択したＴＰＣコマンド生成方法を示す信号（以下、「ＴＰＣ生成方法信号」という）を多重部（ＭＵＸ）１０５に出力する。

【００３８】

多重部１０５は、接続する基地局装置の数だけ用意され、ネットワーク網からの入力信号にＴＰＣ生成方法信号を多重して、信号処理部１０６に出力する。信号処理部１０６は、接続する基地局装置の数だけ用意され、多重部１０５の出力信号を基地局装置で伝送するに適した状態に処理し、多重部１０７に出力する。

【００３９】

多重部１０７は、接続する基地局装置の数だけ用意され、信号処理部１０６の出力信号にパケット伝送用制御信号及びＨＳ－ＳＣＣＨのＡ－ＤＰＣＨに対する送信電力のオフセット値を示すオフセット信号等を多重して基地局装置２００に出力する。

【００４０】

次に、基地局装置２００の構成について図３のブロック図を用いて説明する。基地局装置２００は、各端末装置に送信するための個別データ、パケットデータ、パケット伝送用制御信号及びオフセット信号を制御局装置１００から入力する。また、基地局装置２００は、接続中の通信端末装置から無線送信された信号を受信する。

【００４１】

共用器２０２は、アンテナ２０１に受信された信号を受信ＲＦ部２０３に出力する。また、共用器２０２は、送信ＲＦ部２６６から出力された信号をアンテナ２０１から無線送信する。

【００４２】

受信ＲＦ部２０３は、共用器２０２から出力された無線周波数の受信信号をベースバンドのディジタル信号に変換し、復調部２０４に出力する。

【００４３】

復調部２０４は、無線通信を行う通信端末装置の数だけ用意され、受信ベースバンド信号に対して逆拡散、ＲＡＫＥ合成、誤り訂正復号等の復調処理を行い、分離部２０５に出力する。

【００４４】

分離部２０５は、復調部２０４の出力信号をデータと制御信号とに分離する。分離部２０５にて分離された制御信号には、ＤＬ（Ｄｏｗｎ　Ｌｉｎｋ）用ＴＰＣコマンド、ＣＱＩ信号、ＡＣＫ／ＮＡＣＫ信号、受信電力信号等が含まれる。ＣＱＩ信号及びＡＣＫ／ＮＡＣＫ信号はスケジューラ２５１に出力され、ＤＬ用ＴＰＣコマンドは送信電力制御部２５８に出力され、データ及び受信電力信号は制御局装置１００に出力される。

【００４５】
ＳＩＲ測定部２０６は、無線通信を行う通信端末装置の数だけ用意され、復調の過程で測定される希望波レベル及び干渉波レベルによって上り回線の受信ＳＩＲを測定し、ＳＩＲを示す信号をＴＰＣコマンド生成部２０７に出力する。
【００４６】
ＴＰＣコマンド生成部２０７は、無線通信を行う通信端末装置の数だけ用意され、上り回線の受信ＳＩＲと目標ＳＩＲとの大小関係により、上り回線の送信電力の増減を指示するＵＬ（Ｕｐ　Ｌｉｎｋ）用ＴＰＣコマンドを生成する。
【００４７】
スケジューラ２５１は、各通信端末装置からのＣＱＩ信号及びパケット伝送用制御信号等に基づいてパケットを送信する通信端末装置（以下、「送信先装置」という）を決定し、送信先装置を示す情報をバッファ（Ｑｕｅｕｅ）２５２に出力する。その際、スケジューラ２５１は、ＡＣＫ信号を入力した場合には新しいデータを送信するように、ＮＡＣＫ信号を入力した場合には前回送信したデータを再送するようにバッファ２５２に指示する。また、スケジューラ２５１は、送信先装置のＣＱＩ信号に基づいて変調方式及び符号化率を決定し、変調部２５３に指示する。また、スケジューラ２５１は、パケットデータの送信電力を決定する際に参照となる信号を送信電力制御部２５４に出力する。なお、本発明においてはパケットデータの送信電力制御方法に制限はなく、パケットデータの送信電力制御を行わなくとも良い。また、スケジューラ２５１は、ＨＳ－ＳＣＣＨによって送信先装置に送信する信号（以下、「ＨＳ－ＳＣＣＨ用信号」という）を増幅部２６１に出力する。ＨＳ－ＳＣＣＨ用信号には、パケットデータを送信するタイミング、パケットデータの符号化率及び変調方式等を示す情報（ＴＦＲＩ）が含まれる。
【００４８】
バッファ２５２は、スケジューラ２５１に指示された送信先装置に対するパケットデータを変調部２５３に出力する。
【００４９】
変調部２５３は、スケジューラ２５１の指示に従ってパケットデータに対して誤り訂正符号化、変調及び拡散を行って増幅部２５５に出力する。
【００５０】
送信電力制御部２５４は、増幅部２５５の増幅量を制御することにより、変調部２５３の出力信号の送信電力を制御する。増幅部２５５の出力信号は、ＨＳ－ＰＤＳＣＨで送信される信号であって、多重部２６５に出力される。
【００５１】
多重部２５６は、無線通信を行う通信端末装置の数だけ用意され、各通信端末装置に送信する個別データ（制御信号も含む）にパイロット信号及びＵＬ用ＴＰＣコマンドを多重して変調部２５７に出力する。
【００５２】
変調部２５７は、無線通信を行う通信端末装置の数だけ用意され、多重部２５６の出力信号に対して誤り訂正符号化、変調及び拡散を行って増幅部２５９に出力する。
【００５３】
送信電力制御部２５８は、無線通信を行う通信端末装置の数だけ用意され、ＤＬ用ＴＰＣコマンドに従って増幅部２５９の増幅量を制御することにより、変調部２５７の出力信号の送信電力を制御する。また、送信電力制御部２５８は、送信電力値を示す信号を送信電力制御部２６０に出力する。増幅部２５９にて増幅された信号は、ＤＰＣＨ（Ａ－ＤＰＣＨを含む）で送信される信号であって、多重部２６５に出力される。
【００５４】
送信電力制御部２６０は、送信電力制御部２５８の送信電力値にオフセットをつけた値で増幅部２６１の増幅量を制御することにより、スケジューラ２５１から出力されたＨＳ－ＳＣＣＨ用信号の送信電力を制御する。増幅部２６１にて増幅された信号は、ＨＳ－ＳＣＣＨで送信される信号であって、多重部２６５に出力される。なお、送信電力制御部２６

０は、再送状態等によりオフセット値を補正してもよい。
【００５５】
変調部２６２は、共通制御データに対して誤り訂正符号化、変調及び拡散を行って増幅部２６４に出力する。送信電力制御部２６３は、増幅部２６４の増幅量を制御することにより、変調部２６２の出力信号の送信電力を制御する。増幅部２６４の出力信号は、ＣＰＩＣＨ等で送信される信号であって、多重部２６５に出力される。
【００５６】
多重部２６５は、増幅部２５５、増幅部２５９、増幅部２６１及び増幅部２６４の各出力信号を多重し、送信ＲＦ部２６６に出力する。
【００５７】
送信ＲＦ部２６６は、多重部２６５から出力されたベースバンドのディジタル信号を無線周波数の信号に変換して共用器２０２に出力する。
【００５８】
次に、通信端末装置３００の構成について図４のブロック図を用いて説明する。通信端末装置３００は、基地局装置２００から個別データ、共通制御データ、パケットデータ、ＨＳ－ＳＣＣＨ用信号を受信する。
【００５９】
共用器３０２は、アンテナ３０１に受信された信号を受信ＲＦ部３０３に出力する。また、共用器３０２は、送信ＲＦ部３５８から出力された信号をアンテナ３０１から無線送信する。
【００６０】
受信ＲＦ部３０３は、共用器３０２から出力された無線周波数の受信信号をベースバンドのディジタル信号に変換し、ＨＳ－ＰＤＳＣＨの信号をバッファ３０４に出力し、ＨＳ－ＳＣＣＨ用信号を復調部３０５に出力し、ＤＰＣＨの信号を復調部３０８に出力し、共通制御チャネルの信号をＣＩＲ（Ｃａｒｒｉｅｒ　ｔｏ　Ｉｎｔｅｒｆｅｒｅｎｃｅ　Ｒａｔｉｏ）測定部３１３にする。
【００６１】
バッファ３０４は、ＨＳ－ＰＤＳＣＨの信号を一時的に保存して復調部３０６に出力する。
【００６２】
復調部３０５は、ＨＳ－ＳＣＣＨ用信号に対して逆拡散、ＲＡＫＥ合成、誤り訂正復号等の復調処理を行い、自局宛パケットデータの到来タイミング、当該パケットデータの符号化率及び変調方式等、パケットデータの復調に必要な情報を取得して復調部３０６に出力する。
【００６３】
復調部３０６は、復調部３０５にて取得された情報に基づいてバッファに保存されているＨＳ－ＰＤＳＣＨの信号に対して逆拡散、ＲＡＫＥ合成、誤り訂正復号等の復調処理を行い、復調処理によって得られたパケットデータを誤り検出部３０７に出力する。
【００６４】
誤り検出部３０７は、復調部３０６から出力されたパケットデータに対して誤り検出を行い、誤りが検出されなかった場合にはＡＣＫ信号を、誤りが検出されなかった場合にはＮＡＣＫ信号を多重部３５１に出力する。
【００６５】
復調部３０８は、ＤＰＣＨの信号に対して逆拡散、ＲＡＫＥ合成、誤り訂正復号等の復調処理を行い、分離部３０９に出力する。
【００６６】
分離部３０９は、復調部３０８の出力信号をデータと制御信号とに分離する。分離部３０９にて分離された制御信号には、ＵＬ用ＴＰＣコマンド、ＴＰＣ生成方法信号等が含まれる。ＵＬ用ＴＰＣコマンドは送信電力制御部３５７に出力され、ＴＰＣ生成方法信号はＳＩＲ選択部３１１に出力される。

【００６７】
ＳＩＲ測定部３１０は、復調の過程で測定される希望波レベル及び干渉波レベルによって下り回線の受信ＳＩＲを、接続する基地局装置毎に測定し、測定した全ての受信ＳＩＲをＳＩＲ選択部３１１に出力する。
【００６８】
ＳＩＲ選択部３１１は、ＴＰＣ生成方法信号が合成値基準のＴＰＣコマンド生成方法を示す場合、受信ＳＩＲの合成値をＴＰＣコマンド生成部３１２に出力する。一方、ＳＩＲ選択部３１１は、ＴＰＣ生成方法信号がプライマリ基準のＴＰＣコマンド生成方法を示す場合、プライマリ基地局装置から送信された信号の受信ＳＩＲのみをＴＰＣコマンド生成部３１２に出力する。
【００６９】
ＴＰＣコマンド生成部３１２は、ＳＩＲ選択部３１１から出力された受信ＳＩＲと目標ＳＩＲとの大小関係によりＤＬ用ＴＰＣコマンドを生成し、多重部３５４に出力する。
【００７０】
ＣＩＲ測定部３１３は、プライマリ基地局装置からの共通制御チャネルの信号を用いてＣＩＲを測定し、測定結果をＣＱＩ生成部３１４に出力する。ＣＱＩ生成部３１４は、プライマリ基地局装置から送信された信号のＣＩＲに基づくＣＱＩ信号を生成して多重部３５１に出力する。
【００７１】
受信電力測定部３１５は、プライマリ基地局装置以外の周辺基地局装置からの共通制御チャネルの受信電力を示す受信電力を測定して、受信電力信号を多重部３５１に出力する。
【００７２】
多重部３５１は、ＣＱＩ信号、受信電力信号及びＡＣＫ／ＮＡＣＫ信号を多重して変調部３５２に出力する。変調部３５２は、多重部３５１の出力信号に対して誤り訂正符号化、変調及び拡散を行って多重部３５６に出力する。
【００７３】
変調部３５３は、基地局装置２００に送信するデータに対して誤り訂正符号化、変調及び拡散を行って多重部３５６に出力する。
【００７４】
多重部３５４は、ＤＬ用ＴＰＣコマンド、パイロット信号を多重して変調部３５５に出力する。変調部３５５は、多重部３５４の出力信号に対して誤り訂正符号化、変調及び拡散を行って多重部３５６に出力する。
【００７５】
多重部３５６は、変調部３５２、変調部３５３及び変調部３５５の各出力信号を多重し、送信ＲＦ部３５８に出力する。
【００７６】
送信電力制御部３５７は、ＵＬ用ＴＰＣコマンドに従って送信ＲＦ部３５８の増幅量を制御することにより、多重部３５６の出力信号の送信電力を制御する。なお、複数の基地局装置と接続している場合、送信電力制御部３５７は、全てのＵＬ用ＴＰＣコマンドが送信電力の上昇を指示する場合のみ送信電力を上昇させる制御を行う。
【００７７】
送信ＲＦ部３５８は、多重部３５６から出力されたベースバンドのディジタル信号を増幅し、無線周波数の信号に変換して共用器３０２に出力する。
【００７８】
次に、本実施の形態に係るハンドオーバ時のＴＰＣコマンド生成方法について、図５及び図６を用いて詳細に説明する。図５は通信端末装置がＨＳＤＰＡサービスを受けない場合を示し、図６は通信端末装置がＨＳＤＰＡサービスを受ける場合を示す。なお、図５及び図６において、合成値基準を示すＴＰＣ生成方法信号を「０」、プライマリ基準を示すＴＰＣ生成方法信号を「１」とする。
【００７９】

図５（ａ）～（ｃ）に示すように、通常、制御局装置５０１は、ＨＳＤＰＡサービスを受けない通信端末装置に対して、常に合成値基準を示すＴＰＣ生成方法を指示する。

【００８０】

図５（ａ）は、通信端末装置５０４が、基地局装置５０２と無線通信を行っている状態を示している。この場合、制御局装置５０１は基地局装置５０２に信号「０」を出力し、基地局装置５０２はＤＰＣＨで信号「０」を通信端末装置５０４に送信する。この結果、通信端末装置５０４は、基地局装置５０２のＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの大小関係によりＤＬ用ＴＰＣコマンドを作成する。

【００８１】

その後、図５（ｂ）に示すように、通信端末装置５０４が、基地局装置５０２のセルと基地局装置５０３のセルとが重なる部分に移動し、ＨＯ状態になったとする。この場合、制御局装置５０１は基地局装置５０２及び基地局装置５０３に信号「０」を出力し、基地局装置５０２及び基地局装置５０３はそれぞれＤＰＣＨで信号「０」を通信端末装置５０４に送信する。この結果、通信端末装置５０４は、基地局装置５０２及び基地局装置５０３のＤＰＣＨの受信ＳＩＲの合成値と目標ＳＩＲとの大小関係によりＤＬ用ＴＰＣコマンドを作成する。

【００８２】

その後、図５（ｃ）に示すように、通信端末装置５０４が、基地局装置５０３のセルに移動し、ＨＯではない状態になったとする。この場合、制御局装置５０１は基地局装置５０３に信号「０」を出力し、基地局装置５０３はＤＰＣＨで信号「０」を通信端末装置５０４に送信する。この結果、通信端末装置５０４は、基地局装置５０３のＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの大小関係によりＤＬ用ＴＰＣコマンドを作成する。

【００８３】

図６（ａ）は、通信端末装置６０４が、基地局装置６０２と無線通信を行い、ＨＳＤＰＡサービスを受けている状態を示している。この場合、図５（ａ）と同様に、制御局装置６０１は基地局装置６０２に信号「０」を出力し、基地局装置６０２はＡ－ＤＰＣＨで信号「０」を通信端末装置６０４に送信する。この結果、通信端末装置６０４は、基地局装置６０２のＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの大小関係によりＤＬ用ＴＰＣコマンドを作成する。

【００８４】

その後、図６（ｂ）、（ｃ）に示すように、通信端末装置６０４が、基地局装置６０２のセルと基地局装置６０３のセルとが重なる部分に移動し、ＨＯ状態になったとする。この場合、制御局装置６０１は基地局装置６０２及び基地局装置６０３に信号「１」を出力し、基地局装置６０２及び基地局装置６０３はそれぞれＡ－ＤＰＣＨで信号「１」を通信端末装置６０４に送信する。この結果、通信端末装置６０４は、プライマリ基地局装置となる基地局装置６０２あるいは基地局装置６０３のいずれかのＡ－ＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの大小関係によりＤＬ用ＴＰＣコマンドを作成する。なお、図６（ｂ）はプライマリ基地局装置が基地局装置６０２である場合を示し、図６（ｃ）はプライマリ基地局装置が基地局装置６０３である場合を示す。

【００８５】

その後、図６（ｄ）に示すように、通信端末装置６０４が、基地局装置６０３のセルに移動し、ＨＯではない状態になったとする。この場合、図５（ｃ）と同様に、制御局装置６０１は基地局装置６０３に信号「０」を出力し、基地局装置６０３はＡ－ＤＰＣＨで信号「０」を通信端末装置６０４に送信する。この結果、通信端末装置６０４は、基地局装置６０３のＤＰＣＨの受信ＳＩＲと目標ＳＩＲとの大小関係によりＤＬ用ＴＰＣコマンドを作成する。

【００８６】

なお、本実施の形態では、制御局装置が、ＨＳＤＰＡサービスを受ける通信端末装置がＨＯ状態にあるか否かを判断し、ＨＯ状態にある通信端末装置に対してプライマリ基準を示すＴＰＣ生成方法信号を送信する場合について説明したが、本発明では、制御局装置が、

ＨＳＤＰＡサービスを受ける通信端末装置に対して、常にプライマリ基準を示すＴＰＣ生成方法信号を送信してもよい。

【００８７】

このように、ＨＳＤＰＡサービスを受ける通信端末装置において、少なくともＨＯ状態である場合には、プライマリ基地局装置のＡ－ＤＰＣＨの受信ＳＩＲが目標ＳＩＲとなるようにＴＰＣコマンドを生成することにより、プライマリ基地局装置においてＨＳ－ＳＣＣＨの送信電力をＡ－ＤＰＣＨの送信電力に所定のオフセット値を加えて設定すれば、常に、ＨＳ－ＳＣＣＨの受信電力を所要のＳＩＲとすることができるので、ＨＳＤＰＡサービスを行う無線通信システムにおいてシステムスループットの向上を図ることができる。

【００８８】

（実施の形態２）

実施の形態１において、ＨＳＤＰＡサービスを受ける通信端末装置がＨＯ状態の場合、プライマリ基地局装置以外の基地局装置からもＡ－ＤＰＣＨの信号が送信される。そして、通信端末装置は、プライマリ基地局装置のＡ－ＤＰＣＨの受信ＳＩＲが目標ＳＩＲとなるようにＴＰＣコマンドを生成する。したがって、プライマリ基地局装置以外の基地局装置から送信されるＡ－ＤＰＣＨの信号は、当該通信端末装置において過剰品質となり、他の通信端末装置にとっては与干渉となる。ゆえに、プライマリ基地局装置以外の基地局装置から送信されるＡ－ＤＰＣＨの送信電力を、ＴＰＣコマンドによらずに制御しなければ、システム容量が減少してしまう。実施の形態２は、この点に鑑みてなされたものである。

【００８９】

図７は、本発明の実施の形態２に係る制御局装置の構成を示すブロック図である。なお、図７に示す制御局装置７００において、図２に示した制御局装置１００と共通する構成部分には、図２と同一符号を付して説明を省略する。

【００９０】

図７に示す制御局装置７００は、図２の制御局装置１００に対してプライマリ選択部７０１を追加した構成を採る。

【００９１】

プライマリ選択部７０１は、ＨＯ端末信号を参照して、プライマリ基地局装置を示す信号（以下、「プライマリ信号」という）を生成する。

【００９２】

多重部１０７は、信号処理部１０６の出力信号にプライマリ信号を含むパケット伝送用制御信号及びオフセット信号等を多重して基地局装置２００に出力する。

【００９３】

図８は、本発明の実施の形態２に係る基地局装置の構成を示すブロック図である。なお、図８に示す基地局装置８００において、図３に示した基地局装置２００と共通する構成部分には、図３と同一符号を付して説明を省略する。

【００９４】

図８に示す基地局装置８００は、スケジューラ８０１及び送信電力制御部８０２の作用が、図３のスケジューラ２５１及び送信電力制御部２５８と異なる。

【００９５】

スケジューラ８０１は、図３に示したスケジューラ２５１の作用に加えて、プライマリ信号に基づいて自局が各通信端末装置に対してプライマリ基地局装置であるか否かを判定し、判定結果を送信電力制御部８０２に出力する。

【００９６】

送信電力制御部８０２は、自局がプライマリ基地局装置である場合には、ＤＬ用ＴＰＣコマンドに従って増幅部２５９の増幅量を制御する。

【００９７】

一方、自局がプライマリ基地局装置でない場合には、ＤＬ用ＴＰＣコマンドによらずに増幅部２５９の増幅量を制御する。例えば、送信電力を変化させないために、送信電力増加および減少を交互に繰り返す制御を行う。あるいは、他移動局への干渉を低減するために

、送信電力を徐々に減少させる制御を行う。

【００９８】

このように、ＨＯ状態において、プライマリ基地局装置以外の基地局装置のＡ－ＤＰＣＨの送信電力をＴＰＣコマンドによらずに制御することにより、Ａ－ＤＰＣＨの送信電力の過剰な増加を抑えて、システム容量の減少を防止することができる。

【００９９】

（実施の形態３）

実施の形態３は、実施の形態２と同様にＡ－ＤＰＣＨの送信電力を抑えて、システム容量の減少を防止することを目的とし、実施の形態２とは異なる方法で実現するものである。具体的には、プライマリ基地局装置が、ＨＳＤＰＡサービスを受ける通信端末装置に対して、ＨＳ－ＰＤＳＣＨにて信号を送信する場合にはプライマリ基準のＴＰＣコマンド生成方法を、他の場合には合成値基準のＴＰＣコマンド生成方法を選択するように指示することである。これは、パケットデータは間欠的に送信され、パケットデータを送信しない時間においてはＨＳ－ＳＣＣＨの送信電力を制御する必要がなく、プライマリ基地局装置のＡ－ＤＰＣＨの送信電力を低くしても問題が生じないことによるものである。

【０１００】

図９は、本発明の実施の形態３に係る基地局装置の構成を示すブロック図である。なお、図９に示す基地局装置９００において、図８に示した基地局装置８００と共通する構成部分には、図８と同一符号を付して説明を省略する。

【０１０１】

図９に示す基地局装置９００は、図８に示した基地局装置に対して切替制御部９０１及び補正値設定部９０２を追加した構成を採る。

【０１０２】

切替制御部９０１は、各通信端末装置のパケットデータがバッファ２５２に蓄積されているか否かを監視し、監視結果に基づいてＴＰＣコマンド生成方法の切り替えを指示する信号（以下、「切替信号」という）を多重部２５６に出力する。具体的には、切替制御部９０１は、バッファ２５２にパケットデータが蓄積されている場合にはプライマリ基準のＴＰＣコマンド生成方法に切り替える旨を指示する切替信号を出力し、バッファ２５２にパケットデータが蓄積されていない場合には合成値基準のＴＰＣコマンド生成方法に切り替える旨を指示する切替信号を出力する。

【０１０３】

多重部２５６は、無線通信を行う通信端末装置の数だけ用意され、各通信端末装置に送信する個別データにパイロット信号及びＵＬ用ＴＰＣコマンド、切替信号を多重して変調部２５７に出力する。

【０１０４】

ＨＳＤＰＡサービスでないときは、ＴＰＣコマンド生成方法信号及び切替信号が不要であるので、図１０（ａ）のＡ－ＤＰＣＨのフレームフォーマットに示すように、各スロットにパイロット信号（ＰＬ）、ＵＬ用ＴＰＣコマンド（ＴＰＣ）及びデータ（ｄａｔａ1、ｄａｔａ2）が配置されるフレーム構成となる。

【０１０５】

一方、ＨＳＤＰＡサービスの際には、ＴＰＣコマンド生成方法信号及び切替信号を送信する必要がある。そこで、図１０（ｂ）のＡ－ＤＰＣＨのフレームフォーマットに示すように、データ部の一部をパンクチャリングしてＴＰＣコマンド生成方法信号及び切替信号を多重するフレーム構成をとることにする。

【０１０６】

通信端末装置は、ＨＳＤＰＡサービスを受けているか否かで、どちらのフレーム構成かを判断することが可能であり、ＨＳＤＰＡサービスを受けている場合には、上記パンクチャドにより多重された切替信号を見て、ＴＰＣコマンド生成方法を切替える。なお、ＨＳＤＰＡサービスを受けていない場合は、従来どおりデータ部として復調する。

【０１０７】

これにより、従来どおりの基本的なフレーム構成案を踏襲したままで切替信号の伝送が可能になり、信号伝送の効率化を図ることができる。

【０１０８】

補正値設定部９０２は、再送状態及びＡＣＫ／ＮＡＣＫ信号に基づいてＨＳ－ＳＣＣＨの送信電力の補正値を設定し、送信電力制御部２６０に出力する。

【０１０９】

送信電力制御部２６０は、再送時に、補正値設定部９０２からの補正値を加えることにより、ＨＳ－ＳＣＣＨの送信電力を初回送信に比べて高く設定することが考えられる。また、ある通信端末装置あてにＨＳ－ＳＣＣＨを送信したにも関わらず、ＡＣＫ／ＮＡＣＫ信号が受信できずに、再送状態になった場合には、ＨＳ－ＳＣＣＨが正しく受信できない可能性が高いと判断し、その場合にのみ、再送時のＨＳ－ＳＣＣＨの送信電力を初回送信に比べて高く設定する。さらに、再送回数が増えるほど補正値を高く設定する。これらにより、ＨＳ－ＳＣＣＨが正しく受信できないことによって発生する再送回数を低減することが可能になる。

【０１１０】

さらに、送信電力制御部２６０は、設定した送信電力に補正値設定部９０２から入力した補正値を加算することによりアウターループ制御を行う。送信電力制御部２６０が、送信電力をアウターループ制御することにより、再送時だけでなく初回送信も含めたＨＳ－ＳＣＣＨの送信電力を補正することが可能になり、再送回数を減らしてスループットの向上を図ることができる。

【０１１１】

ただし、補正値設定部９０２は、再送情報だけでは、通信端末装置においてＨＳ－ＳＣＣＨを正しく受信することができたにも関わらず、パケットデータであるＨＳ－ＰＤＳＣＨを正しく受信することができなかったため、ＮＡＣＫ信号により再送になったのか、または、ＨＳ－ＳＣＣＨを正しく受信することができなかったために、ＨＳ－ＰＤＳＣＨも受信することができずに再送になったかを見分けることはできない。よって、初回の送信電力も含めたＨＳ－ＳＣＣＨの送信電力に関するアウターループ制御には、再送情報だけでは不十分である。例えば、ある端末あてにＨＳ－ＳＣＣＨを送信したにも関わらず、ＡＣＫ／ＮＡＣＫ信号が受信できずに、再送状態になった場合には、その端末がＨＳ－ＳＣＣＨを正しく受信できないために発生した可能性が高いと判断される。よって、その発生頻度が高い場合は、補正値設定部９０２は、ＣＱＩ信号の内容（報告値）から設定するＨＳ－ＳＣＣＨの送信電力をそれまでよりも高い補正値に設定する。これにより、初回の送信電力も含めたＨＳ－ＳＣＣＨの送信電力に関するアウターループ制御が可能になる。また、補正値設定部９０２は、再送回数が増えるほど補正値を高く設定する。

【０１１２】

なお、アウターループ制御として、通信端末装置毎に行う方法と全体で一括して行う方法の２通りが考えられる。通信端末装置毎に行う方法では、各通信端末装置での回線状態（マルチパス状態や移動速度など）に応じた制御ができるため、各端末とのスループットの向上を最大限に図ることができる。一方、全体で一括して行う方法の場合には、基地局装置の設置場所などに固有な回線条件（マルチパス数など）による補正が可能であり、さらに通信端末装置毎に行う方法に比べてアウターループ制御に必要な処理量の削減を図ることができる。

【０１１３】

次に、送信電力制御部２６０におけるアウターループ制御の送信電力の算出方法について具体的に説明する。

【０１１４】

送信電力制御部２６１は、以下の式（１）によりＨＳ－ＳＣＣＨの送信電力を算出する。

$$P_{HS-SCCH} = P_{A-DPCH} + \text{offset value} + (\text{adjustment value 1}) + (\text{adjustment value 2}) \cdots (1)$$

ただし、式（１）において、
$P_{HS-SCCH}$　：ＨＳ－ＳＣＣＨの送信電力
P_{A-DPCH}　：　各端末のＡ－ＤＰＣＨの送信電力
ｏｆｆｓｅｔ　ｖａｌｕｅ：　上位装置より指定されたＡ－ＤＰＣＨの送信電力に対するオフセット値
ａｄｊｕｓｔｍｅｎｔ　ｖａｌｕｅ１：　アウターループ制御により補正された値（ユーザごとの補正または全体での補正の２通りがある。）
ａｄｊｕｓｔｍｅｎｔ　ｖａｌｕｅ　２：　再送制御により補正された値
【０１１５】
なお、P_{A-DPCH}が１スロット毎に変化するため、$P_{HS-SCCH}$も１スロット毎に変化する。
【０１１６】
図１１は、本発明の実施の形態３に係る通信端末装置の構成を示すブロック図である。なお、図１１に示す通信端末装置１１００において、図４に示した通信端末装置４００と共通する構成部分には、図４と同一符号を付して説明を省略する。
【０１１７】
図１１に示す通信端末装置１１００は、ＳＩＲ選択部１１０１の作用が、図４のＳＩＲ選択部３１１と異なる。
【０１１８】
分離部３０９にて分離された制御信号には、ＵＬ用ＴＰＣコマンド、ＴＰＣ生成方法信号、切替信号等が含まれる。ＵＬ用ＴＰＣコマンドは送信電力制御部３５７に出力され、ＴＰＣ生成方法信号及び切替信号はＳＩＲ選択部１１０１に出力される。
【０１１９】
ＳＩＲ選択部１１０１は、ＴＰＣ生成方法信号が合成値基準のＴＰＣコマンド生成方法を示す場合、受信ＳＩＲの合成値をＴＰＣコマンド生成部３１２に出力する。一方、ＳＩＲ選択部１１０１は、ＴＰＣ生成方法信号がプライマリ基準のＴＰＣコマンド生成方法を示す場合、切替信号の内容を判断する。その結果、切替信号が、合成値基準のＴＰＣコマンド生成方法を示す場合、受信ＳＩＲの合成値をＴＰＣコマンド生成部３１２に出力し、プライマリ基準のＴＰＣコマンド生成方法を示す場合、プライマリ基地局装置から送信された信号の受信ＳＩＲのみをＴＰＣコマンド生成部３１２に出力する。
【０１２０】
このように、プライマリ基地局装置が、ＨＳＤＰＡサービスを受ける通信端末装置に対して、ＨＳ－ＰＤＳＣＨで信号を送信しない場合には合成値基準のＴＰＣコマンド生成方法を選択することを指示することにより、ＨＳ－ＰＤＳＣＨにて信号を送信しない時間においてＡ－ＤＰＣＨの送信電力を抑えることができ、システム容量またはシステムスループットの減少を防止することができる。
【０１２１】
なお、上記の説明では、便宜上、Ｗ－ＣＤＭＡシステムに使用されるチャネルの名称を使用しているが、本発明は、Ｗ－ＣＤＭＡシステムに限らず、下り回線でパケット伝送を行う他システムにも適用することができる。さらに，本発明は上記のチャネルに限らず、一般にＳＨＯを適用するチャネルとＨＨＯを適用するチャネルが混在する場合に、ＳＨＯを適用するチャネルのＴＰＣコマンド生成方法を切り替えるよう適用可能である。
【０１２２】
【発明の効果】
以上説明したように、本発明によれば、常に、ＨＳ－ＳＣＣＨの受信電力を所要のＳＩＲとすることができるので、ＨＳＤＰＡサービスを行う無線通信システムにおいてシステムスループットの向上を図ることができる。

transmission power control information from a base station obtained at a mobile station and the propagation loss of the radio wave propagation path between each base station and a mobile station. When a reception signal quality is decided to have been lowered than a predetermined quality, an autonomous control procedure functions so that the transmission power is increased according to a predetermined characteristic independently of transmission power control information from another communication apparatus. After synchronization is established in a mobile station for a signal from a base station, the transmission power is controlled from the initial value according to a predetermined characteristic independently of the transmission power control information from the base station.

(57) 要約:

本発明は、移動局と各基地局との間の電波伝送路での伝搬損失を演算する伝搬損失演算手段と、移動局にて得られる各基地局からの送信電力制御情報と、上記伝搬損失演算手段にて演算された各基地局と移動局との間の電波伝送路の伝搬損失とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定し、受信信号品質が所定の品質より低下したと判定されたときには、送信電力を、他の通信装置からの送信電力制御情報にかかわらず、当該判定時の送信電力値から所定の特性に従って上昇させる自律制御手順を有し、基地局からの信号に対する移動局での同期が確立された後に、基地局からの送信電力制御情報に係わらず、送信電力を、初期値から所定の特性に従って上昇させるように制御することである。

明　細　書

移動通信システムにおける送信電力制御装置及び方法並びに移動局及び通信装置

技術分野

本発明は、移動通信システムにおける送信電力制御装置及び方法並びに移動局及び通信装置に係り、詳しくは、移動通信システムにおける複数の基地局と無線通信を行う移動局の送信電力制御を行う送信電力制御装置及び方法並びに移動局及び通信装置、あるいは、他の通信装置と信号の無線送受信を行い、受信信号品質に基づいて決定した上記他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信する通信装置での送信電力を制御する送信電力制御方法及び装置に関する。

背景技術

従来、例えば、特開平 9-312609 には、ＣＤＭＡ方式の移動通信システムにおいて、移動局が複数の基地局と無線通信を行ってソフトハンドオーバを行う際の送信電力制御方法が開示されている。

この送信電力制御方法では、ソフトハンドオーバに際して、移動局からの信号を受信する２つの基地局のそれぞれは、受信信号に対して希望波対干渉波及び雑音電力比（以下、受信ＳＩＲ（SIR：Signal to Interference plus noise power Ratio）という）を測定し、その受信ＳＩＲが目標ＳＩＲに近づくように送信電力制御ビット（電力増加または電力減少を表す）を生成する。そして、その生成された送信電力制御ビットが各基地局から移動局に伝送される。移動局は、当該２つの基地局のそれぞれからの信号に対する受信ＳＩＲを測定し、その各基地局の受信ＳＩＲを対応する基地局からの送信電力制御ビットの信頼度として考慮しつつ、各基地局からの送信電力制御ビットに基づいて送信電力制御（電力増加、電力減少または電力維持）を行う。

具体的には、一方の基地局の受信ＳＩＲが所定の基準値以下である場合には、その基地局からの送信電力制御ビットは信頼度が低いとして無視され、他方の基

地局からの送信電力ビットに基づいて送信電力制御（電力増加または電力減少）がなされる。また、双方の基地局の受信ＳＩＲが所定の基準値以下である場合には、双方の基地局からの送信電力制御ビットの信頼度が低いものとして、それらの送信電力制御ビットにかかわらず、現在の送信電力が維持される。更に、双方の基地局の受信ＳＩＲが所定の基準値より大きくなる場合、送信電力がより小さくなるように選択された送信電力制御ビット（電力減少を表す）に基づいて送信電力制御がなされる。

このような移動局での送信電力制御によれば、各基地局から受信される複数の送信電力制御ビットのうちより信頼性の高い送信電力制御ビットに基づいてより送信電力が小さくなるように移動局での送信電力制御がなされるので、安定した通信品質を維持しつつ無駄のない送信電力制御が可能となる。

なお、移動局は、複数の基地局について上記のように測定した各受信ＳＩＲを最大比合成し、その合成にて得られたＳＩＲに基づいて送信電力制御ビットを生成する。そして、その生成された送信電力制御ビットが移動局から各基地局に伝送され、各基地局は、移動局から受信される送信電力制御ビットに基づいて送信電力制御を行う。

上述した移動通信システムにおける移動局での送信電力制御では、各基地局についての受信ＳＩＲを対応する基地局からの送信電力制御ビットの信頼度として扱っている。しかし、その受信ＳＩＲは、移動局での信号受信品質（上記合成ＳＩＲ）があるレベルになるように各基地局にて送信電力制御がなされつつ送信された信号に基づいて当該移動局にて測定されるため、常に移動局と各基地局との間の電波伝送路の状態（フェージングの状態、距離など）を忠実に反映したものになっているとは限らない。ソフトハンドオーバに際しては移動する移動局と各基地局との間の電波伝送路の状態（特に、距離）が時々刻々と変化するため、そのような電波伝送路の状態をより忠実に考慮しつつ移動局の送信電力制御を行うことが所望の通信品質を満たしながら移動局の送信電力を低減させるうえで好ましい。

また、従来、ＣＤＭＡ方式の移動通信システムにおいて相互に信号の無線送受信を行う移動局と基地局のそれぞれは、次のようにして送信電力制御を行ってい

る。

移動局は、基地局からの受信信号に対する希望波対干渉波及び雑音電力比（以下、受信ＳＩＲ（Signal to Interference plus noise power ratio）を受信信号品質として測定し、その受信ＳＩＲと目標ＳＩＲとの差に基づいて送信電力制御ビット（電力増加または送信電力減少を表す）を生成する。そして、移動局は、その送信電力制御ビット（送信電力制御情報）を基地局に送信する。

基地局は、移動局からの送信電力制御ビットに基づいて送信電力を制御する一方、移動局からの受信信号に対する受信ＳＩＲを測定し、その受信ＳＩＲと目標ＳＩＲとの差に基づいて送信電力制御ビットを生成する。そして、基地局は、その送信電力制御ビットを移動局に送信する。

移動局は、上述したように基地局に送信すべき送信電力制御ビットを生成すると共に、基地局からの送信電力制御ビットに基づいて自局における送信電力を制御する。

上記のような移動局及び基地局での送信電力制御により、移動局では、基地局での受信ＳＩＲが目標ＳＩＲに近づくように送信電力の制御がなされる。また、基地局でも、同様に、移動局での受信ＳＩＲが目標ＳＩＲに近づくように送信電力制御がなされる。このような送信電力制御により、移動局と基地局との間の電波伝送路の状態（距離、フェージングの状態等）が変動しても、移動局及び基地局は、受信信号品質が安定した状態で無駄のない送信電力にて信号の送受信を行うことが可能となる。

移動局及び基地局において上述した送信電力制御が正常になされている場合、移動局及び基地局では、例えば、図２０の正常で示す領域のように、受信ＳＩＲが目標ＳＩＲを挟む比較的狭い範囲を推移するようになる。しかし、上述したような送信電力制御を行っていても、例えば、図２０の異常で示す領域のように、受信ＳＩＲが目標ＳＩＲに近づくことなく順次低下してしまうことがある。このような現象は、次のような理由に基づくものであると考えられる。

移動局での受信ＳＩＲが上記のように低下してしまう場合を例にすると、これは、移動局にて生成された送信電力制御ビットに基づいた基地局での送信電力制御が正常になされていないことである。その理由の一つとして、移動局から上り

リンクで伝送される送信電力制御ビットの基地局での受信品質が十分ではなく、移動局で生成された送信電力制御ビットの値と異なった値にて基地局での送信電力制御がなされていることが考えられる。このような状況は、移動局から送信電力制御ビットを送信する際の送信電力制御がその送信電力制御ビットの基地局での受信品質を所定レベルに維持できるように必ずしもなされていないことによるものである。

即ち、上記のような状況では、移動局での受信ＳＩＲの低下に起因して基地局からの送信電力制御ビットの移動局での受信品質が低下して当該移動局での送信電力制御が正常に行なわれなくなり、その正常でない送信電力制御に起因して移動局からの送信電力制御ビットの基地局での受信品質が低下してしまう。そして、更に、その基地局での送信電力制御ビットの受信品質の低下により基地局での送信電力制御が正常に行なわれなくなって、移動局での受信ＳＩＲが益々低下してしまう。このような状況が続くと、移動局と基地局との間の通信が切断される事態に至ってしまうおそれがある。

また、従来、ＣＤＭＡ方式の移動通信システムにおいて、基地局と移動局との間で情報データの伝送を開始する前に、基地局と移動局は、共通制御チャネルを用いて種々の情報（使用する固有拡散符号に関する情報、個別チャネルの信号フォーマットに関する情報等）の送受信を行い、その後、上記各種の情報に基づいて決められた個別チャネルを用いて所定フォーマットによる信号の送受信を行って、双方の局での信号同期をとるようにしている。その同期をとるための処理は、例えば、図２１に示す手順に従って行われる。

図２１において、基地局２００が所定フォーマットによる信号の送信（下り送信）を開始する（①）。この下り送信される信号は、所定のパターンとなる送信電力制御ビット（電力増加または電力減少を表す送信電力制御情報）が含まれる。移動局１００は、受信される基地局２００からの信号の同期引き込み処理を行う（②）。この同期引き込みの処理により同期が確立（下り同期確立）したことが判定されると（③）、移動局１００は、受信される上記所定パターンの送信電力制御ビットに従って送信電力制御を行いつつ所定フォーマットによる信号の送信（上り送信）を開始する（④）。

基地局２００は、受信される移動局１００からの信号の同期引き込み処理を行う（⑤）。この同期引き込み処理により、当該基地局２００での同期が確立される（上り同期確立）（⑥）。基地局２００が信号の送信を開始（①）してから当該基地局２００での上り同期確立（⑥）がなされるまで、有限の時間を要する。

上述したような同期をとるための処理の過程で、移動局１００の送信電力制御は、例えば、図２２に示すようになされる。

基地局２００は、当初、移動局１００からの信号を受信していない状態で、下り送信を開始しなければならないので（図２１の①参照）、例えば、常に電力増加を表すパターン（例えば、全て「１」のパターン）の送信電力制御ビットを当該信号と共に送信する。移動局１００は、下り同期確立（図２１における③）の判定を行った後に、図２２に示すように、上り送信開始（図２１における④）の時刻ｔ1 から、送信電力を上記のような送信電力制御ビット（1,1,1,1,…）に従って、例えば、伝搬損失等に基づいて決められた初期値Ｐ0から順次上昇させる。

上記送信電力制御ビットに従った送信電力制御周期は、上記移動局１００と基地局２００にて同期確立がなされるまでに要する時間より非常に短い。そのため、上記送信電力制御ビットに従った送信電力制御により、送信電力値が上昇して最大値Ｐmax に達すると、送信電力がその最大値Ｐmax に維持される。

このようにして移動局１００が最大値Ｐmax となるように送信電力制御を行いつつ信号を送信する過程で、その信号の基地局２００での同期引き込みにより上り同期が確立すると（時刻ｔ2）、それ以後、基地局２００は、移動局１００からの信号に対する希望波対干渉波及び雑音電力比（以下、受信ＳＩＲ（Signal to Interference plus noise power ratio）という）を受信信号品質として測定し、その受信ＳＩＲと別に定められた目標ＳＩＲとの差に基づいて送信電力制御ビット（電力増加または電力減少を表す）を生成する。そして、基地局２００は、そのように生成された送信電力制御ビットを移動局１００に送信（下り送信）する。

上記のように基地局２００での上り同期が確立した時点（時刻ｔ2）では、移動局１００は最大値Ｐmax となるように送信電力制御を行っているので、当該移動局１００からの受信ＳＩＲは目標ＳＩＲより非常に大きな値となっており（過剰品質）、その上り同期が確立した直後においては、通常、連続的に電力減少を

表す送信電力制御ビット（例えば、「０」）が生成される。

上記のように基地局２００での上り同期確立がなされた以後（時刻ｔ2 以後）、移動局１００は、上記のようにして基地局２００にて生成される送信電力制御ビットに基づいて送信電力制御（閉ループ制御）を行いつつ信号の送信を行う（上り送信）。その結果、移動局１００の送信電力は、基地局２００での受信ＳＩＲが目標ＳＩＲに維持され得る適正な値に制御される。このような状態において、所定のタイミングにて、移動局１００は、情報データを含めた信号を開始する。

上記のような基地局２００と移動局１００との間で情報データの伝送を開始する前における移動局１００での送信電力制御方法では、基地局２００からの信号の移動局１００での下り同期が確立した後（図２２における時刻ｔ1 後）において、移動局１００は、基地局２００からの連続的に電力増加を表す送信電力制御ビット（1,1,1,1,…）に基づいて送信電力を急速に上昇させるように制御しつつ信号の送信を行う。このような送信電力制御により、基地局２００における移動局１００からの信号の受信品質が急速に向上する。このため、基地局２００での下り同期確立をより早期に実現することができるようになる。

しかし、基地局２００と移動局１００との信号の送受信において、移動局１００での送信電力は、基地局２００での受信信号品質（例えば、受信ＳＩＲ）が目標品質（例えば、目標ＳＩＲ）に維持されるものであれば十分である（図２２における時刻ｔ2 以降の送信電力値参照)。このように基地局２００での受信信号品質が目標品質に維持されるように移動局１００での送信電力を制御すれば足りるにもかかわらず、前述したように、移動局１００での送信電力を最大値Ｐmax に制御したり、その最大値Ｐmax に近い値に制御すると、基地局２００と移動局１００との間で情報データの伝送が開始される直前において移動局１００の送信電力が一時的に過剰な値になり、上り回線における無駄な電力消費がなされると共に、基地局２００にて無線リソースが無駄に費やされてしまう。

発明の開示

そこで、本発明の第一の課題は、移動局が複数の基地局と無線通信を行うに際

して、移動局と各基地局との間の電波伝送路の状態をより忠実に考慮して移動局の送信電力制御を可能にする送信電力制御装置を提供することである。そして、本発明の第二の課題は、そのような送信電力制御装置にて送信電力制御のなされる移動局を提供することである。

また、本発明の第三の課題は、他の通信装置と信号の無線送受信を行い、受信信号品質に基づいて決定した上記他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信する通信装置において上記受信信号品質が連続して所定の品質より低下することを防止できるようにした送信電力制御方法及び装置を提供することである。本発明の第四の課題は、そのような送信電力制御装置を備えた通信装置を提供することである。

更に、本発明の第五の課題は、移動局と基地局との間で情報データの伝送が開始される前に、できるだけ早期に同期確立がなされると共に、より無駄のない移動局での送信電力となるように制御が可能な送信電力制御方法及び装置を提供することである。本発明の第六の課題は、そのような送信電力制御方法に従って送信電力の制御がなされる移動局を提供することである。

上記第一の課題を解決するため、本発明は、請求項１に記載されるように、移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御装置において、各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の電波伝送路での伝搬損失を演算する伝搬損失演算手段と、移動局にて得られる各基地局からの送信電力制御情報と、上記伝搬損失演算手段にて演算された各基地局と移動局との間の電波伝送路の伝搬損失とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手段とを有するように構成される。

このような送信電力制御装置では、移動局と各基地局との間の電波伝送路の伝搬損失を演算する際の基礎となる各基地局からの所定の信号が固定的な送信電力にて送信されるので、その演算される伝搬損失は、対応する移動局と基地局との間の電波伝送路の状態（距離、フェージング状態など）をより忠実に表す。そし

て、このような各基地局と移動局との間の電波伝送路の伝搬損失と、移動局にて得られる各基地局からの送信電力制御情報とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報が決定される。

送信電力制御情報を決定する際に、各基地局と移動局との間の電波伝送路の状態を、各状態に応じた重みを付けて考慮するという観点から、本発明は、請求項２に記載されるように、上記送信電力制御装置において、上記送信電力制御情報決定手段は、移動局との間の電波伝送路の伝搬損失がより小さい基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した重み付け補正情報を合成して合成送信電力制御情報を生成する合成手段とを有し、該合成手段にて得られた合成送信電力制御情報に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するように構成することができる。

上記各基地局から送信される送信電力制御情報は、電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報であると共に、移動局が各基地局からの送信電力制御情報を軟判定値として取得する場合、上記送信電力制御情報決定手段は、請求項３に記載されるように、上記合成手段にて得られた合成送信電力制御情報の値を所定の閾値を用いて硬判定する硬判定手段を有し、その硬判定結果に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するように構成することができる。

また、できるだけ無駄のない送信電力制御が可能となるという観点から、本発明は、請求項４に記載されるように、上記送信電力制御装置において、上記硬判定手段にて用いられる上記所定の閾値は、各基地局から送信される送信電力制御情報が取り得る第一の値と第二の値との中間値より所定量だけ第一の値寄りの値となるように構成することができる。

このような送信電力制御装置では、上記所定の閾値が所定量だけ電力増加の制御状態を表す第一の値寄りになっているので、合成送信電力制御情報の値は、その閾値を用いた硬判定により、電力増加の制御状態でないと判定され易くなる。

その結果、より低電力での送信電力制御が可能となる。

上記各基地局から送信される送信電力制御情報は、電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報であると共に、移動局が各基地局からの送信電力制御情報を軟判定値として取得する場合、より細かい送信電力制御が可能となるという観点から、上記送信電力制御情報決定手段は、請求項５に記載されるように、上記合成手段にて得られた合成送信電力情報の値を第一の閾値を用いて硬判定する第一の硬判定手段と、上記合成送信電力制御情報の値を上記第一の閾値と異なる第二の閾値を用いて硬判定する第二の硬判定手段と、上記第一の硬判定手段での判定結果及び上記第二の硬判定手段での判定結果に基づいて、電力増加の制御状態を表す第一の制御情報、電力減少の制御状態を表す第二の制御情報及び電力維持の制御状態を表す第三の制御情報のいずれかを生成する制御情報生成手段とを有し、該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するように構成することができる。

このような送信電力制御装置では、合成送信電力制御情報の値は、第一及び第二の閾値の双方より大きくなる場合、その双方より小さくなる場合、第一の閾値と第二の閾値の間の値となる場合がある。それらの場合を上記第一の制御状態、第二の制御状態及び第三の制御状態に対応付けることができる。

移動局との間の電波伝送路の状態が特に良好でない基地局からの送信電力制御情報を移動局の送信電力制御に用いるべき送信電力制御情報を決定する際に考慮しないようにできるという観点から、本発明は、請求項６に記載されるように、上記送信電力制御装置において、上記送信電力制御情報決定手段は、移動局にて得られる各基地局からの送信電力制御情報から、上記伝搬損失演算手段にて演算された移動局との間の電波伝送路の伝搬損失が最小となる基地局からの送信電力制御情報を選択する選択手段を有し、該選択手段にて選択された送信電力制御情報に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するように構成することができる。

請求項３乃至５と同様に、上記送信電力制御情報決定手段は、請求項７乃至９に記載されるように構成することができる。

また、無駄のない送信電力制御が可能となるという観点から、本発明は、請求項１０に記載されるように、上記送信電力制御装置において、上記送信電力制御情報決定手段は、移動局との間の電波伝送路の伝搬損失がより小さい基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報のうちから電力減少の制御状態を表す送信電力制御情報により近い補正情報が優先されるように決められた重み補正制御情報に基づいて制御情報を生成する制御情報生成手段とを有し、該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するように構成することができる。

また、上記各基地局から送信される送信電力制御情報は、電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報であると共に、移動局が各基地局からの送信電力制御情報を軟判定値として取得する場合、上記制御情報生成手段は、請求項１１に記載されるように、上記重み補正手段にて得られた各基地局からの送信電力制御情報に対応した重み補正制御情報の値を所定の閾値を用いて硬判定する硬判定手段と、各基地局からの送信電力制御情報に対応した硬判定結果のいずれかを電力減少の制御状態を表す硬判定結果が優先されるように選択する選択手段とを有し、該選択手段にて選択された硬判定結果に基づいて制御情報を生成するように構成することができる。

上述したように、移動局との間の電波伝送路の良好な基地局からの送信電力制御情報を優先的に考慮すると共に、無駄のない送信電力を可能にするという観点から、本発明は、請求項１２に記載されるように、上記送信電力制御装置において、上記送信電力制御決定手段は、上記伝搬損失演算手段にて演算された各伝搬損失が所定の伝搬損失より小さいか否かを判定する伝搬損失判定手段と、該伝搬損失判定手段にて上記所定の伝搬損失より小さいと判定された伝搬損失が１つである場合、その判定された伝搬損失に対応した基地局からの送信電力制御情報に基づいて制御情報を生成し、上記伝搬損失判定手段にて上記所定の伝搬損失より小さいと判定された伝搬損失が複数となる場合、その複数の伝搬損失に対応した

各基地局からの送信電力制御情報のうちから電力減少の制御状態を表す送信電力制御情報により近い送信電力制御情報が優先されるように決められた送信電力制御情報に基づいて制御情報を生成し、更に、上記伝搬損失判定手段にて全ての伝搬損失が上記所定の伝搬損失より小さくないと判定された場合、各基地局からの送信電力制御情報のうちから電力減少の制御状態を表す送信電力制御情報により近い送信電力制御情報が優先されるように決められた送信電力制御情報に基づいて制御情報を生成する制御情報生成手段とを有し、該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するように構成することができる。

上記第一の課題を解決するため、本発明は、請求項１３に記載されるように、移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御装置において、各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の電波伝送路での伝搬損失を演算する伝搬損失演算手段と、移動局でのフェージングの状態を測定するフェージング測定手段と、該フェージング測定手段にて測定された移動局でのフェージングの状態が所定の状態より良好であるか否かを判定するフェージング状態判定手段と、該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好であると判定されたときに第一の送信電力制御情報決定手段を有効にし、該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好でないと判定されたときに第二の送信電力制御情報決定手段を有効にする切換え制御手段とを有し、上記第一の送信電力制御情報決定手段は、移動局との間の電波伝送路の伝搬損失がより小さい基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対してを重み付けを行って重み補正制御情報を生成する重み補正手段と、該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段とを有し、該合成手段にて得られた合成送信電力制御情報に基づいて移動局の送信電力

制御に用いられるべき送信電力制御情報を決定するようにし、上記第二の送信電力制御情報決定手段は、移動局にて得られる各基地局からの送信電力制御情報から、上記伝搬損失演算手段にて演算された移動局との間の電波伝送路の伝搬損失が最小となる基地局からの送信電力制御情報を選択する選択手段を有し、該選択手段にて選択された送信電力制御情報に基づいて移動局での送信電力制御に用いられるべき送信電力制御情報を決定するように構成される。

このような送信電力制御装置では、移動局でのフェージングの状態が所定の状態より良好な場合、各基地局と移動局との間の電波伝送路の状態をより忠実に表す伝搬損失と、移動局にて得られる各基地局からの送信電力制御情報とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報が決定される。一方、移動局でのフェージングの状態が所定の状態より良好でない場合、移動局との間の電波伝送路での伝搬損失が最小となる基地局からの送信電力制御情報に基づいて移動局での送信電力制御に用いられるべき送信電力制御情報が決定されるので、移動局との間の電波伝送路の状態が特に良好でない基地局からの送信電力制御情報は、移動局の送信電力制御に用いるべき送信電力制御情報を決定する際に考慮されなくなる。

更に、上記第一の課題を解決するため、本発明は、請求項１４に記載されるように、移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御装置において、各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局が無線接続すべき基地局を決定するために用いられる移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手段と、移動局にて得られる各基地局からの送信電力制御情報と、上記伝送路品質測定手段にて得られた移動局と各基地局との間の伝送路品質とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手段とを有するように構成される。

このような送信電力制御装置では、各基地局と移動局との間の電波伝送路の状態をより忠実に表す伝送路品質と、移動局にて得られる各基地局からの送信電力

制御情報とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報が決定される。更に、上記のように測定される移動局と各基地局との間の伝送路品質は、もともと移動局が無線接続すべき基地局を決定するために用いられるものであり、当該送信電力制御装置の構成を簡略化することが可能となる。

上記各基地局から固定的な送信電力にて送信される所定の信号に基づいて測定される伝送路品質は、移動局と各基地局間の距離、フェージングの状態などを表し得るものであって、移動局が無線接続すべき基地局を決定するために用いられるものであれば特に限定されず、例えば、伝搬損失、移動局での該所定の信号の受信レベル及び該所定の信号に基づいて測定される希望波対干渉波及び雑音電力比（受信ＳＩＲ（SIR：Signal to Interference plus noise power Ratio））のいずれであってもよい。

また、上記第一の課題を解決するため、本発明は、請求項１５に記載されるように、移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報となる送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報の軟判定値に基づいて移動局の送信電力を制御する送信電力制御装置において、各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手段と、移動局にて得られる各基地局からの送信電力制御情報の軟判定値と、上記伝送路品質測定手段にて測定された各基地局と移動局との間の伝送路品質に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手段とを有し、該送信電力制御手段は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報の軟判定値に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段と、該合成手段にて得られた合成送信電力制御情報の値を、各基地局から送信される送信電力制御情報が取り得る第一の値と第二の値との中間

値より所定量だけ第一の値寄りの値となる閾値を用いて硬判定する硬判定手段とを有し、その硬判定結果に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するように構成される。

上記各基地局から固定的な送信電力にて送信される所定の信号に基づいて測定される移動局と各基地局との間の伝送路品質は、移動局と各基地局間の距離、フェージングの状態などを表し得るものであれば特に限定されず、例えば、伝搬損失、移動局での該所定の信号の受信レベル及び該所定の信号に基づいて測定される希望波対干渉波及び雑音電力比（受信ＳＩＲ（SIR：Signal to Interference plus noise power Ratio））のいずれであってもよい。

更に、上記第一の課題を解決するため、本発明は、請求項１６に記載されるように、移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報となる送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報の軟判定値に基づいて移動局の送信電力を制御する送信電力制御装置において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手段と、移動局にて得られる各基地局からの送信電力制御情報の軟判定値と、上記伝送路品質測定手段にて測定された各基地局と移動局との間の伝送路品質に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手段とを有し、該送信電力制御手段は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報の軟判定値に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段と、該合成手段にて得られた合成送信電力制御情報の値を第一の閾値を用いて硬判定する第一の硬判定手段と、上記合成送信制御情報の値を上記第一の閾値と異なる第二の閾値を用いて硬判定する第二の硬判定手段と、上記第一の硬判定手段での判定結果及び第二の硬判定手段での判定手段に

基づいて、電力増加の制御情報を表す第一の制御情報、電力減少の制御状態を表す第二の制御情報及び電力維持の制御状態を表す第三の制御情報のいずれかを生成する制御情報生成手段とを有し、該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するように構成される。

また、上記第一の課題を解決するため、本発明は、請求項１７に記載されるように、移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御装置において、各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手段と、移動局でのフェージングの状態を測定するフェージング測定手段と、該フェージング測定手段にて測定された移動局でのフェージングの状態が所定の状態より良好であるか否かを判定するフェージング状態判定手段と、該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好であると判定されたときに第一の送信電力制御情報決定手段を有効にし、該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好でないと判定されたときに第二の送信電力制御情報決定手段を有効にする切換え制御手段とを有し、上記第一の送信電力制御情報決定手段は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段とを有し、該合成手段にて得られた合成送信電力制御情報に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにし、上記第二の送信電力制御情報決定手段は、移動局にて得られる各基地局からの送信電力制御情報から、上記伝送路品質測定手段にて測定された移動局との間の伝送路品質が最良となる基地局からの送信電力制御情報を選択する選択手段を有し、該選択手段にて選択された送信電

力制御情報に基づいて移動局での送信電力制御に用いられるべき送信電力制御情報を決定するように構成される。

上記第二の課題を解決するため、本発明は、請求項１８に記載されるように、移動通信システムにおいて複数の基地局と無線接続され得る移動局において、複数の基地局からの信号を合成する信号合成手段と、該信号合成手段にて得られた合成信号から下り伝送情報を復元する情報復元手段と、上記信号合成手段にて得られた合成信号の受信品質を演算する受信品質演算手段と、該受信品質演算手段にて演算された受信品質に基づいて各基地局の送信電力を制御するための送信電力制御情報を生成する送信電力制御情報生成手段と、該送信電力制御情報生成手段にて生成された送信電力制御情報を各基地局に送信する送信電力制御情報送信手段と、前述した送信電力制御装置のいずれかとを有するように構成される。

上記第三の課題を解決するため、本発明は、請求項２５に記載されるように、他の通信装置と信号の無線送受信を行い、受信信号品質に基づいて決定した上記他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信する通信装置での送信電力を上記他の通信装置からの所定の情報に基づいて制御する送信電力制御方法において、上記受信信号品質が所定の品質より低下したか否かを判定する品質判定手順と、該品質判定手順により当該受信信号品質が所定の品質より低下したと判定されたときに、送信電力を、上記他の通信装置からの所定の情報にかかわらず、当該判定時の送信電力値から所定の特性に従って上昇させる自律制御手順とを有するように構成される。

このような送信電力制御方法では、通信装置での受信信号品質が所定の品質より低下すると、当該通信装置において送信電力が、上記他の通信装置からの所定の情報にかかわらず、所定の特性に従って自律的に上昇させられる。

このように当該通信装置での送信電力が上昇されることにより、受信信号品質に基づいて決定される他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信した際に、当該送信電力制御情報の上記他の通信装置での受信品質が改善される。その結果、上記他の通信装置は、その品質の改善された送信電力制御情報に基づいて送信電力制御を行えるようになる。

上記受信信号品質は、他の通信装置から送信制御がなされつつ送信される信号

の当該通信装置での受信品質を表すものであれば、どのような情報によっても表すことができ、例えば、その信号の受信レベルであっても、その信号と干渉波として作用する他の信号や雑音との比を表すＳＩＲ（Signal to Interference plus noise power ratio）であってもよい。

また、上記送信電力を上昇させるための所定の特性は、上記判定時の送信電力値より低下しなければ、どのような特性であってもよく、ある傾きをもって徐々に上昇する特性であっても、ある値までステップ状に上昇させた後に、その値を維持するような特性であってもよい。更に、徐々に上昇させる過程で一時的に電力値が低下しても、その低下後の電力値が上記判定時の電力値より小さくならなければよい。

当該通信装置の送信電力制御に用いられる上記他の通信装置からの所定の情報は、上記他の通信装置から当該通信装置の送信電力制御に用いられる情報として伝送される情報であれば特に限定されず、上記他の通信装置にて測定された当該通信装置からの信号の受信品質に基づいて作成した送信電力制御情報であっても、上記他の通信装置において測定された当該通信装置からの信号の受信品質に関する情報であっても、更に、他の情報であってもよい。

上記通信装置が、受信信号品質値が目標受信品質値に近づくように決定した送信電力制御情報を他の通信装置に送信するものである場合、容易に受信品質の状態を判定できるという観点から、請求項２６に記載されるように、上記品質判定手順は、上記受信信号品質値が第一の閾値より低下したか否かを判定する第一の閾値判定手順を有し、上記第一の閾値判定手順にて上記受信信号品質値が上記第一の閾値より低下していると判定されたときに、上記受信信号品質が所定の品質より低下したと判定するように構成することができる。

また、同様の観点から、請求項２７に記載されるように、上記品質判定手順は、上記目標受信品質値から上記受信品質値を減算して差分値を演算する差分値演算手順と、上記差分値演算手順にて演算された当該差分値が第二の閾値以上となるか否かを判定する第二の閾値判定手順とを有し、上記第二の閾値判定手順にて上記差分値が上記第二の閾値以上となると判定されたときに、上記受信信号品質が所定の品質より低下したと判定するように構成することができる。

更に、上記通信装置が、受信信号品質値が所定のパラメータに従って制御される目標受信品質値に近づくよう決定した送信電力制御情報を他の通信装置に送信するものである場合、上記と同様の観点から、請求項２８に記載されるように、上記品質判定手順は、上記受信信号品質値が第一の閾値より低下したか否かを判定する第一の閾値判定手順と、上記目標受信品質値から上記受信品質値を減算して差分値を演算する差分値演算手順と、上記差分値演算手順にて演算された当該差分値が第二の閾値以上となるか否かを判定する第二の閾値判定手順と、上記第一の閾値判定手順にて上記受信信号品質値が上記第一の閾値より低下していると判定されたとき、または、上記第二の閾値判定手順にて上記差分値が上記第二の閾値以上であると判定されたときに、上記受信信号品質が所定の品質より低下したと判定するように構成することができる。

上記目標受信品質値の制御の基礎となる所定のパラメータは、特に限定されず、目標受信品質値が固定値ではなくその制御により変化する場合に、上記構成は有効となる。上記所定のパラメータは、例えば、通信装置にて得られる受信信号に含められた伝送情報の誤り率などを用いることができる。

上記自律制御手順は、例えば、請求項２９に記載されるように、上記所定の特性に従って送信電力を上昇させる自律送信電力制御情報を生成する手順と、上記品質判定手順により上記受信信号品質が所定の品質より低下したと判定されたときに、上記他の通信装置からの送信電力制御情報に基づいた送信電力制御から上記自律送信電力制御情報に基づいた送信電力制御に切換える制御切換え手順とを有するように構成することができる。

受信信号品質の改善がなされないまま無駄な送信電力上昇制御が行なわれることを防止するという観点から、本発明は、請求項３０に記載されるように、上記各送信電力制御方法において、上記自律制御手順は、上記所定の特性に従って送信電力を上昇させる過程で、その送信電力の上昇量が所定量に達したか否かを判定する判定手順と、該判定手順にてその送信電力の上昇量が所定量に達したと判定されたときに、上記所定の特性に従って送信電力を上昇させることを停止させる自律制御停止手順とを有するように構成することができる。

上記第三の課題を解決するため、本発明は、請求項３１に記載されるように、

他の通信装置と信号の無線送受信を行い、受信信号品質に基づいて決定した上記他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信する通信装置での送信電力を上記他の通信装置からの所定の情報に基づいて制御する送信電力制御装置において、上記受信信号品質が所定の品質より低下したか否かを判定する品質判定手段と、該品質判定手段により当該受信信号品質が所定の品質より低下したと判定されたときに、送信電力を、上記他の通信装置からの所定の情報にかかわらず、当該判定時の送信電力値から所定の特性に従って上昇させる自律制御手段とを有するように構成される。

また、上記第四の課題は、請求項３７に記載されるように、他の通信装置と信号の無線送受信を行い、受信信号品質に基づいて決定した上記他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信する送信電力制御情報送信手段と、

上記他の通信装置からの所定の情報に基づいて送信電力を制御する制御手段と、

請求項３１乃至３６いずれか記載の送信電力制御装置を有する通信装置にて解決される。

更に、上記第五の課題を解決するため、本発明は、請求項３９に記載されるように、移動通信システムにおける基地局と移動局との間で情報データの伝送が開始される前において、基地局から移動局での送信電力制御に用いられるべき送信電力制御情報を送信すると共に基地局と移動局との間で信号を送受信して同期をとるための処理がなされる際に移動局での送信電力を制御する送信電力制御方法において、基地局からの信号に対する移動局での同期が確立された後に、基地局からの送信電力制御情報に係わらず、送信電力を、初期値から所定の特性に従って上昇させるように制御する自律制御手順を有するように構成される。

このような送信電力制御方法では、移動局と基地局との間で情報データの伝送が開始される前において、基地局と移動局との間で信号を送受信して同期をとるための処理がなされる際に、移動局では、基地局からの送信電力制御情報に係わらず、送信電力が初期値から所定の特性に従って上昇するように制御される。

上記所定の特性は、基地局からの送信電力制ｆ１御情報が急激に送信電力を上

昇させる特性を表すものであったとしても、その送信電力制御情報と関係なく、同期確立がより早期に行えると共に、より無駄のない送信電力制御が行えるという観点から決めることができる。この所定の特性は、上記初期値より送信電力が低下することがなければ、上記観点に従って任意に決めることができ、徐々に上昇する特性であっても、ある値までステップ状に上昇させた後に、その値を維持するような特性であってもよい。

特に、本発明は，請求項４０に記載されるように、上記送信電力制御方法において、上記自律制御手順は、上記基地局からの送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を上昇させるように制御するように構成することができる。

上記自律制御手順に従った送信電力制御の停止時期にて送信電力制御の切換えをスムーズに行うようにするという観点から、本発明は、請求項４１に記載されるように、上記送信電力制御方法において、上記自律制御手順による送信電力の制御が開始された後に、当該自律制御手順による送信電力の制御を停止させるべき所定の条件が満足されたか否かを判定する自律制御停止条件判定手順と、該自律制御停止条件判定手順によって上記所定の条件が満足されたと判定されたときに、上記自律制御手順による送信電力の制御から上記基地局からの送信電力制御情報に基づいた送信電力の制御に切換える制御切換え手順とを有するように構成することができる。

上記のような送信電力制御方法では、上記所定の条件が満足されたとの判定時に、自律制御手順に従った送信電力の制御から基地局からの送信電力制御情報に基づいた送信電力の制御に切替わる。

上記自律制御手順による送信電力の制御を停止させるべき所定の条件は、基地局からの情報に係わりなく移動局にて判断できる条件であっても、基地局からの情報に基づいて移動局にて判断できる条件であってもよい。

前者の場合、より簡易にその停止時期を判定できるという観点から、本発明は、請求項４２に記載されるように、上記送信電力制御方法において、上記自律制御停止条件判定手順は、上記自律制御手順による送信電力の制御が開始されてから所定時間が経過したか否かを判定し、上記自律制御手順による送信電力の制御

が開始されてから上記所定時間が経過したとの判定を上記所定の条件が満足されたとの判定とするように構成することができる。

また、後者の場合、本発明は、請求項４３に記載されるように、上記送信電力制御方法において、上記基地局は、当該基地局での同期が確立される前では、所定の送信電力制御情報を送信し、上記移動局からの信号に基づいて当該基地局での同期が確立された後では、移動局から送信される信号の受信品質に基づいて決められる閉ループ送信電力制御情報を送信するようにし、上記自律制御停止条件判定手順は、上記基地局から受信される送信電力制御情報が、上記所定の送信電力制御情報から閉ループ送信電力制御情報に変わったか否かを判定する制御情報変更判定手順を有し、該制御情報変更判定手順にてなされる上記基地局から受信される送信電力制御情報が上記所定の送信電力制御情報から閉ループ送信電力制御情報に変わったとの判定を上記所定の条件が満足されたとの判定とするように構成することができる。

基地局から送信される所定の送信電力制御情報が正しく移動局にて受信されない場合に、基地局からの送信電力制御情報が閉ループ送信電力制御情報に変わったと誤って判定される可能性を低減するという観点から、本発明は、請求項４４に記載されるように、上記送信電力制御方法において、上記自律制御停止条件判定手順は、上記自律制御手順による送信電力制御が開始されたから所定時間が経過したか否かを判定する開始タイミング判定手順を有し、該開始タイミング判定手順にて上記自律制御手順による送信電力制御が開始されてから上記所定時間が経過したと判定されたときに、上記制御情報変更判定手順に従った判定を開始するように構成することができる。

このような送信電力制御方法では、上記自律制御手順による送信電力制御が開始されてから少なくとも上記所定時間は、基地局からの送信電力制御情報が閉ループ送信電力制御であると判定されることはない。

上記第五の課題を解決するため、本発明は、請求項４５に記載されるように、移動通信システムにおける基地局と移動局との間で情報データの伝送が開始される前において、基地局から移動局での送信電力制御に用いられるべき送信電力制御情報を送信すると共に基地局と移動局との間で信号を送受信して同期をとるた

めの処理がなされる際に移動局での送信電力を制御する送信電力制御方法において、基地局からの信号に対する移動局での同期が確立された後に、該基地局からの送信電力制御情報に基づいて生成される当該送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を制御するための緩特性送信電力制御情報に基づいて送信電力を制御する緩特性送信電力制御手順を有するように構成される。

このような送信電力制御方法では、移動局と基地局との間で情報データの伝送が開始される前において、基地局と移動局との間で信号を送受信して同期をとるための処理がなされている際に、移動局では、基地局からの送信電力制御情報に基づいて生成される緩特性送信電力制御情報に基づいて送信電力の制御がなされる。これにより、基地局からの送信電力制御情報が急激に送信電力を変化させる特性を表すものであったとしても、その特性より緩やかに変化する特性にて移動局での送信電力を制御することができる。

上記緩特性送信電力制御情報は、基地局からの送信電力制御情報に基づいて生成されたものであれば特に限定されず、例えば、その送信電力制御情報から部分的に抽出された情報に基づいて作成されたものであっても、また、その送信電力制御情報を細分化して得られる各部分の平均的な情報に基づいて作成されたものであってもよい。

また、上記緩特性送信電力制御手順に従った送信電力制御の停止時期にて送信電力制御の切換えをスムーズに行うようにするという観点から、本発明は、請求項４６に記載されるように、上記送信電力制御方法において、上記緩特性送信電力制御手順による送信電力制御が開始された後に、当該緩特性送信電力制御手順による送信電力の制御を停止させるべき所定の条件が満足されたか否かを判定する緩特性送信電力制御停止判定手順と、該緩特性送信電力制御停止判定手順によって上記所定の条件が満足されたと判定されたときに、上記緩特性送信電力制御手順による送信電力の制御から上記基地局からの送信電力制御に基づいた送信電力の制御に切換える制御切換え手順とを有するように構成することができる。

更に、上記第一の課題を解決するため、本発明は、請求項４７に記載されるように、移動通信システムにおける基地局と移動局との間で情報データの伝送が開

始される前において、基地局から移動局での送信電力制御に用いられるべき送信電力制御情報を送信すると共に基地局と移動局との間で信号を送受信して同期をとるための処理がなされる際に移動局での送信電力を制御する送信電力制御装置において、基地局からの信号に対する移動局での同期が確立された後に、基地局からの送信電力制御情報に係わらず、送信電力を、初期値から所定の特性に従って上昇させるように制御する自律制御手段を有するように構成される。

また、上記第五の課題を解決するため、本発明は、請求項５３に記載されるように、移動通信システムにおける基地局と移動局との間で情報データの伝送が開始される前において、基地局から移動局での送信電力制御に用いられるべき送信電力制御情報を送信すると共に基地局と移動局との間で信号を送受信して同期をとるための処理がなされる際に移動局での送信電力を制御する送信電力制御装置において、基地局からの信号に対する移動局での同期が確立された後に、該基地局からの送信電力制御情報に基づいて生成される当該送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を制御するための緩特性送信電力制御情報に基づいて送信電力を制御する緩特性送信電力制御手段を有するように構成される。

上記第六の課題を解決するため、本発明は、請求項５５に記載されるように、送信電力制御に用いられるべき送信電力制御情報を送信する基地局に対して情報データの伝送を行う前において、基地局との間で信号を送信して同期をとるための処理がなされる際に送信電力を制御する送信電力制御装置を有する移動局において、上記送信電力制御装置は、基地局からの信号に対する当該移動局での同期が確立された後に、基地局からの送信電力制御情報に係わらず、送信電力を、初期値から所定の特性に従って上昇させるように制御する自律制御手段を有するように構成される。

更に、上記第六の課題を解決するため、本発明は、請求項５７に記載されるように、送信電力制御に用いられるべき送信電力制御情報を送信する基地局に対して情報データの伝送を行う前において、基地局との間で信号を送信して同期をとるための処理がなされる際に送信電力を制御する送信電力制御装置を有する移動局において、上記送信電力制御装置は、基地局からの信号に対する移動局での同

期が確立された後に、該基地局からの送信電力制御情報に基づいて生成される当該送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を制御するための緩特性送信電力制御情報に基づいて送信電力を制御する緩特性送信電力制御手段を有するように構成される。

なお、本発明の他の目的、特徴、利点は、添付図面と共になされる以下の詳細な説明にて、明らかにされる。

発明を実施するための最良の形態

以下、本発明の実施の形態を図面に基づいて説明する。

（請求の範囲１～２４の実施例）

本発明の実施の一形態に係る送信電力制御方法が適用されるＣＤＭＡ方式の移動通信システムにおけるソフトハンドオーバの一般的なモデルが図１に示される。

図１において、ソフトハンドオーバでは、移動局ＭＳは、基地局ＢＳ１のサービスエリアから基地局ＢＳ２のサービスエリアへの移動中に、それらのサービスエリアの境界領域において、双方の基地局ＢＳ１、ＢＳ２と無線接続される。この状態で、移動局ＭＳは、各基地局ＢＳ１、ＢＳ２から受信した信号を合成し、その合成信号から伝送情報を取得する。また、各基地局ＢＳ１、ＢＳ２は、移動

局ＭＳから送信される信号を受信し、それらの受信信号が、例えば、上位局にて合成され、その合成信号から移動局ＭＳからの伝送情報が得られる。

上記移動局ＭＳと各基地局ＢＳ１、ＢＳ２とが無線接続された状態で、移動局ＭＳ及び各基地局ＢＳ１、ＢＳ２は、それぞれ通信相手局から伝送される送信電力制御ビットに基づいて送信電力制御を行う。

上記移動局ＭＳは、例えば、図２に示すように構成される。

図２において、移動局ＭＳは、送受分離部２０を有すると共に、送信系として、誤り訂正符号化部１１、データビット変調部１２、送信電力制御ビット変調部１３、拡散部１４、無線送信部１５及び送信電力制御部１６を有する。

情報源（音声処理部、データ処理部など）からのデータに対して、所定の処理、例えば、CRC（cycle redundancy check）の手法に従って誤り検出用のパリティビットをフレーム単位に付加するなどの処理がなされる。誤り訂正符号化部１１は、上記のような処理により得られたフレーム単位のパリティビット付きデータの符号化を行う。データビット変調部１２は、誤り訂正符号化部１１からのフレーム単位の符号化データに基づいてデータ変調信号を生成する。

送信電力制御ビット変調部１３は、後述するように生成される基地局の送信電力を制御するための送信電力制御ビットに基づいて制御ビット変調信号を生成する。この制御ビット変調信号は、例えば、送信電力制御ビット「１」（電力増加を表す）に対応した値「＋１」及び送信電力制御ビット「０」（電力低減を表す）に対応した値「－１」のいずれかの値を表す。

拡散部１４は、上記データビット変調部１２にて生成されたデータ変調信号及び送信電力制御ビット変調部１３にて生成された制御ビット変調信号を多重化し、移動局ＭＳ固有の拡散コードを用いてその多重化された信号の拡散処理を行う。この拡散部１４にて得られた拡散信号は、所定の周波数の信号として無線送信部１５から送受分離部２０を介して送信される。

送信電力制御部１６は、後述するように生成される送信電力制御信号に基づいて無線送信部１５での送信電力を制御する。上記送信電力制御信号は、例えば、送信電力増加、送信電力低減及び送信電力維持のいずれかの制御動作を表し得る。送信電力制御部１６は、その送信電力制御信号が表す制御動作に従って、無線

送信部１５での送信電力を所定量（dB）だけ増加または低減させ、あるいは現在の送信電力を維持させる。

なお、各基地局ＢＳ１、ＢＳ２は、上記移動局ＭＳの送信系と略同様の構成となる送信系を有している。これにより、各基地局ＢＳ１、ＢＳ２は、データと移動局ＭＳでの送信電力を制御するための送信電力制御ビットとを多重化し、その多重化された信号を固有の拡散コードを用いて送信する。

また、移動局ＭＳは、受信系として、無線受信部２１、２つの逆拡散部２２、２３、復調／合成部２４、誤り訂正復号／誤り検出部２５、誤り測定部２６、ＳＩＲ測定部２７、目標ＳＩＲ決定部２８、ＳＩＲ比較部２９及び送信電力制御ビット決定部３０を有している。

ソフトハンドオーバに際して各基地局ＢＳ１、ＢＳ２から送信されるデータ及び送信電力制御ビットが多重化された拡散信号が送受分離部２０を介して無線受信部２１にて受信されると、その受信信号が逆拡散部２２及び２３に供給される。逆拡散部２２は、基地局ＢＳ１固有の拡散コードを用いてその受信信号の逆拡散処理を行う。この逆拡散処理にて、基地局ＢＳ１から伝送されるデータ及び送信電力制御ビットに対応した受信データ信号及び受信送信電力制御ビット信号（以下、受信 TPC 信号１という）が得られる。逆拡散部２３は、基地局ＢＳ２固有の拡散コードを用いてその受信信号の逆拡散処理を行う。この逆拡散処理にて、基地局ＢＳ２から伝送されるデータ及び送信電力制御ビットに対応した受信データ信号及び受信送信電力制御ビット信号（以下、受信 TPC 信号２という）が得られる。

復調／合成部２４は、逆拡散部２２及び２３にて得られた各受信データ信号を復調して合成し、合成ベースバンド信号を生成する。その合成ベースバンド信号は、誤り訂正復号／誤り検出部２５に供給され、フレーム単位に誤り訂正復号がなされると共に、CRC の手法に従って伝送誤りの有無の検出がなされる。その復号結果が情報出力として当該移動局ＭＳの信号処理部（図示略）に供給される。この誤り訂正復号／誤り検出部２５は、更に、フレーム単位毎に上記誤りの有無を表す誤り検出結果を出力する。

誤り率測定部２６は、上記誤り訂正復号／誤り検出部２５からの誤り検出結果

に基づいて、例えば、フレーム誤り率（FER：Frame Error Rate）を受信信号（希望波）から復元した情報の受信品質として演算する。

ＳＩＲ測定部２７は、復調／合成部２４からの合成ベースバンド信号に基づいて受信ＳＩＲ（希望波対干渉波及び雑音電力比）を演算する。目標ＳＩＲ決定部２８は、誤り率測定部２６から出力される情報の受信品質（FER）が目標品質となるように、目標ＳＩＲを決定する（アウターループ制御）。ＳＩＲ比較部２９は、上記ＳＩＲ測定部２７からの受信ＳＩＲと目標ＳＩＲ決定部２８からの目標ＳＩＲとを比較し、その比較結果を出力する。

送信電力制御ビット決定部３０は、ＳＩＲ比較部２９からの比較結果に基づいて送信電力制御ビットの値を決定する（インナーループ制御）。具体的には、受信ＳＩＲが目標ＳＩＲより小さい場合、希望波の受信レベルが低いとして、送信電力制御ビットが送信電力を増加させるべき値「１」に決定される。一方、受信ＳＩＲが目標ＳＩＲ以上となる場合、希望波受信レベルが高いとして、送信電力制御ビットが送信電力を低減させるべき値「０」に決定される。このように値の決定される送信電力制御ビットは、前述したような送信電力制御ビット変調部１３に供給される。これにより、この送信電力制御ビットは、各基地局ＢＳ１、ＢＳ２に伝送され、各基地局ＢＳ１、ＢＳ２は、その送信電力制御ビットに基づいて送信電力制御を行う。

なお、各基地局ＢＳ１、ＢＳ２は、上記移動局ＭＳの受信系と同様に、上記のように送信電力制御のなされる移動局からの信号の受信ＳＩＲを測定し、その受信ＳＩＲが目標ＳＩＲに近づくように送信電力制御ビットを決定している。

また、各基地局ＢＳ１、ＢＳ２は、上記データ及び送信電力制御ビットの伝送に用いられる拡散コードとは異なる拡散コードで拡散されたパイロットチャネルにてパイロット信号を常時固定電力値にて送信している。各基地局から送信されるパイロット信号は、移動局ＭＳがソフトハンドオーバに際して無線接続すべき基地局を決定するために用いられる。即ち、移動局ＭＳは、各基地局からのパイロット信号を受信し、そのパイロット信号の受信レベルまたは受信ＳＩＲ、あるいは、これらの値と基地局から別途通知されているパイロット信号の送信レベルとを用いて求めた基地局及び移動局間の伝搬損失に基づいて無線接続すべき基地

局を決定する。

ここで、パイロット信号の送信レベルは、各基地局のアンテナから送信されるパイロット信号の送信レベルを報知情報として移動局ＭＳに通知されている値である。このパイロット信号の送信レベル（dBm）から移動局ＭＳで測定された受信レベル（dBm）を減算した値が伝搬損失（dB）となる。伝播損失値を求める際に用いる受信レベルは、電波伝送路の状態の瞬時変動（フェージング変動）分の影響を受けない程度に平均化を施すことで距離変動分をより忠実に表すことができる。

移動局ＭＳは、受信系として、更に、２つのパイロット信号復調／伝搬損失演算部３１、３２及び送信電力制御信号決定部３３を有する。各パイロット信号復調／伝搬損失演算部３１、３２は、前述したように、移動局ＭＳが無線接続すべき基地局を決定するために用いられる伝搬損失を演算する。具体的には、次のような処理がなされる。

ソフトハンドオーバに際して無線接続される基地局として決定された上記各基地局ＢＳ１、ＢＳ２から上記パイロットチャネルにて送信されるパイロット信号が送受分離部２０を介して無線受信部２１にて受信されると、その受信信号が逆拡散部２２及び２３に供給される。逆拡散部２２は、基地局ＢＳ１のパイロットチャネルの拡散コードを用いてその受信信号の逆拡散処理を行う。この逆拡散処理にて、基地局ＢＳ１から伝送されるパイロット信号に対応した受信パイロット信号が得られる。また、逆拡散部２３は、基地局ＢＳ２のパイロットチャネルの拡散コードを用いてその受信信号の逆拡散処理を行う。この逆拡散処理にて、基地局ＢＳ２から伝送されるパイロット信号に対応した受信パイロット信号が得られる。

逆拡散部２２にて得られた受信パイロット信号は、パイロット信号復調／伝搬送信演算部３１に供給される。パイロット信号復調／伝搬損失演算部３１は、供給される受信パイロット信号を復調し、その復調信号からパイロット信号の受信レベル（dBm）を演算する。そして、このパイロット信号の受信レベル（dBm）と上述したようにネットワーク側から報知情報として通知されるパイロット信号の送信レベル（dBm）とを用いて移動局ＭＳと基地局ＢＳ１との間の電波伝送路

での伝搬損失１が演算される。具体的には、パイロット信号の送信レベル（dBm）とパイロット信号の受信レベル（dBm）との差分が伝搬損失１（dB）として演算される。

上記逆拡散部２３にて得られた受信パイロット信号は、パイロット信号復調／伝搬損失演算部３２に供給される。パイロット信号復調／伝搬損失演算部３２は、供給される受信パイロット信号を復調し、その復調信号からパイロット信号の受信レベル（dBm）を演算する。そして、上記パイロット信号復調／伝搬損失演算部３１と同様に、そのパイロット信号の送信レベル（dBm）と報知情報として通知されたパイロット信号の受信レベル（dBm）との差分が、移動局ＭＳと基地局ＢＳ２との間の電波伝送路での伝搬損失２（dB）として演算される。

上述したように逆拡散部２２にて得られた基地局ＢＳ１から送信される送信電力制御ビットに対応した受信 TPC 信号１、逆拡散部２３にて得られた基地局ＢＳ２から送信される送信電力制御ビットに対応した受信 TPC 信号２、及び上記パイロット信号復調／伝搬損失演算部３１にて得られた移動局ＭＳと基地局ＢＳ１との間の電波伝送路での伝搬損失１、上記パイロット信号復調／伝搬損失演算部３２にて得られた移動局ＭＳと基地局ＢＳ２との間の電波伝送路での伝搬損失２が送信電力制御信号決定部３３に供給される。

送信電力制御信号決定部３３は、移動局ＭＳと無線接続された各基地局ＢＳ１、ＢＳ２から伝送される２つの送信電力制御ビットの情報に基づいて当該移動局ＭＳでの送信電力制御信号を決定するもので、上記受信 TPC 信号１、受信 TPC 信号２、伝搬損失１及び伝搬損失２に基づいて送信電力制御信号を決定する。この送信電力制御信号を決定するに際して、上記伝搬損失１及び伝搬損失２は、上記受信 TPC 信号１及び受信 TPC 信号２の信頼度として考慮される。

図３を参照して送信電力制御信号決定部３３の第一の構成例について説明する。

図３において、送信電力制御信号決定部３３は、２つの TPC 復調部３０１、３０２、TPC 軟判定値重み合成部３０３及び硬判定部３０４を有している。TPC 軟判定値重み合成部３０３は、重み係数決定部３１０、２つの重み補正部３１１、３１２及び合成部３１３を有する。

上記 TPC 復調部３０１は、上記逆拡散部２２からの受信 TPC 信号１を復調し、その復調信号のレベル値を基地局ＢＳ１からの送信電力制御ビットの軟判定値 TPC-SS1 として出力する。上記 TPC 復調部３０２は、上記逆拡散部２３からの受信 TPC 信号２を復調し、その復調信号のレベル値を基地局ＢＳ２からの送信電力制御ビットの軟判定値 TPC-SS2 として出力する。これらの軟判定値 TPC-SS1 及び TPC-SS2 は、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の電波伝送路の状態を反映しており、例えば、上述したように、送信電力制御ビットが「＋１」、「－１」の値に変調されて伝送される場合、理想的な伝送路の状態では、「＋１」または「－１」となる。

TPC 軟判定値重み合成部３０３の重み係数決定部３１０は、伝搬損失１と伝搬損失２とに基づいて上記軟判定値 TPC-SS1 及び軟判定値 TPC-SS2 に対する重み係数を決定する。この重み係数決定部３１０は、より小さい伝搬損失に対してより大きい重み係数となるようにその重み係数を決定する。例えば、各伝搬損失１、２の逆数に基づいた重み係数が決定される。

重み補正部３１１は、上記送信電力制御ビットの軟判定値 TPC-SS1 に上記伝搬損失１に対応した重み係数を乗じ、その補正値を出力する。また、重み補正部３１２は、上記送信電力制御ビットの軟判定値 TPC-SS2 に上記伝搬損失２に対応した重み係数を乗じ、その補正値を出力する。これにより、上記伝搬損失１及び２が、上記送信電力制御ビットの軟判定値 TPC-SS1 及び TPC-SS2 の信頼度として考慮されることになる。即ち、伝搬損失が小さく、より信頼度が高いと見込まれる軟判定値 TPC-SS1 または TPC-SS2 に対してより大きな重み係数が乗ぜられることになる。

合成部３１３は、各重み補正部３１１、３１２から出力される各軟判定値 TPC-SS1、TPC-SS2 の補正値を最大比合成（MRC：Maximum Ration Combining）する。具体的には、各補正値が加算され、合成部３１３から TPC 合成軟判定値が出力される。

基地局ＢＳ１からの送信電力制御ビット（０，０，０，０，０，…）の軟判定値 TPC-SS1 が、例えば、

-0.2，-03，0.1，-0.3，-06，…

のように得られ、基地局ＢＳ２からの送信電力制御ビット（１，１，１，１，１，…）の軟判定値 TPC-SS2 が、例えば、

0.6, 0.3, 0.4, 0.2, -0.1, …

のように得られ、更に、例えば、伝搬損失１に対応した重み係数が 1.1、伝搬損失２に対応した重み係数が 0.9 とそれぞれ得られた場合、TPC 合成軟判定値は、

0.32, -0.06, 0.47, -0.15, -0.75, …

となる。

上記のようにして得られた TPC 合成軟判定値は硬判定部３０４に供給される。この硬判定部３０４は、供給される TPC 合成軟判定値が所定の閾値以上であるか及びその閾値より小さいかのいずれかであるかを判定し、その判定結果を送信電力制御信号として出力する。この所定の閾値が、例えば、「０」で、TPC 合成軟判定値が、例えば、上述したように、

0.32, -0.06, 0.47, -0.15, -0.75, …

となる場合、

１，０，１，０，０，…

となる送信電力制御信号が出力される。

そして、この送信電力制御信号に基づいて上述した送信電力制御部１６が無線送信部１５での送信電力を所定量だけ増加（送信電力制御信号＝１）またはその送信電力を所定量だけ減少（送信電力制御信号＝０）させる。

上述したように、移動局ＭＳでは、各基地局ＢＳ１、ＢＳ２から伝送される送信電力制御ビットの軟判定値 TPC-SS1 及び TPC-SS2 が、送信電力制御のなされない（固定送信電力にて送信される）パイロット信号の送信レベル及び受信レベルに基づいて求められた移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の伝送路での伝搬損失が信頼度として考慮されるように重み合成される。そして、その重み合成の結果得られた TPC 合成軟判定値を硬判定した結果が送信電力制御信号として決定される。このようにして決定された送信電力制御信号に基づいて移動局ＭＳでの送信電力制御がなされることにより、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の伝送路の状態をより忠実に考慮して移動局ＭＳの送信電力制御が

可能となる。

上記例では、上記硬判定部３０４での閾値が、例えば、各基地局ＢＳ１とＢＳ２から送信される送信電力制御ビットの変調信号の取り得る値「＋１」と「－１」の中心値「０」に設定される。無駄のない送信電力制御を可能にするという観点から、上記閾値を僅かに「＋１」寄りの値に決めることもできる。この場合、上記 TPC 重み合成値が送信電力を低減することを表す「０」に硬判定され易くなり、比較的低電力での送信電力制御がなされる。硬判定部３０４での閾値は、移動通信システムにおいて常に移動局と基地局間での通信が適正になされる範囲で適当に設定することができる。

また、上記硬判定部３０４は、例えば、図４に示すように構成することもできる。この硬判定部３０４は、２つの閾値 Th1、Th2 を用いている。

図４において、この硬判定決定部３０４は、第一の硬判定部３２１、第二の硬判定部３２２及び演算部３２３を有する。第一の硬判定部３２１は、TPC 軟判定値重み合成部３０３からの TPC 合成軟判定値を第一の閾値 Th1 を用いて硬判定する。即ち、TPC 合成軟判定値が上記第一の閾値 Th1 以上か、及び上記第一の閾値より小さいかのいずれであるかを判定し、その判定結果を出力する。また、第二の硬判定部３２２は、上記 TPC 合成軟判定値を上記第一の閾値 Th1 より小さい第二の閾値 Th2（Th2＜Th1）を用いて硬判定する。即ち、TPC 合成軟判定値が上記第二の閾値 Th2 以上か、及び上記第二の閾値 Th2 より小さいかのいずれであるかを判定し、その判定結果を出力する。

演算部３２３は、上記第一の硬判定部３２１からの判定値Ａ及び第二の硬判定部３２２からの判定値Ｂに基づいて得られる演算結果Ｃを送信電力制御信号として出力する。その演算論理は、例えば、図５に示すようになっている。即ち、判定値Ａが「１」(TPC 合成軟判定値が第一の閾値 Th1 以上であることを表す) で、かつ、判定値Ｂが「１」(TPC 合成軟判定値が第二の閾値 Th2 以上であることを表す) である場合、演算結果Ｃ＝「１」が送信電力を所定量（dB）だけ増加させることを表す送信電力制御信号として出力される。また、判定値Ａが「０」(TPC 合成軟判定値が第一の閾値 Th1 より小さいことを表す) で、かつ、判定値Ｂが「０」(TPC 合成軟判定値が第二の閾値 Th2 より小さいことを表す

）である場合、演算結果Ｃ＝「０」が送信電力を所定量（dB）だけ減少させることを表す送信電力制御信号として出力される。

更に、判定値Ａが「０」で、判定値Ｂが「１」である場合、即ち、TPC 合成軟判定値が第一の閾値 Th1 より小さく、第二の閾値 Th2 以上である場合、演算結果Ｃ＝「維持」が現在の送信電力を維持することを表す送信電力制御信号として出力される。なお、判定値Ａが「１」で、判定値Ｂが「０」である状況は、第一の閾値 Th1 及び第二の閾値 Th2 の大小関係（Th1＞Th2）から論理的にありえない。

このような硬判定部３０４の構成により、TPC 合成軟判定合成値が、電力増大、電力減少を明確に表しうる値とならない場合（第一の閾値 Th1 より小さく、第二の閾値 Th2 以上)、現在の送信電力が維持されるようになるので、誤って送信電力を増大させたり、減少させたりする制御を防止することができる。

次に、図６を参照して上記送信電力制御信号決定部３３の第二の構成例について説明する。なお、図６において、図３に示す部分と同様の部分については同一の参照符号が付されている。

図６において、この送信電力制御信号決定部３３は、２つの TPC 復調部３０１、３０２、比較部３０５、選択部３０６及び硬判定部３０７を有している。前述した例（図３参照）と同様に、TPC 復調部３０１、３０２は、上記逆拡散部２２、２３からの受信 TPC 信号１及び受信 TPC 信号２を復調し、その復調信号のレベル値を基地局ＢＳ１及びＢＳ２からの送信電力制御ビットの軟判定値 TPC-SS1、TPC-SS2 として出力する。

比較部３０５は、パイロット信号復調／伝搬損失演算部３１にて演算された伝搬損失１と、パイロット信号復調／伝搬損失演算部３２にて演算された伝搬損失２とを比較し、その比較結果を出力する。選択部３０６は、比較部３０５からの比較結果を選択制御信号として入力し、その選択制御信号に基づいて基地局ＢＳ１からの送信電力制御ビットの軟判定値 TPC-SS1 となる TPC 復調部３０１からの出力及び基地局ＢＳ２からの送信電力制御ビットの軟判定値 TPC-SS2 となる TPC 復調部３０２からの出力のいずれかを選択する。

比較部３０５から伝搬損失１が伝搬損失２より小さいという比較結果に基づい

た選択制御信号が選択部３０６に入力されると、選択部３０６は、TPC 復調部３０１からの出力を選択する。また、比較部３０５から伝搬損失２が伝搬損失１より小さいという比較結果に基づいた選択制御信号が選択部３０６に入力されると、選択部３０６は、TPC 復調部３０２からの出力を選択する。

硬判定部３０７は、上記のようにして選択された送信電力制御ビットの軟判定値 TPC-SS1 または TPC-SS2 は、所定の閾値を用いて硬判定し、その硬判定結果を送信電力制御信号として出力する。なお、硬判定部３０７は、前述した硬判定部３０４（図３参照）と同様の処理にて軟判定値 TPC-SS1 または TPC-SS2 の硬判定を行うことができる。

上記のような送信電力制御信号決定部３３の構成により、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の電波伝送路のうち伝搬損失が最小となる電波伝送路を通って伝送される送信電力制御ビットの軟判定値（TPC-SS1 または TPC-SS2）に基づいて送信電力制御信号が決定される。従って、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の伝送路の状態を考慮した移動局ＭＳの送信電力制御が可能となる。

なお、上記構成例（図６参照）の送信電力制御信号決定部３３にて決定された送信電力制御信号に基づいた移動機ＭＳの送信電力制御は、移動局ＭＳと各基地局との間の伝送路での伝搬損失に大きな差がある場合に、より適正な送信電力制御が可能になるという点で、好ましい。

次に、図７を参照して上記送信電力制御信号決定部３３の第三の構成例について説明する。なお、図７において、図３に示す部分と同様の部分については同一の参照符号が付されている。

図７において、この送信電力制御信号決定部３３は、２つの TPC 復調部３０１、３０２、重み係数決定部３１０、２つの重み補正部３１１、３１２、２つの硬判定部３１４、３１５及び最小値選択部３１６を有している。

上述した第一の構成例（図３参照）と同様に、重み係数決定部３１０が伝搬損失１及び伝搬損失２に対応した重み係数を決定し、重み補正部３１１、３１２が、基地局ＢＳ１、ＢＳ２からの送信電力制御ビットの軟判定値 TCP-SS1、TPC-SS2 となる TPC 復調部３０１、３０２の出力に対してその伝搬損失１、伝搬損

失２に対応する重み係数を乗じて、その補正値を出力する。

硬判定部３１４は、所定の閾値を用いて重み補正部３１１から出力される軟判定値 TPC-SS1 の補正値の硬判定を行う。また、硬判定部３１５は、所定の閾値を用いて重み補正部３１２から出力される軟判定値 TPC-SS2 の補正値の硬判定を行う。硬判定部３１４からの硬判定出力は、基地局ＢＳ１から伝送される送信電力制御ビットに対応したものとなり、硬判定部３１５からの硬判定出力は、基地局ＢＳ２から伝送される送信電力制御ビットに対応したものとなる。

最小値選択部３１６は、硬判定部３１４、３１５からの両硬判定出力の値が同じ場合（送信電力増加を表す「１」または送信電力減少を表す「０」である場合）、その硬判定出力の値を送信電力制御信号として出力する。一方、最小値選択部３１６は、硬判定部３１４、３１５からの両硬判定出力の値が異なる場合（送信電力増加を表す「１」及び送信電力減少を表す「０」の場合)、そのうちの小さい値「０」を送信電力制御信号として出力する。

硬判定部３１４からの硬判定出力値が、例えば、

１、０、１、０、０、…

となり、硬判定部３１５からの硬判定出力値が、例えば、

１、１、１、１、１、…

となる場合、最小値選択部３１６は、

１、０、１、０、０、…

を送信電力制御信号として出力する。

上記のような送信電力制御信号決定部３３の構成により、移動局ＭＳでは、各基地局ＢＳ１、ＢＳ２との間の伝送路での伝搬損失が信頼度として考慮され、各基地局ＢＳ１、ＢＳ２から伝送される送信電力制御ビットの軟判定値 TPC-SS1、TPC-SS2 が重み補正される。そして、その重み補正された値の硬判定結果が異なる場合に、より小さい硬判定結果が送信電力制御信号として決定される。そのように決定される送信電力制御信号に基づいて移動局ＭＳの送信電力制御を行うことにより、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の伝送路の状態をより忠実に考慮して移動局ＭＳの無駄のない送信電力制御が可能となる。

次に、図８を参照して上記送信電力制御信号決定部３３の第四の構成例につい

て説明する。なお、図８において、図３に示す部分と同様の部分については同一の参照符号が付されている。

図８において、この送信電力制御信号決定部３３は、２つの TPC 復調部３０１、３０２、４つの硬判定部３１７、３１８、３３１、３３２、最小値選択部３１９及び選択部３３３を有する。上述した各例と同様に、TPC 復調部３０１、３０２は、上記逆拡散部２２、２３（図２参照）からの受信 TPC 信号１及び受信 TPC 信号２を復調し、その復調信号のレベル値を基地局ＢＳ１及びＢＳ２からの送信電力制御ビットの軟判定値 TPC-SS1、TPC-SS2 として出力する。

硬判定部３１７は、所定の閾値を用いて上記 TPC 復調部３０１からの軟判定値 TPC-SS1 の硬判定を行う。この硬判定部３１７からの硬判定出力は、基地局ＢＳ１から伝送される送信電力制御ビットに対応したものとなる。また、硬判定部３１８は、所定の閾値を用いて上記 TPC 復調部３０２からの軟判定値 TPC-SS2 の硬判定を行う。この硬判定部３１８からの硬判定出力は、基地局ＢＳ２から伝送される送信電力制御ビットに対応したものとなる

最小値選択部３１９は、硬判定部３１７、３１８からの両硬判定出力の値が同じ場合、その硬判定出力の値を出力する。一方、硬判定部３１７、３１８からの硬判定出力の値が異なる場合（「０」と「１」の場合）、そのうち小さい値「０」を送信電力制御信号として出力する。

硬判定部３３１は、パイロット信号復調／伝搬損失演算部３１にて演算された伝搬損失１が所定の閾値以上か、及び所定の閾値より小さいかのいずれかの判定結果を硬判定結果として出力する。硬判定部３３２は、パイロット信号復調／伝搬損失演算部３２にて演算された伝搬損失が上記所定の閾値以上か、及び所定の閾値より小さいかのいずれかの判定結果を硬判定結果として出力する。そして、各硬判定部３３１、３３２からの硬判定結果が選択制御信号として選択部３３３に供給される。

選択部３３３は、上記選択制御信号に基づいて基地局ＢＳ１から伝送される送信電力制御ビットに対応した硬判定部３１７の硬判定出力値Ａ、最小選択部３１９からの出力値 MIN 及び基地局ＢＳ２から伝送される送信電力制御ビットに対応した硬判定部３１８の硬判定出力値Ｂのいずれかを選択する。

例えば、伝搬損失１が所定の閾値より小さく、伝搬損失２が所定の閾値以上の場合、硬判定部３３１、３３２から出力される硬判定結果に基づいた選択制御信号により、選択部３３３は、硬判定部３１７の硬判定出力値Ａを選択して送信電力制御信号として出力する。また、伝搬損失１が所定の閾値以上で、伝搬損失２が所定の閾値より小さい場合、硬判定部３３１、３３２から出力される硬判定結果に基づいた選択制御信号により、選択部３３３は、硬判定部３１８の硬判定出力Ｂを選択して送信電力制御信号として出力する。更に、伝搬損失１及び伝搬損失２の双方が所定の閾値より小さい場合、または、その双方が所定の閾値以上の場合、硬判定部３３１、３３２から出力される硬判定結果に基づいた選択制御信号により、選択部３３３は、最小選択部３１９からの出力値 MIN を選択して送信電力制御信号として出力する。

上記のような送信電力制御信号決定部３３の構成により、移動局 ＭＳと各基地局ＢＳ１、ＢＳ２との間の電波伝送路のうち伝搬損失がより小さい値となる電波伝送路を通って伝送される送信電力制御ビットの軟判定値の硬判定結果が送信電力制御信号として決定される。また、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の電波伝送路の伝搬損失が同じように所定の閾値以上、または同じように所定の閾値より小さい場合、基地局ＢＳ１、ＢＳ２から伝送される送信電力制御ビットの軟判定値 TPC-SS1、TPC-SS2 は、同程度の信頼性がある（同程度の信頼性しかない）として、それらの硬判定結果のうち小さい値（「０」）が送信電力制御信号として決定される。

従って、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の伝送路の状態を考慮した無駄のない送信電力制御が可能となる。

次に、図９を参照して上記送信電力制御信号決定部３３の第五の構成例について説明する。なお、図９において、図３及び図６に示す部分と同様の部分については同一の参照符号が付されている。

図９において、送信電力制御信号決定部３３は、図３に示す構成例と同様に、２つの TPC 復調部３０１、３０２、TPC 軟判定値重み合成部３０３及び硬判定部３０４を有している。また、この送信電力制御信号決定部３３は、図６に示す構成例と同様に、２つの TPC 復調部３０１、３０２からの軟判定値 TPC-SS1

、TPC-SS21 のいずれかを選択する選択部３０６、伝搬損失１と伝搬損失２とを比較し、その比較結果を選択制御信号として選択部３０６に供給する比較部３０５及び硬判定部３０７を有している。更に、この送信電力制御信号決定部３３は、硬判定部３０４からの硬判定出力値及び硬判定部３０７からの硬判定出力値のいずれかを選択する選択部３３４を有している。

また、この移動局ＭＳは、フェージング周波数測定部４０及びフェージング判定部４１を有している。フェージング周波数測定部４０は、受信信号のフェージング周波数を測定する。このフェージング周波数は、例えば、復調／合成部２４からの出力信号（合成復調信号）のレベル変動に基づいて測定することができる。また、各拡散チャネルでのパイロット信号の復調信号のレベル変動に基づいて各拡散チャネル毎のフェージング周波数を求めることができる（例えば、本願出願人が既に出願している特願 2000-082929 参照）。この拡散チャネル毎のフェージング周波数の平均値や、その各フェージング周波数のうちでより大きいフェージング周波数をフェージング周波数の測定値として用いることもできる。更に、フェージングによって希望波のレベルが低下すると、受信ＳＩＲが低下し、その受信ＳＩＲを目標ＳＩＲに近づけるように送信電力制御ビットが決定される。従って、このように決定される送信電力制御ビットの変動状況に基づいてフェージング周波数を測定することもできる。

フェージング判定部４１は、上記のようにしてフェージング周波数測定部４０にて測定されたフェージング周波数が基準値以上であるか否かを判定し、その判定結果を選択制御信号として出力する。選択部３３４は、フェージング判定部４１からフェージング周波数の測定値が基準値より小さいとする判定結果に対応した選択制御信号を入力すると、硬判定部３０４からの硬判定出力値を選択して送信電力制御信号として出力する。一方、選択部３３４は、フェージング判定部４１からフェージング周波数の測定値が基準値以上であるとする判定結果に対応した選択制御信号を入力すると、硬判定部３０７からの硬判定出力値を選択して送信電力制御信号として出力する。

このような送信電力制御信号決定部３３の構成により、移動局ＭＳの移動速度が比較的小さく、移動局ＭＳでのフェージング周波数が比較的小さい場合には、

図３に示す例と同様に、各基地局ＢＳ１、ＢＳ２から伝送される送信電力制御ビットの軟判定値 TPC-SS1、TPC-SS2 が、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の電波伝送路での伝搬損失１、２に基づいて重み合成され、その重み合成の結果得られた TPC 合成軟判定値を硬判定した結果が送信電力制御信号として決定される。一方、移動局ＭＳの移動速度が比較的大きく、移動局ＭＳでのフェージング周波数が比較的大きい場合には、図６に示す例と同様に、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の電波伝送路のうち伝搬損失が最小となる電波伝送路を通って伝送される送信電力制御ビットの軟判定値に基づいて送信電力制御信号が決定される。

従って、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の伝送路の状態が比較的良好なとき（フェージング周波数が比較的小さいとき）には、各基地局ＢＳ１、ＢＳ２から伝送される双方の送信電力制御ビットに基づいて移動局ＭＳでの送信電力制御信号が決定される。また、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の伝送路の状態があまり良くないとき（フェージング周波数が比較的大きいとき）には、最も良好な（伝搬損失が最小となる）伝送路を通って伝送される送信電力制御ビットだけに基づいて移動局ＭＳでの送信電力制御信号が決定されることになる。その結果、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間のより良い伝送路の状態を考慮した移動局ＭＳでの送信電力制御が可能となる。

なお、上記例では、図６に示す構成にて得られる送信電力制御信号と、図３に示す構成にて得られる送信電力制御信号とを、フェージング周波数に基づいて切換えるようにしたが、その図６に示す構成にて得られる送信電力制御信号に代えて、図７または図８に示す構成にて得られる送信電力制御信号を用いることもできる。

なお、上記各例では、移動局ＭＳが２つの基地局ＢＳ１、ＢＳ２と無線接続される場合について説明したが、移動局ＭＳが３つ以上の基地局と無線接続される場合についても、同様の処理を行うことにより、移動局ＭＳの送信電力制御を行うことができる。

また、上記各例では、移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の電波伝送路の伝搬損失を考慮して移動局ＭＳにて得られる各基地局からの送信電力制御情

報から送信電力制御に用いられるべき送信電力制御情報を決定している。本発明はこれに限定されず、上記伝搬損失に代えて、各基地局から送信されるパイロット信号に基づいて測定される移動局ＭＳと各基地局ＢＳ１、ＢＳ２との間の伝送路品質を表す情報となるパイロット信号の受信レベルや該パイロット信号から演算される受信ＳＩＲ等を用いることも可能である。その伝送品質を表す情報は、移動局ＭＳが無線接続されるべき基地局を決定するために使用されるものであることが、装置の構成を簡略化できるという観点から好ましい。

上記各例において、パイロット信号復調／伝搬損失演算部３１、３２は、伝搬損失演算手段、伝送路品質測定手段に対応し、送信電力制御信号決定部３３は、送信ン電力制御情報決定手段に対応する。

また、重み係数決定部３１０、重み補正部３１１、３１２は、重み補正手段に対応し、合成部３１３は合成手段に対応し、図９に示す選択部３３４は、選択手段に対応する。

次に、請求の範囲２５～３８の実施例について説明する。

（請求の範囲２５～３８の実施例）

以下、本発明の実施の一形態を図面に基づいて説明する。

本発明の実施の一形態に係る送信電力制御方法が適用される無線通信システムは、例えば、図１０に示すように構成される。この無線通信システムは、移動局と基地局との間で信号の送受信がなされるＣＤＭＡ方式の移動通信システムである。

図１０において、移動局１００と基地局２００とが、ＣＤＭＡ方式に従って信号（パケット、制御信号、音声信号など）の送受信を行う。移動局１００は、送受信装置１１０、信号処理部１５０及びユーザインタフェース１６０を有する。また、基地局２００は、送受信装置２１０及び信号処理部２２０を有する。

移動局１００のユーザインタフェース１６０にてユーザから入力された情報（音声、文書、画像等）は、信号処理部１５０にて所定の形式の信号となるように処理される。信号処理部１５０からの信号は、送受信装置１１０に供給され、符号化処理、変調処理等の所定の処理が施される。そして、その処理により得られた信号が送受信装置１１０から基地局２００に送信される。

移動局１００からの信号を受信した基地局２００の送受信装置２１０は、その受信信号に対して復調処理、復号処理等の所定の処理を施す。そして、送受信装置２１０にて生成された信号が信号処理部２２０にてネットワーク上を伝送可能な形式に変換され、その信号が信号処理部２２０からネットワークを介して通信相手の端末に送信される。

基地局２００において、ネットワークから供給される信号は、信号処理部２２０にて所定の形式となるように処理される。この信号処理部２２０からの信号は、送受信装置２１０に供給され、符号化処理、変調処理等の所定の処理が施される。その処理により得られた信号が送受信装置２１０から移動局１００に送信される。

基地局２００からの信号を受信した移動局１００の送受信装置１１０は、その受信信号に対して復調処理、復号処理等の所定の処理を施す。そして、送受信装置１１０で生成された信号が信号処理部１５０にてユーザインタフェース１６０で処理可能な形式に変換され、その信号に基づいてユーザインタフェース１６０からユーザに対して情報（音声、文書（メール）、画像等）の提示がなされる。

移動局１００の送受信装置１１０は、基地局２００から送信される送信電力制御ビット（電力増加または電力減少を表す送信電力制御情報）に基づいて送信電力制御（上り回線送信電力制御）を行う。基地局２００の送受信装置２１０も、移動局１００から送信される送信電力制御ビットに基づいて送信電力制御（下り回線送信電力制御）を行う。従って、移動局１００及び基地局２００の送受信装置１１０及び２１０は、送信電力制御に関して略同様の構成となっている。以下、上り回線送信電力制御について説明する。

移動局１００の送受信装置１１０は、例えば、図１１に示すように構成される。

図１１において、この送受信装置１１０は、送受分離部１１１を共用した送信系と受信系とを有している。受信系は、無線受信部１１２、誤り訂正符号／誤り検出部１１３、誤り率測定部１１４、ＳＩＲ測定部１１５、ＳＩＲ比較部１１６、目標ＳＩＲ決定部１１７、送信電力制御ビット決定部１１８及び送信電力制御ビット抽出部１１９を有している。

基地局２００から送信される信号が送受分離部１１１を介して無線受信部１１２に供給される。この無線受信部１１２は、送受分離部１１１から供給される受信信号に対して逆拡散処理及び復調処理を施してベースバンド信号を生成する。後述するように、上記受信信号は、基地局２００から送信されるデータに対応したデータ信号と送信電力制御ビットに対応した制御信号とを含んでおり、その制御信号に対する復調処理にて得られたベースバンド信号は、送信電力制御ビット抽出部１１９に供給される。送信電力制御ビット抽出部１１９は、そのベースバンド信号から送信電力制御ビットを復元する。

無線受信部１１２による上記データ信号に対する復調処理にて得られたベースバンド信号は、誤り訂正復号／誤り検出部１１３に供給され、フレーム単位に誤り訂正復号がなされると共に、例えば、CRC（cycle redundancy check）の手法に従って伝送誤りの有無の検出がなされる。その復号結果が情報出力として当該送受信装置１１０から信号処理部１５０（図１０参照）に供給される。この誤り訂正復号／誤り検出部１１３は、更に、フレーム単位毎に上記伝送誤りの有無を表す誤り検出結果を出力する。

誤り率測定部１１４は、上記誤り訂正復号／誤り検出部１１３からの誤り検出結果に基づいて、フレーム誤り率（FER：Frame Error Rate）を受信信号（希望波）から復元した情報の受信品質として演算する。

ＳＩＲ測定部１１５は、無線受信部１１２にて得られた受信信号に基づいて受信ＳＩＲ（希望波対干渉波及び雑音電力比）を演算する。この演算周期は、データのフレーム周期より短い。目標ＳＩＲ決定部１１７は、誤り測定部１１４から出力される情報の受信品質（FER）が目標品質となるように、目標ＳＩＲを決定する。具体的には、この目標ＳＩＲ決定部１１７は、情報の受信品質が目標品質より低ければ、目標ＳＩＲの値を高くし、情報の受信品質が目標品質より高ければ、目標ＳＩＲの値を低くするような制御（アウターループ制御）を行う。ＳＩＲ比較部１１６は、上記ＳＩＲ測定部１１５からの受信ＳＩＲと目標ＳＩＲ決定部１１７からの目標ＳＩＲとを比較し、その比較結果を出力する。

送信電力制御ビット決定部１１８は、ＳＩＲ比較部１１６からの比較結果に基づいて、基地局２００での送信電力制御に用いられるべき送信電力制御ビットを

決定する（インナーループ制御）。受信ＳＩＲが目標ＳＩＲより小さい場合、希望波の受信レベルが低いとして、送信電力制御ビットが送信電力を増加させるべき値（例えば、「１」）に決定される。一方、受信ＳＩＲが目標ＳＩＲより大きい場合、希望波の受信レベルが高いとして、送信電力制御ビットが送信電力を低減させるべき値（例えば、「０」）に決定される。このように値の決定された送信電力制御ビットは、送信電力制御ビット決定部１１８から後述するような送信系の無線送信部１２２に供給され、基地局２００に伝送される。

移動局１００の送信系では、前述したように信号処理部１５０（図１０参照）から供給される情報に対して所定の処理、例えば、CRC の手法に従って誤り検出用のパリティビットをフレーム単位に付加する処理、このような処理により得られたフレーム単位のパリティ付きデータの誤り訂正符号化を行う処理等がなされる。この符号化データは、無線送信部１２２に供給される。

無線送信部１２２は、上記のように供給される符号化データに対して変調処理を行ってデータ変調信号を生成する。また、無線送信部１２２は、前述したように送信電力制御ビット決定部１１８から供給される送信電力制御ビットに対して変調処理を行って制御ビット変調信号を生成し、この制御ビット変調信号と上記データ変調信号とを多重化する。そして、所定の拡散コードを用いてその多重化された信号の拡散処理がなされる。無線送信部１２２は、その拡散処理にて得られた信号を、送受分離部１１１を介して送信する。

この移動局１００の送信系は、更に、送信電力制御部１２３、ＳＩＲ監視部１２４、徐々上げビットパターン生成部１２５及びスイッチ１２６を有している。

上記受信系における送信電力制御ビット抽出部１１９からの送信電力制御ビットは、スイッチ１２６を介して送信電力制御部１２３に供給される。この場合、送信電力制御部１２３は、上記基地局２００からの送信電力制御ビットに基づいて無線送信部１２２での送信電力を制御する。このような制御により、基地局２００での受信ＳＩＲが目標ＳＩＲに近づくように、移動局１００における無線送信部１２２での送信電力制御がなされる。

ＳＩＲ監視部１２４は、前述したＳＩＲ測定部１１５にて測定された受信ＳＩＲ及び目標ＳＩＲ決定部１１７にて決定された目標ＳＩＲを入力し、予め設定さ

れた第一の閾値Ｔｈ$_A$及び第二の閾値Ｔｈ$_B$を用いて上記受信ＳＩＲが正常な状態にあるか否かを監視する。そして、このＳＩＲ監視部１２４は、受信ＳＩＲが正常な状態であると判定すると、第一の状態（例えば、ローレベル）の制御信号を出力する一方、受信ＳＩＲが異常な状態であると判定すると、第二の状態（例えば、ハイレベル）となる制御信号を出力する。

上記ＳＩＲ監視部１２４から第一の状態となる制御信号が出力される場合（受信ＳＩＲが正常な状態)、その制御信号に基づいて上記スイッチ１２６は、送信電力制御ビット抽出部１１９を送信電力制御部１２３に接続する状態となる。その結果、上述したように、送信電力制御ビット抽出部１１９からの送信電力制御ビットが送信電力制御部１２３に供給される。

一方、上記ＳＩＲ監視部１２４から第二の状態となる制御信号が出力される場合（受信ＳＩＲが異常な状態)、その制御信号に基づいて徐々上げビットパターン生成部１２５が起動される。この徐々上げビットパターン生成部１２５は、送信電力が徐々に上昇するように作用する送信電力制御ビット列に対応したビットパターン（以下、徐々上げビットパターンという）を生成する。また、その制御信号に基づいて上記スイッチ１２６は、徐々上げビットパターン生成部１２５を送信電力制御部１２３に接続する状態となる。その結果、徐々上げビットパターン生成部１２５にて生成される徐々上げビットパターンが送信電力制御部１２３に供給される。

上記ＳＩＲ監視部１２４は、例えば、図１２に示すように構成される。

図１２において、ＳＩＲ監視部１２４は、受信ＳＩＲと第一の閾値Ｔｈ$_A$とを比較する比較器１３１、目標ＳＩＲから受信ＳＩＲを減算してＳＩＲ差分値Δ_{SIR}を出力する減算器１３２、減算器１３２から出力されるＳＩＲ差分値Δ_{SIR}と第二の閾値Ｔｈ$_B$とを比較する比較器１３３を有している。上記比較器１３１は、受信ＳＩＲが第一の閾値Ｔｈ$_A$より小さくなるときに、例えば、ハイレベルとなる信号を出力し、受信ＳＩＲが第一の閾値Ｔｈ$_A$以上となるときに、例えば、ローレベルとなる信号を出力する。上記比較器１３３は、上記ＳＩＲ差分値Δ_{SIR}が第二の閾値Ｔｈ$_B$以上となるときに、例えば、ハイレベルとなる信号を出力し、上記ＳＩＲ差分値Δ_{SIR}が第二の閾値Ｔｈ$_B$より小さくなるときに、例えば、

ローレベルとなる信号を出力する。

また、このＳＩＲ監視部１２４は、オアゲート１３４、アップ／ダウンカウンタ１３５及びアンドゲート１３６を有する。上記比較器１３１及び１３３の出力信号がオアゲート１３４に入力され、このオアゲート１３４からの出力信号がアップ／ダウンカウンタ１３５のスタート端子（Ｓ）及びリセット端子（Ｒ）に入力すると共にアンドゲート１３６に入力されている。また、前述した徐々上げビットパターン生成部１２５にて生成される徐々上げビットパターンがアップ／ダウンカウンタ１３５の計数端子（Ｃ）に入力されている。

アップ／ダウンカウンタ１３５は、オアゲート１３４からの出力信号がハイレベルに立ち上がると、リセットされてスタートし、その出力信号をハイレベルに立ち上げる。このアップ／ダウンカウンタ１３５は、徐々上げビットパターンの電力増加を表すビット（例えば、「１」）が入力されると＋１だけアップカウントし、電力減少を表すビット（例えば、「０」）が入力されると－１だけダウンカウントする。そして、その計数値が所定値Ｎに達するとアップ／ダウンカウンタ１３５は、その出力信号をローレベルに立ち下げる。このアップ／ダウンカウンタ１３５の出力信号は上記オアゲート１３４の出力と共にアンドゲート１３６に入力される。このアンドゲート１３６の出力がＳＩＲ監視部１２４の出力となる。

上記徐々上げビットパターンの各ビットの値に応じてアップカウント及びダウンカウントを行うアップ／ダウンカウンタ１３５でのカウント値は、その徐々上げビットパターンにて制御される送信電力の上昇量に対応する。このアップ／ダウンカウンタ１３５に設定される上記所定値Ｎは、徐々上げビットパターンにて制御される送信電力の上昇量の上限に対応したものとなる。

上記のような構成となる移動局１００では、例えば、図１３に示すような送信電力制御（上り回線送信電力制御）がなされる。

図１３において、受信ＳＩＲが目標ＳＩＲを挟む比較的狭い範囲を推移している状態（時刻ｔ1 までの期間）では、受信ＳＩＲは第一の閾値Th_A以上の値となり、目標ＳＩＲと受信ＳＩＲとの差を表すＳＩＲ差分値Δ_{SIR}は第二の閾値Th_Bより小さい値となる。従って、ＳＩＲ監視部１２４における比較器１３１及び１３３の出力は共にローレベルとなって、このＳＩＲ監視部１２４から出力さ

れる制御信号は第一の状態（ローレベル）となる。この制御信号により、スイッチ２６は送信電力制御ビット抽出部１１９を送信電力制御部１２３に接続する状態となり、この送信電力制御ビット抽出部１１９にて抽出される基地局２００からの送信電力制御ビット（…１１１０００１１１１０００）に基づいて送信電力制御部１２３が無線送信部１２２の送信電力制御を行う。この状態は、正常な状態であり、移動局１００での送信電力制御は、基地局２００での受信ＳＩＲが目標ＳＩＲに近づくようになされる。

ここで、何らかの原因で、基地局２００からの受信信号の品質が低下して受信ＳＩＲが低下する（時刻ｔ1 から時刻ｔ2 までの間）。この状態では、受信ＳＩＲと目標ＳＩＲとの関係に基づいて、送信電力制御ビット決定部１１８は、基地局２００の送信電力を上昇させるための送信電力制御ビットを生成し、その送信電力制御ビットが移動局１００から基地局２００に送信されている。それにも係わらず、基地局２００からの受信信号の品質が低下して受信ＳＩＲが第一の閾値Th_Aより小さくなると（時刻ｔ2）、ＳＩＲ監視部１２４における比較器１３１の出力がハイレベルとなり、それに伴って、アップ／ダウンカウンタ１３５が起動され、アップ／ダウンカウンタ１３５の出力信号がハイレベルとなる。その結果、アンドゲート１３６、即ち、ＳＩＲ監視部１２４から第二の状態（ハイレベル）となる制御信号が出力される。

このようにＳＩＲ監視部１２４から出力される制御信号が第二の状態となると、徐々上げビットパターン生成部１２５が起動されると共に、スイッチ１２６がこの徐々上げビットパターン生成部１２５を送信電力制御部１２３に接続する状態に切換わる。それにより、送信電力制御部１２３は、徐々上げビットパターン生成部１２５からの徐々上げビットパターンに基づいて無線送信部１２２の送信電力制御を行う。

上記徐々上げビットパターンが、例えば、（１１１０１１１０１１１）となる場合、所定周期で３回の所定量（例えば、１dB）増加と１回の所定量減少とが交互になされることによって、送信電力は徐々に上昇する。その過程で、移動局１００から送信される送信電力制御ビットの基地局２００での受信品質が改善されると、基地局２００では、移動局１００にて生成された送信電力制御ビットに

基づいた正常な送信電力制御を行うようになる。

このように移動局１００において、基地局２００からの送信電力制御ビットに係わらず、徐々上げビットパターンに基づいた送信電力の自律的な制御がなされることにより、移動局１００のＳＩＲ測定部１１５で測定される受信ＳＩＲが、図１３の点線で示すように更に低下する異常な挙動を示すことなく、徐々に上昇し、時刻ｔ３ で上記第一の閾値Ｔh_A 以上になると、ＳＩＲ監視部１２４における比較器１３１の出力がローレベルに立ち下がる。それにより、ＳＩＲ監視部１２４からの制御信号が第一の状態（ローレベル）に切換わる。すると、スイッチ１２６が送信電力制御ビット抽出部１１９を送信電力制御部１２３に接続する状態に切換わり、送信電力制御部１２３は、上述した正常時と同様に、送信電力制御ビット抽出部１１９にて抽出された基地局２００から送信される送信電力制御ビット（００１１１０００００１１…）に基づいて無線送信部１２２の送信電力制御を行う。

移動局１００では、目標ＳＩＲが受信される情報の品質（FER）に基づいて制御されている（アウターループ制御）。このため、受信ＳＩＲの絶対値だけを監視していても、必ずしもその受信ＳＩＲの異常を検出することができない。このため、この例では、更に、目標ＳＩＲから受信ＳＩＲを減算して得られるＳＩＲ差分値Δ_{SIR}と第二の閾値Ｔh_Bと比較し、その比較結果に基づいて、送信電力制御を行っている。

即ち、受信ＳＩＲが第一の閾値Ｔh_A 以上となる状態であっても、ＳＩＲ差分値Δ_{SIR}が第二の閾値Ｔh_B以上になると、ＳＩＲ監視部１２４の比較器１３２の出力がハイレベルとなり、前述したのと同様に、ＳＩＲ監視部１２４から第二の状態（ハイレベル）となる制御信号が出力される。この第二の状態となる制御信号により、上述したのと同様に、徐々上げビットパターンに基づいた送信電力の自律的な制御がなされる。

また、上記のように徐々上げビットパターンに基づいた送信電力の自律的な制御がなされている過程で、受信ＳＩＲがなかなか改善されない場合、当該受信ＳＩＲが第一の閾値Ｔh_A 以上となる前にＳＩＲ監視部１２４におけるアップ／ダウンカウンタ１３５の計数値が所定値Nに達してしまう。即ち、送信電力の上昇

量が上限に達してしまう。すると、アップ／ダウンカウンタ１３５からの出力信号がローレベルに立下り、ＳＩＲ監視部１２４からの制御信号が第一の状態に切換わる。これにより、上記のような徐々上げビットパターンに基づいた送信電力の自律的な制御が中断され、基地局２００からの送信電力制御ビットに基づいた通常の送信電力制御が行なわれるようになる。

このように、徐々上げビットパターンの各ビットの値に応じてアップカウント及びダウンカウントを行うアップ／ダウンカウンタ１３５の計数値が所定値Ｎに達したときに、その徐々上げビットパターンに基づいた送信電力の自律的な制御を中断することにより、受信ＳＩＲの改善の見込みがない状態での無駄な送信電力の上昇を防止することができる。

上述したような移動局１００での送信電力制御によれば、受信ＳＩＲに基づいて生成される送信電力制御ビットを基地局２００に送信しているにも係わらず、その受信ＳＩＲの改善がなされない場合に、移動局１００での送信電力を徐々に上昇させるようにしているので、基地局２００にて受信される送信電力制御ビットの品質を改善することができるようになる。その基地局２００での受信送信電力制御ビットの品質の改善により、基地局２００での送信電力制御が正常に行なわれるようになり、移動局１００にて測定される受信ＳＩＲが連続して所定の品質（目標ＳＩＲ）より低下することが防止されるようになる。

上述した第一の閾値Ｔh_A及び第二の閾値ＴH_Bは、移動通信システムにおける実際の通信状況等に基づいて実験的に求められた適当な値に設定される。また、アップ／ダウンカウンタ１３５に設定される送信電力の上昇量の上限に対応した所定値Ｎは、受信ＳＩＲの改善特性や無駄のない電力制御などの兼ね合いなどに基づいて定められる。

なお、上記例では、受信ＳＩＲと第一の閾値Ｔh_Aとの比較結果及びＳＩＲ差分値Δ_{SIR}と第二の閾値Ｔh_Bとの比較結果に基づいて受信ＳＩＲが正常であるか否かを判定しているが、いずれか一方の比較結果に基づいて受信ＳＩＲが正常か否かを判定することもできる。特に、目標ＳＩＲを固定値として送信電力制御を行う場合、上記両比較結果のいずれか一方に基づいて受信ＳＩＲの正常性を判定すればよい。

閾値を用いて受信ＳＩＲの正常性を判定する手法は、上述した例に限られず、正常から異常に移行する際の閾値と、異常から正常に復帰する際の閾値を別にすることもできる。また、閾値で区別される状態（正常状態または異常状態）が所定時間継続したときに、その状態であることの最終判定を行うようにしてもよい。更に、閾値を用いた他の一般的な判定手法を用いることができる。

上記の例では、徐々上げビットパターンにより、電力増加及び電力減少を組み合わせて送信電力が徐々に上昇するようにしているが、電力増加と電力を維持するという制御状態を用いて、送信電力を徐々に上昇させることもできる。

上記例では、受信ＳＩＲが改善されるまで送信電力を徐々に上昇させるようにしているが、受信ＳＩＲが異常であると判定されたときに、送信電力を所定量だけ一気に上昇させ、その状態を維持して受信ＳＩＲが所定時間内に改善されるか否かを判定することもできる。この場合、その所定時間内に受信ＳＩＲがある状態まで改善された場合は、通常の送信電力制御に戻す。なお、この場合、受信ＳＩＲが改善されないまま比較的高い送信電力値を維持することによる無駄な制御が行なわれることを防止するという観点から、受信ＳＩＲがある状態まで改善されないまま上記所定時間が経過した場合には、通常の送信電力制御に戻すこともできる。

また、上記例では、徐々上げビットパターンに基づいた送信電力の自律的な制御を行っている過程で、その上昇量が上限に達したとき（アップ／ダウンカウンタ１３５の計数値が所定値Ｎに達したとき）に送信電力制御ビットに基づいた通常の送信電力制御に戻すようにしているが、その時点での送信電力値に固定するようにすることもできる。

上記ＳＩＲ監視部１２４にて用いられる受信ＳＩＲは、上記例では、例えば、各スロット毎に測定される値を用いたが、複数スロットに渡って平均化した値を用いることもできる。

また、移動局１００がソフトハンドオーバにより複数の基地局と無線接続される場合、各基地局から受信信号を合成した合成受信信号に対する受信ＳＩＲに基づいて上述した送信電力制御を行うことができる。

上述した送信電力制御は移動局１００でなされるようにしたが、基地局１００

でなされるようにしてもよい。

上記例において、ＳＩＲ監視部１２４は、品質判定手順（手段）に対応し、徐々上げビットパターン生成部１２５及びスイッチ１２６は、自律制御手順（手段）に対応する。

図１２に示す比較器１３１は、第一の閾値判定手順（手段）に対応し、減算器１３２は差分値演算手順（手段）に対応し、比較器１３３は、第二の閾値判定手順（手段）に対応する。

徐々上げビットパターン生成部１２５は、自律送信電力制御情報を生成する手順（手段）に対応し、スイッチ１２６は、制御切換え手順（手段）に対応する。また、図１２に示すアップ／ダウンカウンタ１３５は、判定手順（手段）に対応し、アンドゲート１３６は、自律制御停止手順（手段）に対応する。

次に、請求の範囲３９～５８の実施例について説明する。

（請求の範囲３９～５８の実施例）

以下、本発明の実施の形態を図面に基づいて説明する。

本発明の実施の一形態に係る送信電力制御方法が適用される移動通信システムは、前述した移動通信システムと同様、図１０に示すように構成される。

図１０において、移動局１００と基地局２００とが、ＣＤＭＡ方式に従って信号（パケット、制御信号、音声信号など）の送受信を行う。移動局１００は、送受信装置１１０、信号処理部１５０及びユーザインタフェース１６０を有する。また、基地局２００は、送受信装置２１０及び信号処理部２２０を有する。

移動局１００のユーザインタフェース１６０にてユーザから入力された情報（音声、文書、画像等）は、信号処理部１５０にて所定の形式の信号となるように処理される。信号処理部１５０からの信号は、送受信装置１１０に供給され、符号化処理、変調処理等の所定の処理が施される。そして、その処理により得られた信号が送受信装置１１０から基地局２００に送信される。

移動局１００からの信号を受信した基地局２００の送受信装置２１０は、その受信信号に対して復調処理、復号処理等の所定の処理を施す。そして、送受信装置２１０にて生成された信号が信号処理部２２０にてネットワーク上を伝送可能な形式に変換され、その信号が信号処理部２２０からネットワークを介して通信

相手の端末に送信される。

基地局２００において、ネットワークから供給される信号は、信号処理部２２０にて所定の形式となるように処理される。この信号処理部２２０からの信号は、送受信装置２１０に供給され、符号化処理、変調処理等の所定の処理が施される。その処理により得られた信号が送受信装置２１０から移動局１００に送信される。

基地局２００からの信号を受信した移動局１００の送受信装置１１０は、その受信信号に対して復調処理、復号処理等の所定の処理を施す。そして、送受信装置１１０で生成された信号が信号処理部１５０にてユーザインタフェース１６０で処理可能な形式に変換され、その信号に基づいてユーザインタフェース１６０からユーザに対して情報（音声、文書（メール）、画像等）の提示がなされる。

移動局１００の送受信装置１１０は、通常、基地局２００から送信される送信電力制御ビット（電力増加または電力減少を表す送信電力制御情報）に基づいて送信電力制御（上り回線送信電力制御）を行う。基地局２００の送受信装置２１０も、移動局１００から送信される送信電力制御ビットに基づいて送信電力制御（下り回線送信電力制御）を行う。

移動局１００の送受信装置１１０は、例えば、図１４に示すように構成される。

図１４において、この送受信装置１１０は、送受分離部１１１を共用した送信系と受信系とを有している。受信系は、無線受信部１１２、誤り訂正復号／誤り検出部１１３、誤り率測定部１１４、ＳＩＲ測定部１１５、ＳＩＲ比較部１１６、目標ＳＩＲ決定部１１７、送信電力制御ビット決定部１１８及び送信電力制御ビット抽出部１１９を有している。

基地局２００から送信される信号が送受分離部１１１を介して無線受信部１１２に供給される。この無線受信部１１２は、送受分離部１１１から供給される受信信号に対して逆拡散処理及び復調処理を施してベースバンド信号を生成する。後述するように、上記受信信号は、基地局２００から送信される情報データに対応したデータ信号と送信電力制御ビットに対応した制御信号とを含んでおり、その制御信号に対する復調処理にて得られたベースバンド信号は、送信電力制御ビ

ット抽出部１１９に供給される。送信電力制御ビット抽出部１１９は、そのベースバンド信号から送信電力制御ビットを復元する。

無線受信部１１２による上記データ信号に対する復調処理にて得られたベースバンド信号は、誤り訂正復号／誤り検出部１１３に供給され、フレーム単位に誤り訂正復号がなされると共に、例えば、CRC（cycle redundancy check）の手法に従って伝送誤りの有無の検出がなされる。その復号結果が情報出力として当該送受信装置１１０から信号処理部１５０（図１０参照）に供給される。この誤り訂正復号／誤り検出部１１３は、更に、フレーム単位毎に上記伝送誤りの有無を表す誤り検出結果を出力する。

誤り率測定部１１４は、上記誤り訂正復号／誤り検出部１１３からの誤り検出結果に基づいて、フレーム誤り率（FER：Frame Error Rate）を受信信号（希望波）から復元した情報の受信品質として演算する。

ＳＩＲ測定部１１５は、無線受信部１１２にて得られた受信信号に基づいて受信ＳＩＲ（希望波対干渉波及び雑音電力比）を演算する。この演算周期は、データのフレーム周期より短い。目標ＳＩＲ決定部１１７は、誤り率測定部１１４から出力される情報の受信品質（FER）が目標品質となるように、目標ＳＩＲを決定する。具体的には、この目標ＳＩＲ決定部１１７は、情報の受信品質が目標品質より低ければ、目標ＳＩＲの値を高くし、情報の受信品質が目標品質より高ければ、目標ＳＩＲの値を低くするような制御（アウターループ制御）を行う。ＳＩＲ比較部１１６は、上記ＳＩＲ測定部１１５からの受信ＳＩＲと目標ＳＩＲ決定部１１７からの目標ＳＩＲとを比較し、その比較結果を出力する。

送信電力制御ビット決定部１１８は、ＳＩＲ比較部１１６からの比較結果に基づいて、基地局２００での送信電力制御に用いられるべき送信電力制御ビットを決定する（インナーループ制御）。受信ＳＩＲが目標ＳＩＲより小さい場合、希望波の受信レベルが低いとして、送信電力制御ビットが送信電力を増加させるべき値（例えば、「１」）に決定される。一方、受信ＳＩＲが目標ＳＩＲより大きい場合、希望波の受信レベルが高いとして、送信電力制御ビットが送信電力を低減させるべき値（例えば、「０」）に決定される。このように値の決定された送信電力制御ビットは、送信電力制御ビット決定部１１８から後述するような送信

系の無線送信部１２２に供給され、基地局２００に伝送される。

上記のような構成の受信系は、更に、同期状態判定部１３０及び閉ループ制御開始タイミング決定部１３５を有している。

移動局１００は、基地局２００に伝送すべきデータを送信するための実質的な上り回線通信を開始する前に、基地局２００との間で所定のフォーマットとなる信号の送受信を行って同期をとるための処理を行う。この同期をとるための処理では、無線受信部１１２は、基地局２００からの信号に基づいて同期引き込みを行い、その同期引き込みにより同期を確立させる。

上記同期状態判定部１３０は、無線受信部１１２での同期引き込みの状態を監視し、同期（上り同期）が確立されたか否かを判定する。この同期が確立されたことが判定されると、同期状態判定部１３０は、同期確立信号を出力する。また、上記閉ループ制御開始タイミング決定部１３５は、タイマ機能を有し、上記同期をとるための処理の過程で、当該送受信装置１１０の送信電力制御を行うために用いられるべき送信電力制御情報を切換えるための切換え制御信号を出力する。なお、この閉ループ制御開始タイミング決定部１３５の機能の詳細は、後述する。

移動局１００の送信系では、前述したように信号処理部１５０（図１０参照）から供給される情報に対して所定の処理、例えば、CRC の手法に従って誤り検出用のパリティビットをフレーム単位に付加する処理、このような処理により得られたフレーム単位のパリティ付きデータの誤り訂正符号化を行う処理等がなされる。このようにして得られた符号化データは、無線送信部１２２に供給される。

無線送信部１２２は、上記のように供給される符号化データに対して変調処理を行ってデータ変調信号を生成する。また、無線送信部１２２は、前述したように送信電力制御ビット決定部１１８から供給される送信電力制御ビットに対して変調処理を行って制御ビット変調信号を生成し、この制御ビット変調信号と上記データ変調信号とを多重化する。そして、所定の拡散コードを用いてその多重化された信号の拡散処理がなされる。無線送信部１２２は、その拡散処理にて得られた信号を、送受分離部１１１を介して送信する。

この移動局１００における送受信装置１１０の送信系は、更に、送信電力制御部１２３、徐々上げビットパターン生成部１２５、スイッチ１２６及び送信開始／停止制御部１２７を有している。

送信電力制御部１２３は、スイッチ１２６を介して供給される送信電力制御ビット抽出部１１９にて抽出された基地局２００からの送信電力制御ビットまたは徐々上げビットパターン生成部１２５にて生成される送信電力制御ビット（以下、徐々上げビットパターンという）に基づいて無線送信部１２２での送信電力を制御する。徐々上げビットパターン生成部１２５にて生成される徐々上げビットパターンは、連続して電力増加を表す送信電力制御ビット（1,1,1,1,…）に基づいて制御される送信電力の変化より緩やかに変化する特性にて送信電力を上昇させるように制御するための送信電力制御ビットとなる。この徐々上げビットパターンは、例えば、電力増加を表す連続した２つのビット「１」と電力減少を表す１つのビット「０」が繰り返し配列されるパターン（1,1,0,1,1,0,1,1,0,…）となる。

前述したように、同期状態判定部１３０から同期確立信号が出力されると、送信開始／停止制御部１２７は、無線送信部１２２に基地局１００での同期処理に必要な所定フォーマットの信号の送信を開始させる。送信開始／停止制御部１２７は、無線送信部１２２に上記所定フォーマットの信号の送信を開始させる際に、送信開始信号①を出力する。閉ループ制御開始タイミング決定部１３５は、送信開始／停止制御部１２７からの送信開始信号①により起動されるタイマを有している。この閉ループ制御開始タイミング決定部１３５は、上記タイマでの計測時間が所定時間に達したか否かを判定し、その計測時間が所定時間に達すると、切換え制御信号を出力する。

当該移動局１００が基地局２００に対する情報データの伝送を開始する前では、スイッチ１２６は、通常、送信電力制御部１２３を徐々上げビットパターン生成部１２５に接続する状態となる。この状態において、電力制御部１２３は、徐々上げビットパターン生成部１２５からの徐々上げビットパターンに基づいて無線送信部１２２の送信電力制御を行う。上記閉ループ制御開始タイミング決定部１３５から切換え制御信号が出力されると、スイッチ１２６は、送信電力制御部１２３を送信電力制御ビット抽出部１１９に接続する状態に切替わる。この状態

において、電力制御部１２３は、送信電力制御ビット抽出部１１９にて抽出される基地局２００からの送信電力制御ビットに基づいて無線送信部１２２の送信電力制御を行う（閉ループ制御）。

なお、基地局２００の送受信装置２１０は、移動局１００の送受信装置１１０と同様に、移動局１００からの受信信号に対する受信ＳＩＲに基づいて送信電力制御ビットを決定し、その送信電力制御ビットを移動局１００に送信する。また、基地局２００の送受信装置２１０は、移動局１００からの送信電力制御ビットに従って送信電力の制御を行う。

上記のような構成の移動通信システムにおいて、基地局２００と移動局１００との間で情報データの伝送が開始される前に、従来のシステムと同様に、基地局２００と移動局１００は、共通制御チャネルを用いて種々の情報の送受信を行い、その後、上記各種の情報に基づいて決められた個別チャネル（拡散符号チャネル）を用いて所定フォーマットとなる信号の送受信を行って、同期をとるための処理を行う。この同期をとるための処理の基本的な手順は、図２１に示すものと同様である。

このような同期をとるための処理の過程で、移動局１００での同期が確立すると（図２１に示す③)、送受信装置１１０の同期状態判定部１３０から出力される同期確立信号に基づいた送信開始／停止制御部１２７の制御により、無線送信部１２２から所定フォーマットの信号の送信が開始される（図２１に示す④)。そして、その信号に対する送信電力制御が、例えば、図１５に示すようになされる。この送信電力制御の開始と同時に、上記同期状態判定部１３０からの送信開始信号①により閉ループ制御開始タイミング決定部１３５のタイマが起動される。

なお、基地局２００は、当初、移動局１００からの送信を受信していない状態で、下り送信を開始しなければならないので（図２１に示す①参照)、例えば、従来のシステムと同様に、連続的に電力増加を表すパターンの送信電力制御ビット（1,1,1,1,…）を送信する。

図１５において、移動局１００での同期が確立して、時刻ｔ1から所定フォーマットの信号が無線送信部１２２から送信される際に、徐々上げビットパターン

生成部１２５からの徐々上げビットパターン（1,1,01,1,0,…）がスイッチ１２６を介して送信電力制御部１２３に供給される。送信電力制御部１２３は、その徐々上げビットパターンに従って、無線送信部１２２の送信電力を、例えば、伝搬損失等に基づいて決められた初期値Ｐ0 から順次上昇させる。この場合、送信電力の上昇特性は、基地局２００からの送信電力制御ビット（1,1,1,1,…）に従った送信電力の変化（二点鎖線参照）より緩やかに変化するものである。

このように送信電力が徐々に上昇されつつ無線送信部１２２から上記所定の信号が送信される過程で、その信号に基づいて基地局２００で同期引き込みがなされ（図２１に示す⑤)、例えば、時刻ｔ21 において基地局２００での同期が確立すると、基地局２００は、上記のような連続的な電力増加を表す送信電力制御ビット（1,1,1,1,…）に代えて、移動局１００からの信号に対する受信ＳＩＲに基づいて決定される送信電力制御ビットの出力を開始する。

上記基地局２００での同期が確立する時刻ｔ21 では、まだ、閉ループ制御開始タイミング決定部１３５は、タイマでの計測時間が所定時間（自律制御期間Ｔs）に達したと判定しないので、電力制御部１２３は、徐々上げビットパターンに従った送信電力制御を継続する。そして、時刻ｔ3 において、閉ループ制御開始タイミング決定部１３５にてタイマでの計測時間が所定時間に達したと判定されると、閉ループ制御開始タイミング決定部１３５から切換え制御信号が出力される。この切換え制御信号により、スイッチ１２６が、送信電力制御部１２３を送信電力制御ビット抽出部１１９に接続する状態に切替わる。以後、当該移動局１００からの信号の受信ＳＩＲに基づいて決定される基地局２００からの送信電力制御ビットに従って無線送信部１２２の送信電力制御（閉ループ制御）がなされる。

このような基地局２００からの送信電力制御ビットに従って無線送信部１２２の送信電力が制御されることにより、上記時刻ｔ3 以後の送信電力は、徐々に低下し、基地局２００での受信ＳＩＲが目標ＳＩＲに維持され得る適正な値に維持されるようになる。このような状態において、所定のタイミングにて、移動局１００の送受信装置１１０は、伝送すべきデータを含めた信号を送信するための実質的な上り回線通信を開始する。

上述したような基地局２００と移動局１００との間で情報データの伝送が開始される前における移動局１００での送信電力制御によれば、移動局１００での同期が確立した後に、当該移動局１００から信号を送信する際に徐々上げビットパターン（1,1,0,1,1,0,…）に従って送信電力の制御がなされるので、送信電力が、従来のシステムのように急激に上昇することが防止される。また、このような徐々上げビットパターンに従った送信電力制御であっても、基地局２００での受信品質（受信ＳＩＲ）が所望の品質（目標ＳＩＲ）に維持できる程度の送信電力値には比較的早期に達するので、基地局２００での同期も比較的早期に確立することができる。

上記閉ループ制御開始タイミング決定部１３５のタイマに設定される所定時間は、上記徐々上げビットに従った送信電力制御がなされつつ移動局１００から送信される信号に基づいて基地局２００で同期の確立に要すると予想される時間に基づいて決められる。通常、その所定時間は、その予想される時間より僅かに長い時間に設定される。しかし、移動局１００と基地局２００との間の伝送路の状態によっては、基地局２００での同期の確立に上記所定時間より長い時間を要してしまう場合がある。

このような場合、図１５に示すように、徐々上げビットパターンに従った送信電力制御から基地局２００からの送信電力制御ビットに従った送信電力に切換えられる時刻ｔ3 から基地局２００での同期が実際に確立される時刻ｔ22 までの間は、基地局２００からの連続して電力増加を表す送信電力制御ビット（1,1,1,1,…）に従って送信電力制御がなされる。この場合、時刻ｔ3 から時刻ｔ22 まで、送信電力は上昇するが、通常は、時刻ｔ3 と時刻ｔ22 との間の時間は僅かであるので、移動局１００で費やされる送信電力の増分も比較的少なくて済む（図１５における点線で示す特性参照)。

一方、時刻ｔ3 から時刻ｔ22 との間の時間が長くなる場合は、基地局１００と移動局２００との間の伝送路の状態が極めて良くない状態である。このような状態では、基地局２００での同期を確立するために、本来、移動局１００の送信電力を十分大きな値に制御しなければならないので、この時刻ｔ3 と時刻ｔ22 の間でなされる連続して電力増加を表す送信電力制御ビットに従った送信電力制

御は、無駄なものではない。

上記閉ループ制御開始タイミング決定部１３５は、例えば、図１６に示す手順に従って送信電力制御を切換えるための切換え制御信号を出力することもできる。この例では、図１４に示すように、閉ループ制御開始タイミング決定部１３５は、上記送信開始／停止制御部１２７からの送信開始信号①と共に、送信電力制御ビット抽出部１１９にて抽出される基地局２００からの送信電力制御ビット②の状態に基づいて送信電力制御の切換えタイミングを決定している。

また、閉ループ制御開始タイミング決定部１３５による図１６に示す手順に従った処理により、移動局２００の無線送信部１２２の送信電力は、例えば、図１７に示すように変化する。

図１６において、上記送信開始信号①に基づいて無線送信部１２２から基地局２００での同期を確立するために用いられる信号の送信の開始（上り送信開始：図２１に示す④参照）が認識されると（Ｓ１）、タイマＴが起動される（Ｓ２）。そして、そのタイマＴでの計測時間が所定時間Ｔ0 に達したか否かが判定される（Ｓ３）。このタイマＴの計測時間が所定時間Ｔ0 に達していない状態（Ｓ３でＮＯ）では、前述した例と同様に、送信電力制御部１２３は、徐々上げビットパターン生成部１２５からの徐々上げビットパターンに従って無線送信部１２２の送信電力を制御する。その結果、無線送信部１２２の送信電力は、上記徐々上げビットパターンに従って比較的緩やかな特性にて徐々に上昇する。

このような状態で、例えば、図１７に示す時刻ｔ2 において、上記タイマＴの計測時間が所定時間Ｔ0 に達すると、カウンタｎがゼロにリセットされ（Ｓ４）、その後、そのカウンタｎが＋１だけインクリメントされる（Ｓ５）。そして、閉ループ制御開始タイミング決定部１３５は、送信電力制御ビット抽出部１１９にて抽出された基地局２００からの単一の送信電力制御ビットの値Ｂｎ（１または０であり、以下、TPC ビット値という）を取得する（Ｓ６）。そして、そのTPC ビット値Ｂｎを用いて、移動平均値Ａｎが

【数１】

$$A_n = \frac{1}{n_0}\{(n_0 - 1)A_{n-1} + B_n\} \qquad \cdots (1)$$

に従って演算される（Ｓ８）。

カウンタ値ｎが所定値ｎ0 に達するまで（Ｓ８参照）、カウンタｎのインクリメント（Ｓ５）、TPC ビット値Ｂｎ の取得（Ｓ６）、移動平均値Ａｎ の演算（Ｓ７）が繰り返し実行される。そして、カウンタ値ｎが所定値ｎ0 に達すると（Ｓ８でＹＥＳ）、その時点で得られる移動平均値Ａｎ は、連続するｎ0 個の TPC ビット値Ｂ1～Ｂn0 の平均値となる。TPC ビット値は、１または０であり、その移動平均値Ａｎ は、その平均値演算（上記式（１）参照）に供される１となる TPC ビット値の数と０となる TPC ビット値の数の割合を反映させた値となる。

即ち、基地局２００で同期が確立していない状態では、全て「１」となる送信電力制御ビットが基地局２００から出力されるので、その移動平均値Ａｎ は、理想的には１となる。一方、基地局２００での同期が確立した直後では、移動局２００からの信号の受信品質（受信ＳＩＲ）に基づいて決定される送信電力制御ビットが基地局２００から出力されるので、TPC ビット値Ｂｎ は０となる割合が高くなり、その移動平均値Ａｎは、１より小さくなる。

従って、上記のようにカウンタ値ｎが所定値ｎ0 を超えると、TPC ビット値Ｂｎ の移動平均値Ａｎ が基準値α（０＜α＜１）以下であるか否かが判定される（Ｓ９）。そして、その移動平均値Ａｎ がその基準値α以下となるまで、取得される TPC ビット値Ｂｎを用いて移動平均値Ａｎ が演算される（Ｓ６、Ｓ７）。

そのような処理（Ｓ５、Ｓ６、Ｓ７、Ｓ８、Ｓ９）を繰り返し実行する過程で、例えば、図１７に示す時刻ｔ3 で基地局２００での同期が確立すると、それ以後、基地局２００から０となる送信電力制御ビットが送信される頻度が高くなり

、図１７に示す時刻ｔ4 で、その移動平均値An が基準値αＩＩ以下になると（Ｓ９でＹＥＳ）、閉ループ制御開始タイミング決定部１３５は、切換え制御信号を出力する（Ｓ１０）。

この切換え制御信号によりスイッチ１２６は、送信電力制御部１２３に送信電力制御ビット抽出部１１９を接続する状態となり、送信電力制御部１２３は、送信電力制御ビット抽出部１１９にて抽出される基地局２００からの送信電力制御ビットに基づいて無線送信部１２２の送信電力制御を行う。従って、図１７に示す時刻ｔ4 以降では、無線送信部１２２の送信電力は順次低下し、移動局１００の基地局２００での受信ＳＩＲが目標ＳＩＲに維持できる程度の送信電力値に制御されるようになる。

上記の例では、基地局２００での同期が確立する前には、当該基地局２００から全て「１」となる送信電力制御ビットが送信され、同期が確立した後には、当該基地局２００から移動局１００からの信号の受信品質（受信ＳＩＲ）に基づいて決定された送信電力制御ビット（閉ループ送信電力制御ビット）が送信されることを利用し、閉ループ制御開始タイミング決定部１３５が基地局２００での同期が確立したか否かを判定している。即ち、閉ループ制御開始タイミング決定部１３５は、基地局２００から送信される送信電力制御ビットが、全て「１」となるパターンから「０」と「１」が混在するパターンに変わったことを検出することにより、基地局２００での同期が確立したことを検出する。

また、上記のように基地局２００から１となる送信電力制御ビットの数と０となる送信電力制御ビットの数との割合に基づいて、徐々上げパターンに従った送信電力の終了タイミングを判定するだけでなく、０となる送信電力制御ビットの所定の期間の累計値に基づいて判定することもできる。

なお、図１７において、時刻ｔ2 から時刻ｔ4 までの時間が、図１６に示すＳ５～Ｓ９の処理を繰り返し実行している期間（監視期間Ｔｗ）となる。この監視期間Ｔｗ では、基地局２００からの送信電力制御ビットが監視されると共に、徐々上げビットパターンに従って無線送信機１２２の送信電力制御が行なわれる。

また、上記基地局２００からの送信電力制御ビットの監視は、移動局１００か

らの信号の送信が開始された時刻ｔ2 から開始することもできる。しかし、上記例では、移動局１００からの信号の送信が開始された時刻ｔ2 から所定時間Ｔ0は、上述したような送信電力制御の監視がなされない。このため、この期間で、送信電力制御ビットの受信誤りがあっても、その誤りビットは上記監視の対象にはならない。送信電力制御ビットのパターンの変化が見込まれる期間だけ当該送信電力ビットの監視を行えばよいので、移動局１００での処理の負担が低減される。

移動局１００の送受信装置１１０は、例えば、図１８に示すように構成することもできる。この例では、移動局１００での同期が確立して当該移動局１００から所定フォーマットの信号を基地局２００に送信する際に、基地局２００から送信される送信電力制御ビットに基づいてこの送信電力制御ビットによる送信電力の変化より緩やかに変化する特性に従って送信電力を制御するための送信電力制御情報（以下、1/N 送信電力制御ビットという）を生成する。そして、その 1/N 送信電力制御ビットに従って移動局１００の送信電力を制御するようにしている。なお、図１８において、図１４と同様の部位には同じ参照番号が付されている。

図１８において、この送受信装置１１０は、前述した例と同様に、送受分離部１１１を共用する受信系及び送信系を有する。当該受信系は、前述した例と同様に、無線受信部１１２、誤り訂正復号／誤り検出部１１３、誤り率測定部１１４、ＳＩＲ測定部１１５、ＳＩＲ比較部１１６、目標ＳＩＲ決定部１１７、送信電力制御ビット決定部１１８、送信電力制御ビット抽出部１１９及び同期状態判定部１３０を有している。また、上記送信系は、前述した例と同様に、無線送信部１２２及び送信開始／停止制御部１２７を有している。

送信系は、更に、送信電力制御部１２３ａ、1/N 送信電力制御部１２３ｂ、制御切換えスイッチ１２８を有している。制御切換えスイッチ１２８は、所定の制御部（図示略）からの切換え制御信号によって、無線送信部１２２を 1/N 送信電力制御部１２３ｂに接続する状態から、無線送信部１２２を送信電力制御部１２３ａに接続する状態に切替わる。送信電力制御部１２３ａは、送信電力制御ビット抽出部１１９にて抽出される基地局２００からの送信電力制御ビットがスイ

ッチ１２８を介して供給されると、その送信電力制御ビットに基づいて無線送信部１２２の電力制御を行う。各送信電力制御ビットは、１スロットに割当てられており、送信電力制御部１２３ａは、その送信電力制御ビットに従って、無線送信部１２２の送信電力をスロット毎に更新する。

1/N 送信電力制御部１２３ｂは、送信電力制御ビット抽出部１１９にて抽出される基地局２００からの送信電力制御ビットをＮビット（例えば、３ビット）ずつ走査し、その中で最も多い値となる代表ビット（以下、1/N 送信電力制御ビットという）を決める。そして、1/N 送信電力制御部１２３ｂは、その 1/N 送信電力制御ビットに従ってＮスロット毎に無線送信部の送信電力を更新する。

例えば、図１９に示すように、移動局１００での同期が確立し、無線送信部１２２から所定フォーマットの信号の送信が時刻ｔ１で開始されると、1/N 送信電力制御部１２３ｂが、送信電力制御ビットから生成される 1/N 送信電力制御ビットに基づいて無線送信部１２２の送信電力を初期値から、３スロット（Ｎ＝３）毎に更新する。

例えば、図１９に示すように、送信電力制御ビットが、

１１１１１１０１１１１１０１１１１１０００００００１１１００１１

となる場合、

1/N 送信電力制御ビットは、

・１・・１・・１・・１・・１・・１・・０・・０・・０・・１・・１…

となる。

このような 1/N 送信電力制御ビットに基づいて３スロット毎に更新されるように制御される送信電力は、元の送信電力制御ビットに基づいて各スロット毎に更新されるように制御される送信電力より緩やかに変化する（図１９における点線の特性、及び実線の特性参照）。従って、無駄な電力消費を行うことなく、基地局２００での同期を確立させることができるようになる。

このように送信電力制御がなされつつ移動局１００から送信される信号に基づいて、例えば、図１９に示す時刻ｔ2 において、基地局２００での同期が確立すると、以後、基地局２００は、移動局１００からの信号の受信品質（受信ＳＩＲ）に基づいて決められる送信電力制御ビットを送信する。

移動局１００では、1/N 送信電力制御部１２３ｂが、送信電力制御ビット抽出部１１９にて抽出される上記送信電力制御ビットから前述した手法に従って 1/N 送信電力制御ビットを決定し、その 1/N 送信電力制御ビットに基づいて上記と同様の送信電力制御を継続する。そして、予め定めた所定のタイミングになると（図１９における時刻ｔ3)、所定の制御部からの切換え制御信号により、制御切換えスイッチ１２８は、無線送信部１２２を送信電力制御部１２３ａに接続する状態に切替わる。

それにより、送信電力制御部１２３ａは、送信電力制御ビット抽出部１１９にて抽出される基地局２００からの送信電力制御ビットに基づいて無線送信部１２２の送信電力をスロット毎に更新する。

基地局２００での同期が確立した後（時刻ｔ2 以後)、移動局１００からの信号の基地局２００での受信品質（受信ＳＩＲ）が安定してくると、その受信信号品質と目標品質との差に基づいて決定される送信電力制御ビットに従った送信電力制御後の送信電力の変動幅は比較的小さいものとなる。このような状態では、基地局２００からの送信電力制御ビットに基づいて各スロット毎に更新される送信電力の変動と、1/N 送信電力制御ビットに基づいて３スロット毎に更新される送信電力の変動との差は大きくならない(図１９における時刻ｔ2 以降の実線及び破線の変動参照)。従って、上記 1/N 送信電力制御ビットに基づいた送信電力制御から元の送信電力制御ビットに基づいた送信電力制御への切換えタイミング（時刻ｔ3）は、比較的ラフに、かつ遅目に設定することができる。

上記例では、送信電力制御ビットをＮビットずつ走査して、その中で最も多い値となるビットを 1/N 送信電力制御ビットとして決めているが、そのＮビット毎の平均値等に基づいて決めることもできる。

上記各例において、徐々上げビットパターンに従った送信電力制御は、自律制御手順（手段）に対応し、閉ループ制御開始タイミング決定部１３５は、自律制御停止条件判定手順（手段）に対応し、スイッチ１２６は、制御切換え手順（手段）に対応する。

また、図１８に示す 1/N 送信電力制御部１２３ｂは、緩特性送信電力制御手順（手段）に対応し、図１８に示す切換え制御信号を出力する所定の制御部は、

緩特性送信電力制御停止判定手順（手段）に対応し、図１８に示す制御切換えスイッチ１２８は、制御切換え手順（手段）に対応する。

請 求 の 範 囲

１． 移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御装置において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の電波伝送路での伝搬損失を演算する伝搬損失演算手段と、

移動局にて得られる各基地局からの送信電力制御情報と、上記伝搬損失演算手段にて演算された各基地局と移動局との間の電波伝送路の伝搬損失とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手段とを有する送信電力制御装置。

２．請求項１記載の送信電力制御装置において、

上記送信電力制御情報決定手段は、移動局との間の電波伝送路の伝搬損失がより小さい基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、

該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段とを有し、

該合成手段にて得られた合成送信電力制御情報に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御装置。

３．請求項２記載の送信電力制御装置において、

上記各基地局から送信される送信電力制御情報は、電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報であると共に、移動局が各基地局からの送信電力制御情報を軟判定値として取得し、

上記送信電力制御情報決定手段は、上記合成手段にて得られた合成送信電力制御情報の値を所定の閾値を用いて硬判定する硬判定手段を有し、その硬判定結果

に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御装置。

４．請求項３記載の送信電力制御装置において、

上記硬判定手段にて用いられる上記所定の閾値は、各基地局から送信される送信電力制御情報が取り得る第一の値と第二の値との中間値より所定量だけ第一の値寄りの値となる送信電力制御装置。

５．請求項２記載の送信電力制御装置において、

上記各基地局から送信される送信電力制御情報は、電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報であると共に、移動局が各基地局からの送信電力制御情報を軟判定値として取得し、

上記送信電力制御情報決定手段は、上記合成手段にて得られた合成送信電力情報の値を第一の閾値を用いて硬判定する第一の硬判定手段と、

上記合成送信電力制御情報の値を上記第一の閾値と異なる第二の閾値を用いて硬判定する第二の硬判定手段と、

上記第一の硬判定手段での判定結果及び上記第二の硬判定手段での判定結果に基づいて、電力増加の制御状態を表す第一の制御情報、電力減少の制御状態を表す第二の制御情報及び電力維持の制御状態を表す第三の制御情報のいずれかを生成する制御情報生成手段とを有し、

該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するようにした送信電力制御装置。

６．請求項１記載の送信電力制御装置において、

上記送信電力制御情報決定手段は、移動局にて得られる各基地局からの送信電力制御情報から、上記伝搬損失演算手段にて演算された移動局との間の電波伝送路の伝搬損失が最小となる基地局からの送信電力制御情報を選択する選択手段を有し、

該選択手段にて選択された送信電力制御情報に基づいて移動局の送信電力制御

に用いられるべき送信電力制御情報を決定するようにした送信電力制御装置。

７．請求項６記載の送信電力制御装置において、

上記各基地局から送信される送信電力制御情報は、電力増加の制御状態を表す第一の値及び電力減少の制御状態の第二の値を取り得る情報であると共に、移動局が各基地局からの送信電力制御情報を上記値の軟判定値として取得し、

上記送信電力制御情報決定手段は、上記選択手段にて選択された送信電力制御情報の値を所定の閾値を用いて硬判定する硬判定手段を有し、その硬判定結果に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御装置。

８．請求項７記載の送信電力制御装置において、

上記硬判定手段にて用いられる上記所定の閾値は、各基地局から送信される送信電力制御情報が取り得る第一の値と第二の値との中間値より所定量だけ第一の値寄りの値となる送信電力制御装置。

９．請求項６記載の送信電力制御装置において、

上記各基地局から送信される送信電力制御情報は、電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報であると共に、移動局が各基地局からの送信電力制御情報を軟判定値として取得し、

上記送信電力制御情報決定手段は、上記選択手段にて選択された送信電力情報の値を第一の閾値を用いて硬判定する第一の硬判定手段と、

上記選択された送信電力制御情報の値を上記第一の閾値と異なる第二の閾値を用いて硬判定する第二の硬判定手段と、

上記第一の硬判定手段での判定結果及び上記第二の硬判定手段での判定結果に基づいて、電力増加の制御状態を表す第一の制御情報、電力減少の制御状態を表す第二の制御情報及び電力維持の制御状態を表す第三の制御情報のいずれかを生成する制御情報生成手段とを有し、

該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いら

れるべき送信電力制御情報として決定する送信電力制御装置。

１０．請求項１記載の送信電力制御装置において、

上記送信電力制御情報決定手段は、移動局との間の電波伝送路の伝搬損失がより小さい基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、

重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報のうちから電力減少の制御状態を表す送信電力制御情報により近い補正情報が優先されるように決められた重み補正制御情報に基づいて制御情報を生成する制御情報生成手段とを有し、

該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するようにした送信電力制御装置。

１１．請求項１０記載の送信電力制御装置において、

上記各基地局から送信される送信電力制御情報は、電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報であると共に、移動局が各基地局からの送信電力制御情報を軟判定値として取得し、

上記制御情報生成手段は、上記重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報の値を所定の閾値を用いて硬判定する硬判定手段と、

各基地局からの送信電力制御情報に対応した硬判定結果のいずれかを電力減少の制御状態を表す硬判定結果が優先されるように選択する選択手段とを有し、該選択手段にて選択された硬判定結果に基づいて制御情報を生成するようにした送信電力制御装置。

１２．請求項１記載の送信電力制御装置において、

上記送信電力制御決定手段は、上記伝搬損失演算手段にて演算された各伝搬損失が所定の伝搬損失より小さいか否かを判定する伝搬損失判定手段と、

該伝搬損失判定手段にて上記所定の伝搬損失より小さいと判定された伝搬損失が１つである場合、その判定された伝搬損失に対応した基地局からの送信電力制御情報に基づいて制御情報を生成し、上記伝搬損失判定手段にて上記所定の伝搬損失より小さいと判定された伝搬損失が複数となる場合、その複数の伝搬損失に対応した各基地局からの送信電力制御情報のうちから電力減少の制御状態を表す送信電力制御情報により近い送信電力制御情報が優先されるように決められた送信電力制御情報に基づいて制御情報を生成し、更に、上記伝搬損失判定手段にて全ての伝搬損失が上記所定の伝搬損失より小さくないと判定された場合、各基地局からの送信電力制御情報のうちから電力減少の制御状態を表す送信電力制御情報により近い送信電力制御情報が優先されるように決められた送信電力制御情報に基づいて制御情報を生成する制御情報生成手段とを有し、

該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するようにした送信電力制御装置。

１３．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御装置において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の電波伝送路での伝搬損失を演算する伝搬損失演算手段と、

移動局でのフェージングの状態を測定するフェージング測定手段と、

該フェージング測定手段にて測定された移動局でのフェージングの状態が所定の状態より良好であるか否かを判定するフェージング状態判定手段と、

該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好であると判定されたときに第一の送信電力制御情報決定手段を有効にし、該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好でないと判定されたときに第二の送信電力制御情報決定手段を有効にする切換え制御手段とを有し、

上記第一の送信電力制御情報決定手段は、移動局との間の電波伝送路の伝搬損

失がより小さい基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、

該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段とを有し、

該合成手段にて得られた合成送信電力制御情報に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにし、

上記第二の送信電力制御情報決定手段は、移動局にて得られる各基地局からの送信電力制御情報から、上記伝搬損失演算手段にて演算された移動局との間の電波伝送路の伝搬損失が最小となる基地局からの送信電力制御情報を選択する選択手段を有し、

該選択手段にて選択された送信電力制御情報に基づいて移動局での送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御装置。

１４．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御装置において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局が無線接続すべき基地局を決定するために用いられる移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手段と、

移動局にて得られる各基地局からの送信電力制御情報と、上記伝送路品質測定手段にて得られた移動局と各基地局との間の伝送路品質とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手段とを有する送信電力制御装置。

１５．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報となる送信電力制御情報を移動

局に送信した際に移動局にて得られる各基地局からの送信電力制御情報の軟判定値に基づいて移動局の送信電力を制御する送信電力制御装置において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手段と、

移動局にて得られる各基地局からの送信電力制御情報の軟判定値と、上記伝送路品質測定手段にて測定された各基地局と移動局との間の伝送路品質に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手段とを有し、

該送信電力制御手段は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報の軟判定値に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、

該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段と、

該合成手段にて得られた合成送信電力制御情報の値を、各基地局から送信される送信電力制御情報が取り得る第一の値と第二の値との中間値より所定量だけ第一の値寄りの値となる閾値を用いて硬判定する硬判定手段とを有し、

その硬判定結果に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御装置。

１６．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報となる送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報の軟判定値に基づいて移動局の送信電力を制御する送信電力制御装置において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手段と、

移動局にて得られる各基地局からの送信電力制御情報の軟判定値と、上記伝送路品質測定手段にて測定された各基地局と移動局との間の伝送路品質に基づいて

移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手段とを有し、

該送信電力制御手段は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報の軟判定値に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、

該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段と、

該合成手段にて得られた合成送信電力制御情報の値を第一の閾値を用いて硬判定する第一の硬判定手段と、

上記合成送信制御情報の値を上記第一の閾値と異なる第二の閾値を用いて硬判定する第二の硬判定手段と、

上記第一の硬判定手段での判定結果及び第二の硬判定手段での判定手段に基づいて、電力増加の制御情報を表す第一の制御情報、電力減少の制御状態を表す第二の制御情報及び電力維持の制御状態を表す第三の制御情報のいずれかを生成する制御情報生成手段とを有し、

該制御情報生成手段にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するようにした送信電力制御装置。

１７．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御装置において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手段と、

移動局でのフェージングの状態を測定するフェージング測定手段と、

該フェージング測定手段にて測定された移動局でのフェージングの状態が所定の状態より良好であるか否かを判定するフェージング状態判定手段と、

該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態

より良好であると判定されたときに第一の送信電力制御情報決定手段を有効にし、該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好でないと判定されたときに第二の送信電力制御情報決定手段を有効にする切換え制御手段とを有し、

上記第一の送信電力制御情報決定手段は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手段と、

該重み補正手段にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手段とを有し、

該合成手段にて得られた合成送信電力制御情報に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにし、

上記第二の送信電力制御情報決定手段は、移動局にて得られる各基地局からの送信電力制御情報から、上記伝送路品質測定手段にて測定された移動局との間の伝送路品質が最良となる基地局からの送信電力制御情報を選択する選択手段を有し、

該選択手段にて選択された送信電力制御情報に基づいて移動局での送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御装置。

１８．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御方法において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の電波伝送路での伝搬損失を演算する伝搬損失演算手順と、

移動局にて得られる各基地局からの送信電力制御情報と、上記伝搬損失演算手順にて演算された各基地局と移動局との間の電波伝送路の伝搬損失とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手順とを有する送信電力制御方法。

１９．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御方法において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の電波伝送路での伝搬損失を演算する伝搬損失演算手順と、

移動局でのフェージングの状態を測定するフェージング測定手順と、

該フェージング測定手段にて測定された移動局でのフェージングの状態が所定の状態より良好であるか否かを判定するフェージング状態判定手順と、

該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好であると判定されたときに第一の送信電力制御情報決定手順を有効にし、該フェージング状態判定手段にて移動局でのフェージングの状態が所定の状態より良好でないと判定されたときに第二の送信電力制御情報決定手順を有効にする切換え制御手順とを有し、

上記第一の送信電力制御情報決定手順は、移動局との間の電波伝送路の伝搬損失がより小さい基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手順と、

該重み補正手順にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手順とを有し、

該合成手段にて得られた合成送信電力制御情報に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにし、

上記第二の送信電力制御情報決定手順は、移動局にて得られる各基地局からの送信電力制御情報から、上記伝搬損失演算手順にて演算された移動局との間の電波伝送路の伝搬損失が最小となる基地局からの送信電力制御情報を選択する選択手順を有し、

該選択手順にて選択された送信電力制御情報に基づいて移動局での送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御方法。

２０．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御方法において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局が無線接続すべき基地局を決定するために用いられる移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手順と、

移動局にて得られる各基地局からの送信電力制御情報と、上記伝送路品質測定手順にて得られた移動局と各基地局との間の伝送路品質とに基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手順とを有する送信電力制御方法。

２１．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報となる送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報の軟判定値に基づいて移動局の送信電力を制御する送信電力制御方法において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手順と、

移動局にて得られる各基地局からの送信電力制御情報の軟判定値と、上記伝送路品質測定手順にて測定された各基地局と移動局との間の伝送路品質に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手順とを有し、

該送信電力制御手順は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報の軟判定値に対して重み付けを行って重み補正制御情報を生成する重み補正手順と、

該重み補正手順にて得られた各基地局からの送信電力制御情報に対応した該重

み補正制御情報を合成して合成送信電力制御情報を生成する合成手順と、

該合成手順にて得られた合成送信電力制御情報の値を、各基地局から送信される送信電力制御情報が取り得る第一の値と第二の値との中間値より所定量だけ第一の値寄りの値となる閾値を用いて硬判定する硬判定手順とを有し、

その硬判定結果に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御方法。

２２．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した電力増加の制御状態を表す第一の値及び電力減少の制御状態を表す第二の値を取り得る情報となる送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報の軟判定値に基づいて移動局の送信電力を制御する送信電力制御方法において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手順と、

移動局にて得られる各基地局からの送信電力制御情報の軟判定値と、上記伝送路品質測定手順にて測定された各基地局と移動局との間の伝送路品質に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定する送信電力制御情報決定手順とを有し、

該送信電力制御手順は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報の軟判定値に対して重み付けを行って重み補正制御情報を生成する重み補正手順と、

該重み補正手順にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手順と、

該合成手順にて得られた合成送信電力制御情報の値を第一の閾値を用いて硬判定する第一の硬判定手順と、

上記合成送信制御情報の値を上記第一の閾値と異なる第二の閾値を用いて硬判定する第二の硬判定手順と、

上記第一の硬判定手段での判定結果及び第二の硬判定手段での判定手段に基づ

いて、電力増加の制御情報を表す第一の制御情報、電力減少の制御状態を表す第二の制御情報及び電力維持の制御状態を表す第三の制御情報のいずれかを生成する制御情報生成手順とを有し、

該制御情報生成手順にて生成された制御情報を移動局の送信電力制御に用いられるべき送信電力制御情報として決定するようにした送信電力制御方法。

２３．移動通信システムにおいて移動局と無線接続される複数の基地局のそれぞれが受信信号品質に基づいて決定した送信電力制御情報を移動局に送信した際に移動局にて得られる各基地局からの送信電力制御情報に基づいて移動局の送信電力を制御する送信電力制御方法において、

各基地局から固定的な送信電力にて送信される所定の信号に基づいて移動局と各基地局との間の伝送路品質を測定する伝送路品質測定手順と、

移動局でのフェージングの状態を測定するフェージング測定手順と、

該フェージング測定手段にて測定された移動局でのフェージングの状態が所定の状態より良好であるか否かを判定するフェージング状態判定手順と、

該フェージング状態判定手順にて移動局でのフェージングの状態が所定の状態より良好であると判定されたときに第一の送信電力制御情報決定手順を有効にし、該フェージング状態判定手順にて移動局でのフェージングの状態が所定の状態より良好でないと判定されたときに第二の送信電力制御情報決定手順を有効にする切換え制御手順を有し、

上記第一の送信電力制御情報決定手順は、移動局との間の伝送路品質がより良好な基地局からの送信電力制御情報に対する重みがより大きくなるように、移動局にて得られる各基地局からの送信電力制御情報に対して重み付けを行って重み補正制御情報を生成する重み補正手順と、

該重み補正手順にて得られた各基地局からの送信電力制御情報に対応した該重み補正制御情報を合成して合成送信電力制御情報を生成する合成手順とを有し、

該合成手順にて得られた合成送信電力制御情報に基づいて移動局の送信電力制御に用いられるべき送信電力制御情報を決定するようにし、

上記第二の送信電力制御情報決定手順は、移動局にて得られる各基地局からの

送信電力制御情報から、上記伝送路品質測定手順にて測定された移動局との間の伝送路品質が最良となる基地局からの送信電力制御情報を選択する選択手順を有し、

該選択手順にて選択された送信電力制御情報に基づいて移動局での送信電力制御に用いられるべき送信電力制御情報を決定するようにした送信電力制御方法。

２４．移動通信システムにおいて複数の基地局と無線接続され得る移動局において、

複数の基地局からの信号を合成する信号合成手段と、

該信号合成手段にて得られた合成信号から下り伝送情報を復元する情報復元手段と、

上記信号合成手段にて得られた合成信号の受信品質を演算する受信品質演算手段と、

該受信品質演算手段にて演算された受信品質に基づいて各基地局の送信電力を制御するための送信電力制御情報を生成する送信電力制御情報生成手段と、

該送信電力制御情報生成手段にて生成された送信電力制御情報を各基地局に送信する送信電力制御情報送信手段と、

請求項１乃至１７いずれか記載の送信電力制御装置とを有する移動局。

２５．他の通信装置と信号の無線送受信を行い、受信信号品質に基づいて決定した上記他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信する通信装置での送信電力を上記他の通信装置からの所定の情報に基づいて制御する送信電力制御方法において、

上記受信信号品質が所定の品質より低下したか否かを判定する品質判定手順と、

該品質判定手順により当該受信信号品質が所定の品質より低下したと判定されたときに、送信電力を、上記他の通信装置からの所定の情報にかかわらず、当該判定時の送信電力値から所定の特性に従って上昇させる自律制御手順とを有する送信電力制御方法。

２６．請求項２５記載の送信電力制御方法において、

上記通信装置は、受信信号品質値が目標受信品質値に近づくように決定した送信電力制御情報を他の通信装置に送信するものであって、

上記品質判定手順は、上記受信信号品質値が第一の閾値より低下したか否かを判定する第一の閾値判定手順を有し、

上記第一の閾値判定手順にて上記受信信号品質値が上記第一の閾値より低下していると判定されたときに、上記受信信号品質が所定の品質より低下したと判定する送信電力制御方法。

２７．請求項２５記載の送信電力制御方法において、

上記通信装置は、受信信号品質値が目標受信品質値に近づくように決定した送信電力制御情報を他の通信装置に送信するものであって、

上記品質判定手順は、上記目標受信品質値から上記受信品質値を減算して差分値を演算する差分値演算手順と、

上記差分値演算手順にて演算された当該差分値が第二の閾値以上となるか否かを判定する第二の閾値判定手順とを有し、

上記第二の閾値判定手順にて上記差分値が上記第二の閾値以上となると判定されたときに、上記受信信号品質が所定の品質より低下したと判定する送信電力制御方法。

２８．請求項２５記載の送信電力制御方法において、

上記通信装置は、受信信号品質値が所定のパラメータに従って制御される目標受信品質値に近づくよう決定した送信電力制御情報を他の通信装置に送信するものであって、

上記品質判定手順は、上記受信信号品質値が第一の閾値より低下したか否かを判定する第一の閾値判定手順と、

上記目標受信品質値から上記受信品質値を減算して差分値を演算する差分値演算手順と、

上記差分値演算手順にて演算された当該差分値が第二の閾値以上となるか否かを判定する第二の閾値判定手順と、

上記第一の閾値判定手順にて上記受信信号品質値が上記第一の閾値より低下していると判定されたとき、または、上記第二の閾値判定手順にて上記差分値が上記第二の閾値以上であると判定されたときに、上記受信信号品質が所定の品質より低下したと判定する送信電力制御方法。

２９．請求項２５乃至２８いずれか記載の送信電力制御方法において、

上記自律制御手順は、上記所定の特性に従って送信電力を上昇させる自律送信電力制御情報を生成する手順と、

上記品質判定手順により上記受信信号品質が所定の品質より低下したと判定されたときに、上記他の通信装置からの送信電力制御情報に基づいた送信電力制御から上記自律送信電力制御情報に基づいた送信電力制御に切換える制御切換え手順とを有する送信電力制御方法。

３０．請求項２５乃至２９いずれか記載の送信電力制御方法において、

上記自律制御手順は、上記所定の特性に従って送信電力を上昇させる過程で、その送信電力の上昇量が所定量に達したか否かを判定する判定手順と、

該判定手順にてその送信電力の上昇量が所定量に達したと判定されたときに、上記所定の特性に従って送信電力を上昇させることを停止させる自律制御停止手順とを有する送信電力制御方法。

３１．他の通信装置と信号の無線送受信を行い、受信信号品質に基づいて決定した上記他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信する通信装置での送信電力を上記他の通信装置からの所定の情報に基づいて制御する送信電力制御装置において、

上記受信信号品質が所定の品質より低下したか否かを判定する品質判定手段と、

該品質判定手段により当該受信信号品質が所定の品質より低下したと判定され

たときに、送信電力を、上記他の通信装置からの所定の情報にかかわらず、当該判定時の送信電力値から所定の特性に従って上昇させる自律制御手段とを有する送信電力制御装置。

３２．請求項３１記載の送信電力制御装置において、

上記通信装置は、受信信号品質値が目標受信品質値に近づくように決定した送信電力制御情報を他の通信装置に送信するものであって、

上記品質判定手段は、上記受信信号品質値が第一の閾値より低下したか否かを判定する第一の閾値判定手段を有し、

上記第一の閾値判定手段にて上記受信信号品質値が上記第一の閾値より低下していると判定されたときに、上記受信信号品質が所定の品質より低下したと判定するようにした送信電力制御装置。

３３．請求項３１記載の送信電力制御装において、

上記通信装置は、受信信号品質値が目標受信品質値に近づくように決定した送信電力制御情報を他の通信装置に送信するものであって、

上記品質判定手段は、上記目標受信品質値から上記受信品質値を減算して差分値を演算する差分値演算手段と、

上記差分値演算手段にて演算された当該差分値が第二の閾値以上となるか否かを判定する第二の閾値判定手段とを有し、

上記第二の閾値判定手段にて上記差分値が上記第二の閾値以上となると判定されたときに、上記受信信号品質が所定の品質より低下したと判定するようにした送信電力制御装置。

３４．請求項３１記載の送信電力制御装置において、

上記通信装置は、受信信号品質値が所定のパラメータに従って制御される目標受信品質値に近づくよう決定した送信電力制御情報を他の通信装置に送信するものであって、

上記品質判定手段は、上記受信信号品質値が第一の閾値より低下したか否かを

判定する第一の閾値判定手段と、

上記目標受信品質値から上記受信品質値を減算して差分値を演算する差分値演算手段と、

上記差分値演算手段にて演算された当該差分値が第二の閾値以上となるか否かを判定する第二の閾値判定手段と、

上記第一の閾値判定手段にて上記受信信号品質値が上記第一の閾値より低下していると判定されたとき、または、上記第二の閾値判定手段にて上記差分値が上記第二の閾値以上であると判定されたときに、上記受信信号品質が所定の品質より低下したと判定するようにした送信電力制御装置。

３５．請求項３１乃至３４いずれか記載の送信電力制御装置において、

上記自律制御手段は、上記所定の特性に従って送信電力を上昇させる自律送信電力制御情報を生成する手段と、

上記品質判定手段により上記受信信号品質が所定の品質より低下したと判定されたときに、上記他の通信装置からの送信電力制御情報に基づいた送信電力制御から上記自律送信電力情報情報に基づいた送信電力制御に切換える制御切換え手段とを有する送信電力制御装置。

３６．請求項３１乃至３５いずれか記載の送信電力制御装置において、

上記自律制御手段は、上記所定の特性に従って送信電力を上昇させる過程で、その送信電力の上昇量が所定量に達したか否かを判定する判定手段と、

該判定手段にてその送信電力の上昇量が所定量に達したと判定されたときに、上記所定の特性に従って送信電力を上昇させることを停止させる自律制御停止手段とを有する送信電力制御装置。

３７．他の通信装置と信号の無線送受信を行い、受信信号品質に基づいて決定した上記他の通信装置での送信電力制御に用いられるべき送信電力制御情報を送信する送信電力制御情報送信手段と、

上記他の通信装置からの所定の情報に基づいて送信電力を制御する制御手段と

、

請求項３１乃至３６いずれか記載の送信電力制御装置を有する通信装置。

３８．符号多元接続方式の移動通信システムに用いられる移動局となる請求項３７記載の通信装置。

３９．移動通信システムにおける基地局と移動局との間で情報データの伝送が開始される前において、基地局から移動局の送信電力制御に用いられるべき送信電力制御情報を送信すると共に基地局と移動局との間で信号を送受信して同期をとるための処理がなされる際に移動局での送信電力を制御する送信電力制御方法において、

基地局からの信号に対する移動局での同期が確立された後に、基地局からの送信電力制御情報に係わらず、送信電力を、初期値から所定の特性に従って上昇させるように制御する自律制御手順を有する送信電力制御方法。

４０．請求項４０記載の送信電力制御方法において、

上記自律制御手順は、上記基地局からの送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を上昇させるように制御する送信電力制御方法。

４１．請求項３９または４０記載の送信電力制御方法において、

上記自律制御手順による送信電力の制御が開始された後に、当該自律制御手順による送信電力の制御を停止させるべき所定の条件が満足されたか否かを判定する自律制御停止条件判定手順と、

該自律制御停止条件判定手順によって上記所定の条件が満足されたと判定されたときに、上記自律制御手順による送信電力の制御から上記基地局からの送信電力制御情報に基づいた送信電力の制御に切換える制御切換え手順とを有する送信電力制御方法。

４２．請求項４１記載の送信電力制御方法において、

上記自律制御停止条件判定手順は、上記自律制御手順による送信電力の制御が開始されてから所定時間が経過したか否かを判定し、上記自律制御手順による送信電力の制御が開始されてから上記所定時間が経過したとの判定を上記所定の条件が満足されたとの判定とする送信電力制御方法。

４３．請求項４１記載の送信電力制御方法において、

上記基地局は、当該基地局での同期が確立される前では、所定の送信電力制御情報を送信し、上記移動局からの信号に基づいて当該基地局での同期が確立された後では、移動局から送信される信号の受信品質に基づいて決められる閉ループ送信電力制御情報を送信するようにし、

上記自律制御停止条件判定手順は、上記基地局から受信される送信電力制御情報が、上記所定の送信電力制御情報から閉ループ送信電力制御情報に変わったか否かを判定する制御情報変更判定手順を有し、

該制御情報変更判定手順にてなされる上記基地局から受信される送信電力制御情報が上記所定の送信電力制御情報から閉ループ送信電力制御情報に変わったとの判定を上記所定の条件が満足されたとの判定とする送信電力制御方法。

４４．請求項４３記載の送信電力制御方法において、

上記自律制御停止条件判定手順は、上記自律制御手順による送信電力制御が開始されてから所定時間が経過したか否かを判定する開始タイミング判定手順を有し、

該開始タイミング判定手順にて上記自律制御手順による送信電力制御が開始されてから上記所定時間が経過したと判定されたときに、上記制御情報変更判定手順に従った判定を開始する送信電力制御方法。

４５．移動通信システムにおける基地局と移動局との間で情報データの伝送が開始される前において、基地局から移動局の送信電力制御に用いられるべき送信電力制御情報を送信すると共に基地局と移動局との間で信号を送受信して同期をと

るための処理がなされる際に移動局での送信電力を制御する送信電力制御方法において、

基地局からの信号に対する移動局での同期が確立された後に、該基地局からの送信電力制御情報に基づいて生成される当該送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を制御するための緩特性送信電力制御情報に基づいて送信電力を制御する緩特性送信電力制御手順を有する送信電力制御方法。

４６．請求項４５記載の送信電力制御方法において、

上記緩特性送信電力制御手順による送信電力制御が開始された後に、当該緩特性送信電力制御手順による送信電力の制御を停止させるべき所定の条件が満足されたか否かを判定する緩特性送信電力制御停止判定手順と、

該緩特性送信電力制御停止判定手順によって上記所定の条件が満足されたと判定されたときに、上記緩特性送信電力制御手順による送信電力の制御から上記基地局からの送信電力制御に基づいた送信電力の制御に切換える制御切換え手順とを有する送信電力制御方法。

４７．移動通信システムにおける基地局と移動局との間で情報データの伝送が開始される前において、基地局から移動局の送信電力制御に用いられるべき送信電力制御情報を送信すると共に基地局と移動局との間で信号を送受信して同期をとるための処理がなされる際に移動局での送信電力を制御する送信電力制御装置において、

基地局からの信号に対する移動局での同期が確立された後に、基地局からの送信電力制御情報に係わらず、送信電力を、初期値から所定の特性に従って上昇させるように制御する自律制御手段を有する送信電力制御装置。

４８．請求項４７記載の送信電力制御装置において、

上記自律制御手段は、上記基地局からの送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を上昇さ

せるように制御する送信電力制御装置。

４９．請求項４７または４８記載の送信電力制御装置において、

上記自律制御手段による送信電力の制御が開始された後に、当該自律制御手段による送信電力の制御を停止させるべき所定の条件が満足されたか否かを判定する自律制御停止条件判定手段と、

該自律制御停止条件判定手段によって上記所定の条件が満足されたと判定されたときに、上記自律制御手段による送信電力の制御から上記基地局からの送信電力制御情報に基づいた送信電力の制御に切換える制御切換え手段とを有する送信電力制御装置。

５０．請求項４９記載の送信電力制御装置において、

上記自律制御停止条件判定手段は、上記自律制御手段による送信電力の制御が開始されてから所定時間が経過したか否かを判定するようにし、上記自律制御手段による送信電力の制御が開始されてから上記所定時間が経過したとの判定を上記所定の条件が満足されたとの判定とした送信電力制御装置。

５１．請求項４９記載の送信電力制御装置において、

上記基地局は、当該基地局での同期が確立される前では、所定の送信電力制御情報を送信し、上記移動局からの信号に基づいて当該基地局での同期が確立された後では、移動局から送信される信号の受信品質に基づいて決められる閉ループ送信電力制御情報を送信するようにし、

上記自律制御停止条件判定手段は、上記基地局から受信される送信電力制御情報が、上記所定の送信電力制御情報から閉ループ送信電力制御情報に変わったか否かを判定する制御情報変更判定手段を有し、

該制御情報変更判定手段にてなされる上記基地局から受信される送信電力制御情報が上記所定の送信電力制御情報から閉ループ送信電力制御情報に変わったと判定を上記所定の条件が満足されたとの判定とした送信電力制御装置。

５２．請求項５１記載の送信電力制御装置において、

上記自律制御停止条件判定手段は、上記自律制御手段による送信電力制御が開始されたから所定時間が経過したか否かを判定する開始タイミング判定手段を有し、

該開始タイミング判定手段にて上記自律制御手段による送信電力制御が開始されてから上記所定時間が経過したと判定されたときに、上記制御情報変更判定手段による判定を開始するようにした送信電力制御装置。

５３．移動通信システムにおける基地局と移動局との間で情報データの伝送が開始される前において、基地局から移動局の送信電力制御に用いられるべき送信電力制御情報を送信すると共に基地局と移動局との間で信号を送受信して同期をとるための処理がなされる際に移動局での送信電力を制御する送信電力制御装置において、

基地局からの信号に対する移動局での同期が確立された後に、該基地局からの送信電力制御情報に基づいて生成される当該送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を制御するための緩特性送信電力制御情報に基づいて送信電力を制御する緩特性送信電力制御手段を有する送信電力制御装置。

５４．請求項５３記載の送信電力制御装置において、

上記緩特性送信電力制御手段による送信電力制御が開始された後に、当該緩特性送信電力制御手段による送信電力の制御を停止させるべき所定の条件が満足されたか否かを判定する緩特性送信電力制御停止判定手段と、

該緩特性送信電力制御停止判定手段によって上記所定の条件が満足されたと判定されたときに、上記緩特性送信電力制御手段による送信電力の制御から上記基地局からの送信電力制御に基づいた送信電力の制御に切換える制御切換え手段とを有する送信電力制御方法。

５５．送信電力制御に用いられるべき送信電力制御情報を送信する基地局に対し

て情報データの伝送を行う前において、基地局との間で信号を送信して同期をとるための処理がなされる際に送信電力を制御する送信電力制御装置を有する移動局において、

上記送信電力制御装置は、基地局からの信号に対する当該移動局での同期が確立された後に、基地局からの送信電力制御情報に係わらず、送信電力を、初期値から所定の特性に従って上昇させるように制御する自律制御手段を有する移動局。

５６．請求項５５記載の移動局において、

上記送信電力制御装置は、更に、上記自律制御手段による送信電力の制御が開始された後に、当該自律制御手段による送信電力の制御を停止させるべき所定の条件が満足されたか否かを判定する自律制御停止条件判定手段と、

該自律制御停止条件判定手段によって上記所定の条件が満足されたと判定されたときに、上記自律制御手段による送信電力の制御から上記基地局からの送信電力制御情報に基づいた送信電力の制御に切換える制御切換え手段とを有する移動局。

５７．送信電力制御に用いられるべき送信電力制御情報を送信する基地局に対して情報データの伝送信を行う前において、基地局との間で信号を送信して同期をとるための処理がなされる際に送信電力を制御する送信電力制御装置を有する移動局において、

上記送信電力制御装置は、基地局からの信号に対する移動局での同期が確立された後に、該基地局からの送信電力制御情報に基づいて生成される当該送信電力制御情報に基づいた送信電力制御による送信電力の変化より緩やかに変化する特性に従って送信電力を制御するための緩特性送信電力制御情報に基づいて送信電力を制御する緩特性送信電力制御手段を有する移動局。

５８．請求項５７記載の移動局において、

上記送信電力制御装置は、更に、上記緩特性送信電力制御手段による送信電力

制御が開始された後に、当該緩特性送信電力制御手段による送信電力の制御を停止させるべき所定の条件が満足されたか否かを判定する緩特性送信電力制御停止判定手段と、

該緩特性送信電力制御停止判定手段によって上記所定の条件が満足されたと判定されたときに、上記緩特性送信電力制御手段による送信電力の制御から上記基地局からの送信電力制御に基づいた送信電力の制御に切換える制御切換え手段とを有する移動局。

[X] Further documents are listed in the continuation of Box C. [ ] See patent family annex.

* Special categories of cited documents:
"A" document defining the general state of the art which is not considered to be of particular relevance
"E" earlier document but published on or after the international filing date
"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
"O" document referring to an oral disclosure, use, exhibition or other means
"P" document published prior to the international filing date but later than the priority date claimed
"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
"&" document member of the same patent family

Final rejection

P.1

February 29, 2012 Patent Application No. 2007-525302 drafting date of the patent application number
Closed loop / open-complex type of the title of the invention in a wireless communication system Masatoshi Ishida, 4446 5W00 Patent Office examiner
Power control
Wireless Technology Solutions, LLC applicant for a patent
(Two outside) Tadahiko Ito agent

For this application, by the three reasons stated in the notice of reasons for refusal dated 20 July FY2011, is to be refused.
Although we considered the contents of the amendments and procedures written opinion, Ru enough evidence to overturn the reasons for refusal can not be Miidase.

Remarks about the claims 1 to 24

Applicant, and the submission of a written amendment, written opinion dated October 25, Heisei 23
, Argues that as follows.

"The present invention is, as described in claim 1, after correction" resource allocation and uplink transmissions are scheduled Ru pail, was sent to the mobile terminal from the base station in the downlink channel of said downlink channel transmission power control (TPC
The one of the features that you will "and receive) command. Features include other similar claims.
Be sent or received TPC commands and downlink channel assignment and transmission resources in this way, in a citation has not been described or suggested.
According to the present invention, the TPC command to communicate with a relatively low signaling overhead will be possible.
Therefore, the present invention, but not identical, to the invention has been described in a citation, cited
Nor does it easily can be conceived from 1. "

However, the above can not claim to adopt the following reasons.

Page 18 line 27 of a citation P.2 - in Figure 3 and the first 25 lines of page 31,
A method of power control in a wireless communication system and a "(. Equivalent to" mobile terminal) MS base station and mobile station ",
In said mobile station (MS), "the path loss of radio channel" (propagation loss between the base station and said mobile station MS
Equivalent to. TPC signal to determine), was sent to said mobile station (MS) from the base station in the downlink channel

http://www6.ipdl.inpit.go.jp/JP/application/P/2007-525302/content.aipn?fn=/763/13.03.20 ...

2012/05/24

Transmission of MS and the mobile station based on the TPC signal and said received and propagation loss, the above issue has been determined (. Equivalent to "(TPC) transmission power control commands")
Transmit power levels to set the power level was set above, a power control method to send a signal
"Have been described.
In mobile communications, to send information about resource allocation in the downlink channel uplink transmission, uplink transmission is performed based on the information in question is well known in the art, for example, JP-A No. 2004-40187 open the art (especially The following are described in the paragraph.) called "a well-known literature" in the [0003].
Invention has been described in a literature known from belonging to the technical field of mobile communications, both in power control method that is described in Patent Document 1, up has been described in a literature well-known "in the downlink channel and a citation said base Tet allocation of resources for the uplink transmission "to apply the technology," to send information about the resource allocation link transmission, do the uplink transmission on the basis of such information is scheduled in the downlink channel, the downlink channel above Set the transmit power level of the mobile terminal based on the TPC and command and said pathloss received and (TPC) power control command is sent, has been determined above, is set above was sent to the mobile terminal from the station transmit power level, to try to "send a signal in the uplink transmission resources are scheduled above is that a person skilled in the art can easily conceived.

In addition to the above-mentioned study, in the setting of the transmit power level, remove and select to incorporate the parameters of the diffusion rate
Incorporating the parameters of the transport format is well known in the art, the art, for example 3GPP TR 25.804 V6.0.0 (2005-03) (hereinafter referred to as "two well-known literature"
. That are described in the formula of page 26). To set the transmit power level based on the accumulation of TPC command is also conventional means.

Accordingly, the invention according to 24, those skilled in the art is conceived easily obtained from well-known technology and cited one of claims 1 to the present.

The above, to adopt the applicant's claim can not be.

POWER OF ATTORNEY TO PROSECUTE APPLICATIONS BEFORE THE USPTO

I hereby revoke all previous powers of attorney given in the application identified in the attached statement under 37 CFR 3.73(b).

I hereby appoint:

[x] Practitioners associated with the Customer Number: **3624**

OR

[ ] Practitioner(s) named below (if more than ten patent practitioners are to be named, then a customer number must be used):

Name	Registration Number	Name	Registration Number

as attorney(s) or agent(s) to represent the undersigned before the United States Patent and Trademark Office (USPTO) in connection with any and all patent applications assigned only to the undersigned according to the USPTO assignment records or assignment documents attached to this form in accordance with 37 CFR 3.73(b).

Please change the correspondence address for the application identified in the attached statement under 37 CFR 3.73(b) to:

[x] The address associated with Customer Number: **3624**

OR

[ ] Firm or Individual Name					
Address					
City		State		Zip	
Country		Telephone		Email	

Assignee Name and Address:

Intellectual Ventures Holding 81 LLC
7251 W. Lake Mead Blvd.
Suite 300
Las Vegas, NV 89128

A copy of this form, together with a statement under 37 CFR 3.73(b) (Form PTO/SB/96 or equivalent) is required to be filed in each application in which this form is used. The statement under 37 CFR 3.73(b) may be completed by one of the practitioners appointed in this form if the appointed practitioner is authorized to act on behalf of the assignee, and must identify the application in which this Power of Attorney is to be filed.

SIGNATURE of Assignee of Record

The individual whose signature and title is supplied below is authorized to act on behalf of the assignee

Signature	Jeremy Sanders	Date	24 May 2012
Name	Jeremy Sanders	Telephone	/
Title	Authorized Person for Intellectual Ventures Holding 81 LLC		

DECLARATION REGARDING AUTHORITY TO SIGN ON BEHALF OF A LEGAL ENTITY
(37 C.F.R. 3.73(b)(2)(i))

I, Jeremy Sanders (whose title is supplied below), hereby declare that I am authorized to sign on behalf of Intellectual Ventures Holding 81 LLC.

Jeremy Sanders, Authorized Person for Intellectual Ventures Holding 81 LLC

24 May 2012
[date]

STATEMENT UNDER 37 CFR 3.73(b)

Applicant/Patent Owner: Intellectual Ventures Holding 81 LLC

Application No./Patent No.: 10/917,968 Filed/Issue Date: August 12, 2004

Titled: POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM

INTELLECTUAL VENTURES HOLDING 81 LLC, a LIMITED LIABILITY COMPANY
(Name of Assignee) (Type of Assignee, e.g., corporation, partnership, university, government agency, etc.

states that it is:

1. [X] the assignee of the entire right, title, and interest in;

2. [ ] an assignee of less than the entire right, title, and interest in
(The extent (by percentage) of its ownership interest is ________ %); or

3. [ ] the assignee of an undivided interest in the entirety of (a complete assignment from one of the joint inventors was made)

the patent application/patent identified above, by virtue of either:

A. [ ] An assignment from the inventor(s) of the patent application/patent identified above. The assignment was recorded in the United States Patent and Trademark Office at Reel ________, Frame ________, or for which a copy therefore is attached.

OR

B. [X] A chain of title from the inventor(s), of the patent application/patent identified above, to the current assignee as follows:

1. From: NICHOLAS WILLIAM ANDERSON To: IPWIRELESS, INC.
The document was recorded in the United States Patent and Trademark Office at
Reel 015474, Frame 0248, or for which a copy thereof is attached.

2. From: IPWIRELESS, INC. To: NORTHROP GRUMMAN INFORMATION TEC
The document was recorded in the United States Patent and Trademark Office at
Reel 022102, Frame 0891, or for which a copy thereof is attached.

3. From: NORTHROP GRUMMAN INFORMATION TEC To: IPWIRELESS, INC.
The document was recorded in the United States Patent and Trademark Office at
Reel 024006, Frame 0144, or for which a copy thereof is attached.

[X] Additional documents in the chain of title are listed on a supplemental sheet(s).

[X] As required by 37 CFR 3.73(b)(1)(i), the documentary evidence of the chain of title from the original owner to the assignee was, or concurrently is being, submitted for recordation pursuant to 37 CFR 3.11.

[NOTE: A separate copy (*i.e.*, a true copy of the original assignment document(s)) must be submitted to Assignment Division in accordance with 37 CFR Part 3, to record the assignment in the records of the USPTO. See MPEP 302.08]

The undersigned (whose title is supplied below) is authorized to act on behalf of the assignee.

Privacy Act Statement

The **Privacy Act of 1974** (**P.L. 93-579**) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

COMMUNICATION RE APPEAL BOARD DECISION

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Applicant respectfully requests notification of the status of the above-identified application. More than twenty-one months have passed since the Advisory Action was received and applicant has not received any substantive action. Applicant respectfully requests a timeline for an Appeal Board decision.

Respectfully submitted,

Nicholas W. Anderson

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

BEFORE THE PATENT TRIAL AND APPEAL BOARD

Ex parte NICHOLAS WILLIAM ANDERSON

Appeal 2011-010366
Application 10/917,968
Technology Center 2600

Before JOSEPH L. DIXON, HUNG H. BUI, and DANIEL N. FISHMAN, *Administrative Patent Judges*.

BUI, *Administrative Patent Judge*.

DECISION ON APPEAL

Appellant[1] seeks our review under 35 U.S.C. § 134(a) of the Examiner's final rejections of claims 1-4, 7, 8, 15-17, 26, 28, 30-34, and 43-50. We have jurisdiction under 35 U.S.C. § 6(b).

We AFFIRM.[2]

---

[1] The Real Party in Interest is Wireless Technology Solutions LLC.

STATEMENT OF THE CASE

Appellant's Invention

Appellant's invention relates to a method and system of controlling power levels in a wireless communication system. A method includes measuring a power level of a received signal, receiving a transmit power control (TPC) command, and calculating a transmit power level based on the power level of the received signal and the TPC command. Abstract.

Claims on Appeal

Claims 1, 26, 43, 46, 49, and 50 are the independent claims on appeal. Claim 1 is representative of the Appellant's invention, as reproduced with disputed limitations emphasized below:

> 1. A method of power control in a radio communication system, the method comprising, at a remote transceiver:
>
> determining a path loss for a radio channel between a base station and the remote transceiver; and
>
> on a *shared physical channel* used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command; and
>
> calculating at the remote transceiver, a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command.

---

[2] Our decision refers to Appellant's Appeal Brief filed December 17, 2010 ("App. Br."); Reply Brief filed May 31, 2011 ("Reply Br."); Examiner's Answer mailed March 29, 2011 ("Ans."); Final Office Action mailed January 8, 2010 ("Final Rej."); and the original Specification filed August 12, 2004 ("Spec.").

Evidence Considered

The prior art relied upon by the Examiner in rejecting the claims on appeal is:

Zeira	WO 00/57574	Sep. 28, 2000
Chen	US 2005/0025056 A1	Feb. 3, 2005
Van Lieshout	US 2001/0036823 A1	Nov. 1, 2001
Shiu	US 6,983,166 B2	Jan. 3, 2006
Krishnan	US 2005/0176455 A1	Aug. 11, 2005

Examiner's Rejections[3]

(1) Claims 1-4, 7, 15, 26, 28, 32, 33, 43, 46, 49, and 50 stand rejected under 35 U.S.C. §103(a) as being unpatentable over Zeira, Chen, and Van Lieshout. Ans. 3-18.

(2) Claims 8 and 34 stand rejected under 35 U.S.C. §103(a) as being unpatentable over Zeira, Chen, Van Lieshout, and Shiu. Ans. 18-19.

(3) Claims 16, 17, 30, 31, 44, 45, 47, and 48 stand rejected under 35 U.S.C. §103(a) as being unpatentable over Zeira, Chen, Van Lieshout, Shiu, and Krishna. Ans. 19-21.

ISSUE

Based on Appellant's arguments, the issue on appeal is whether the Examiner erred in rejecting claims 1-4, 7, 15, 26, 28, 32, 33, 43, 46, 49, and 50 under 35 U.S.C. §103(a) as being unpatentable over Zeira, Chen, and Van

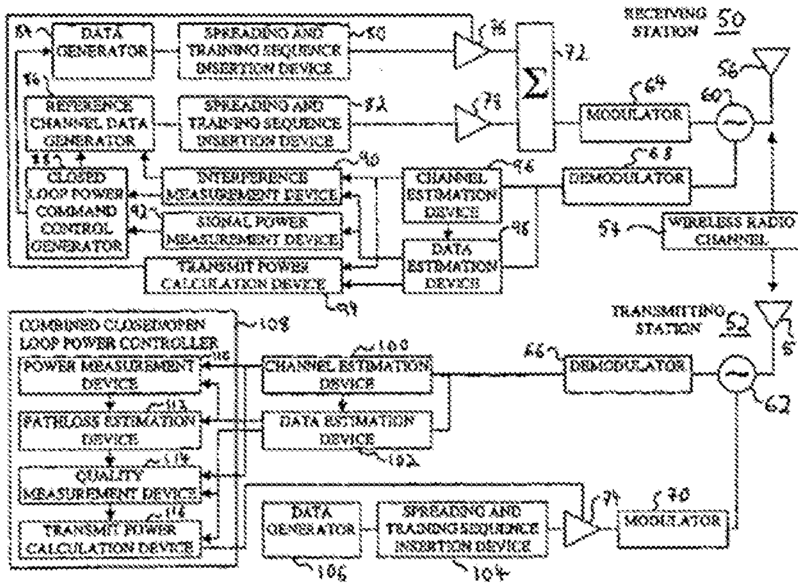
[3] Claims 26, 28, 30-34, and 46-48 were also rejected under 35 U.S.C. § 101 and under 35 U.S.C. § 112, first paragraph. *See* App. Br. 8. However, the rejections of these claims have been withdrawn as per Ans. 21.

Lieshout. In particular, the appeal turns on whether the Examiner's combination of Zeira, Chen, and Van Lieshout discloses or suggests the limitation "on a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver, receiving an allocation of a scheduled uplink transmission resource and transmit power control (TPC) command," as recited in independent claims 1 and 26, and similarly recited in independent claims 43, 46, 49, and 50. App. Br. 13-15.

ANALYSIS

The Examiner finds Zeira discloses a similar system power control in a radio communications and a similar method determining a path loss of a wireless radio channel between a base station and a remote transceiver, receiving a transmit power control (TPC) command, and calculating at the remote transceiver a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command. Ans. 4 and 21-22 (citing Zeira, p. 2, ll. 14-21; p. 4, ll. 17-18; p. 5, ll. 8; FIG. 4 and Abstract).

FIG. 4 of Zeira is reproduced below.



<u>FIG. 4 of Zeira shows a receiving station 50 as Appellant's claimed "base station" and a transmitting station 52 as Appellant's claimed "remote transceiver"</u>

The Examiner acknowledges that Zeira discloses a wireless radio channel 54, shown in FIG. 4, but does not explicitly disclose "a shared physical channel used to carry allocation and scheduling information from the base station to the remote transceiver". *Id.* at 4-5 and 22. The Examiner then finds Chen discloses using a dedicated control channel to carry allocation and scheduling information from the base station to the remote transceiver and receiving an allocation of a scheduled uplink transmission resource. *Id.* at 5 and 22 (citing Chen, ¶¶ [0012], [0052]-[0057]). The Examiner acknowledges that Chen does not specifically disclose "a shared physical channel". However, the Examiner finds Van Lieshout discloses explicitly a shared physical channel used to carry information. *Id.* at 6 and 23 (citing Van Lieshout, ¶ [0006]).

Based on these disclosures and their same field of endeavor, the Examiner concludes that:

> [i]t would have been obvious … to combine the methods of determining a path loss of a radio channel between a base station and the remote transceiver, receiving a transmit power control (TPC) command, and calculating at the remote transceiver a transmit power level for transmission by the remote transceiver on the scheduled uplink transmission resource based upon the path loss and the TPC command of Zeira with the receiving an allocation of a scheduled uplink transmission resource on a dedicated control channel to carry allocation and scheduling information from the base station to the remote transceiver method step of Chen in order to perform the efficient scheduling processing and to allocate radio resources efficiently in the uplink high-speed packet communications (**Chen, par.12)…** to combine … with the shared physical channel used to carry information of Van Lieshout so that the mobile unit can find out the available resources that it can use from the base station.

Id. at 6.

Appellant disputes the Examiner's findings regarding Van Lieshout, and raises several arguments based on a premise that Van Lieshout does not disclose the missing feature "a shared physical channel" used to convey allocation and scheduling information. App. Br. 14. In particular, Appellant argues that Van Lieshout discloses a shared radio channel (i.e., shared physical channel, shown in FIG. 3 of Van Lieshout) to transport data between a remote device and a base station, but that shared radio channel does not convey allocation and scheduling information. *Id.* at 14-15. According to Appellant, Van Lieshout uses a non-shared downlink channel instead to convey downlink (not uplink) resources and, as a result, fails to teach sending uplink allocation and scheduling information on a shared physical channel as recited in Appellant's independent claims 1, 26, 43, 49, and 50. *Id.*

We do not find Appellant's arguments persuasive. Contrary to Appellant's contentions, we find Van Lieshout discloses the missing feature of Zeira and Chen, as correctly found by the Examiner. Ans. 6 and 21-23. The combination of Zeira and Chen discloses all the features specified by the claims except for a "shared" physical channel. Van Lieshout discloses this missing feature, i.e., a shared radio channel used to transmit data between a remote device and a base station. Ans. 23 (citing Van Lieshout, Abstract and FIGS. 3-4). Van Lieshout alone may not suggest conveying allocation and scheduling data over a shared radio channel, but with the combination of Chen and Van Lieshout discloses conveying allocation and scheduling data over a shared radio channel.

When a claimed invention "'simply arranges old elements with each performing the same function it had been known to perform' and yields no more than one would expect from such an arrangement, the combination is obvious." *KSR International Co. v. Teleflex, Inc.*, 550 U.S. 398, 417 (2007) (quoting *Sakraida v. Ag Pro, Inc.*, 425 U.S. 273, 282 (1976)). We find that the mere combining of Zeira, Chen, and Van Lieshout would have been obvious to one skilled in the art.

For the reasons set forth above, Appellant's contentions have not persuaded us of any error in the Examiner's position. Accordingly, we sustain the Examiner's obviousness rejection of independent claims 1, 26, 43, 46, 49, and 50 based on Zeira, Chen, and Van Lieshout.

Appellant presents no separate patentability arguments with respect to dependent claims 2-4, 7, 8, 15-17, 28, 30-34, 44-45, and 47-48. For the same reasons discussed, we also sustain the Examiner's obviousness rejection of claims 2-4, 7, 8, 15-17, 28, 30-34, 44-45, and 47-48.

CONCLUSION

On the record before us and arguments presented by Appellant, we conclude that the Examiner has not erred in rejecting claims 1-4, 7, 8, 15-17, 26, 28, 30-34, and 43-50 under 35 U.S.C. § 103(a).

DECISION

As such, we AFFIRM the Examiner's final rejection of claims 1-4, 7, 8, 15-17, 26, 28, 30-34, and 43-50.

No time period for taking any subsequent action in connection with this appeal may be extended under 37 C.F.R. § 1.136(a) (1) (iv).

AFFIRMED

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address--

This application is abandoned in view of:

1. ☒ Applicant's failure to timely file a proper reply to the Office letter mailed on _03 March 2014_.
   (a) ☐ A reply was received on _____ (with a Certificate of Mailing or Transmission dated _____), which is after the expiration of the period for reply (including a total extension of time of _____ month(s)) which expired on _____.
   (b) ☐ A proposed reply was received on _____, but it does not constitute a proper reply under 37 CFR 1.113 to the final rejection.
   (A proper reply under 37 CFR 1.113 to a final rejection consists only of: (1) a timely filed amendment which places the application in condition for allowance; (2) a timely filed Notice of Appeal (with appeal fee); or (3) a timely filed Request for Continued Examination (RCE) in compliance with 37 CFR 1.114).
   (c) ☐ A reply was received on _____ but it does not constitute a proper reply, or a bona fide attempt at a proper reply, to the non-final rejection. See 37 CFR 1.85(a) and 1.111. (See explanation in box 7 below).
   (d) ☒ No reply has been received.

2. ☐ Applicant's failure to timely pay the required issue fee and publication fee, if applicable, within the statutory period of three months from the mailing date of the Notice of Allowance (PTOL-85).
   (a) ☐ The issue fee and publication fee, if applicable, was received on _____ (with a Certificate of Mailing or Transmission dated _____), which is after the expiration of the statutory period for payment of the issue fee (and publication fee) set in the Notice of Allowance (PTOL-85).
   (b) ☐ The submitted fee of $_____ is insufficient. A balance of $_____ is due.
   The issue fee required by 37 CFR 1.18 is $_____. The publication fee, if required by 37 CFR 1.18(d), is $_____.
   (c) ☐ The issue fee and publication fee, if applicable, has not been received.

3. ☐ Applicant's failure to timely file corrected drawings as required by, and within the three-month period set in, the Notice of Allowability (PTO-37).
   (a) ☐ Proposed corrected drawings were received on _____ (with a Certificate of Mailing or Transmission dated _____), which is after the expiration of the period for reply.
   (b) ☐ No corrected drawings have been received.

4. ☐ The letter of express abandonment which is signed by the attorney or agent of record or other party authorized under 37 CFR 1.33(b). See 37 CFR 1.138(b).

5. ☐ The letter of express abandonment which is signed by an attorney or agent (acting in a representative capacity under 37 CFR 1.34) upon the filing of a continuing application.

6. ☐ The decision by the Board of Patent Appeals and Interference rendered on _____ and because the period for seeking court review of the decision has expired and there are no allowed claims.

7. ☒ The reason(s) below:

   An Appeal Brief for this case was filed on 12/17/2010 and the Examiner answer to Appeal Brief was mailed on 03/29/2011. Patent Board Decision--"Examier Affirmed" was made on 03/03/2014. There is no reply filed within a month after Patent Board Decision. Therefore, the Application is abandoned.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.

2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.

3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.

4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).

5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.

6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).

7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.

8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.

9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

REPLY PURSUANT TO 37 C.F.R. §1.114

Mail Stop RCE
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

This Reply is being timely filed in response to the Board Decision dated March 3, 2014. A Request for Continued Examination (RCE) is filed concurrently herewith.

Please amend the application without prejudice or disclaimer as follows:

Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

1-50. (CANCELED)

51. (NEW) A method performed by user equipment (UE), the method comprising:

receiving, by the UE, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

determining, by the UE, a path loss of a downlink channel;

receiving, on a single physical channel by the UE if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein the TPC command is accumulated with other received TPC commands;

calculating, by the UE if accumulation is enabled, a transmit power for an uplink communication based on both the path loss and the accumulated TPC commands; and

receiving, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data at a power level calculated by the UE based on the path loss.

52. (NEW) The method of claim 51, wherein the TPC command is a multilevel TPC command.

53. (NEW) The method of claim 51, wherein the UE is a code division multiple access (CDMA) UE.

54. (NEW) The method of claim 51, wherein the UE is a time division duplex (TDD) UE.

55. (NEW) The method of claim 51, wherein the determining the path loss further includes computing a difference between a signaled transmit power and a measured received power of the downlink channel.

56. (NEW) The method of claim 51, wherein the calculated transmit power is based on a selected transport format.

57. (NEW) The method of claim 51, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

58. (NEW) A user equipment (UE) comprising:

circuitry configured to receive, by the UE, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

circuitry to determine a path loss of a downlink channel;

the circuitry is further configured to receive, on a single physical channel if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein the TPC command is accumulated with other received TPC commands;

circuitry configured to calculate, by the UE if accumulation is enabled, a transmit power for an uplink communication based on both the path loss and the accumulated TPC commands; and

the circuitry is further configured to receive, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data at a power level calculated by the UE based on the path loss.

59. (NEW) The UE of claim 58, wherein the TPC command is a multilevel TPC command.

60. (NEW) The UE of claim 58, wherein the UE is a code division multiple access (CDMA) UE.

61. (NEW) The UE of claim 58, wherein the UE is a time division duplex (TDD) UE.

62. (NEW) The UE of claim 58, wherein the determination of the path loss further includes a computation of a difference between a signaled transmit power and a measured received power of the downlink channel.

63. (NEW) The UE of claim 58, wherein the calculated transmit power is based on a selected transport format.

64. (NEW) The UE of claim 58, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

65. (NEW) A method performed by a wireless network, the method comprising:

sending, by the wireless network, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

determining, by a user equipment (UE), a path loss of a downlink channel;

receiving, on a single physical channel by the UE if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein the TPC command is accumulated with other received TPC commands;

calculating, by the UE if accumulation is enabled, a transmit power for an uplink communication based on both the path loss and the accumulated TPC commands; and

receiving, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data to the wireless network at a power level calculated by the UE based on the path loss.

66. (NEW) The method of claim 65, wherein the TPC command is a multilevel TPC command.

67. (NEW) The method of claim 65, wherein the UE is a code division multiple access (CDMA) UE.

68. (NEW) The method of claim 65, wherein the UE is a time division duplex (TDD) UE.

69. (NEW) The method of claim 65, wherein the determining the path loss further includes computing a difference between a signaled transmit power and a measured received power of the downlink channel.

70. (NEW) The method of claim 65, wherein the calculated transmit power is based on a selected transport format.

71. (NEW) The method of claim 65, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

72. (NEW) A wireless network comprising:

the wireless network configured to send an indication of whether accumulation of transmit power control (TPC) commands is enabled;

a user equipment (UE) comprising:

circuitry configured to determine, by the UE, a path loss of a downlink channel;

circuitry configured to receive, on a single physical channel if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein the TPC command is accumulated with other received TPC commands;

circuitry configured to calculate, by the UE if accumulation is enabled, a transmit power for an uplink communication based on both the path loss and the accumulated TPC commands; and the circuitry is further configured to receive, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data to the wireless network at a power level calculated by the UE based on the path loss.

73. (NEW) The wireless network of claim 72, wherein the TPC command is a multilevel TPC command.

74. (NEW) The wireless network of claim 72, wherein the UE is a code division multiple access (CDMA) UE.

75. (NEW) The wireless network of claim 72, wherein the UE is a time division duplex (TDD) UE.

76. (NEW) The wireless network of claim 72, wherein the determination of the path loss further includes a computation of a difference between a signaled transmit power and a measured received power of the downlink channel.

77. (NEW) The wireless network of claim 72, wherein the calculated transmit power is based on a selected transport format.

78. (NEW) The wireless network of claim 72, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

79. (NEW) A method performed by a network device, the method comprising:

sending, by the network device, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

sending, on a single physical channel by the network device if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command to be accumulated with other received TPC commands at a user equipment (UE);

receiving, by the network device if accumulation is enabled, uplink communication at a transmit power, wherein the transmit power is calculated at the UE based on both a determined path loss of a downlink channel and the accumulated TPC commands; and

sending, on the single physical channel to the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data to the network device at a power level calculated at the UE based on the path loss.

80. (NEW) The method of claim 79, wherein the TPC command is a multilevel TPC command.

81. (NEW) The method of claim 79, wherein the network device is a code division multiple access (CDMA) network device.

82. (NEW) The method of claim 79, wherein the network device is a time division duplex (TDD) network device.

83. (NEW) The method of claim 79, wherein the determined path loss further includes computing a difference between a signaled transmit power and a measured received power of the downlink channel.

84. (NEW) The method of claim 79, wherein the calculated transmit power is based on a selected transport format.

85. (NEW) The method of claim 79, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

86. (NEW) A network device comprising:

circuitry configured to send, by the network device, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

the circuitry is further configured to send, on a single physical channel if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command to be accumulated with other received TPC commands at a user equipment (UE);

circuitry configured to receive, if accumulation is enabled, uplink communication at a transmit power, wherein the transmit power is calculated at the UE based on both a determined path loss of a downlink channel and the accumulated TPC commands; and

the circuitry is further configured to send, on the single physical channel if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data to the network device at a power level calculated at the UE based on the path loss.

87. (NEW) The network device of claim 86, wherein the TPC command is a multilevel TPC command.

88. (NEW) The network device of claim 86, wherein the network device is a code division multiple access (CDMA) network device.

89. (NEW) The network device of claim 86, wherein the network device is a time division duplex (TDD) network device.

90. (NEW) The network device of claim 86, wherein the determined path loss further includes a computation of a difference between a signaled transmit power and a measured received power of the downlink channel.

91. (NEW) The network device of claim 86, wherein the calculated transmit power is based on a selected transport format.

92. (NEW) The network device of claim 86, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

Amendments to the Specification:

Please replace paragraph [0025] of the originally filed application with the following amended paragraph:

[0025] FIGURE 1 shows a block diagram of a wireless communication system. A network 100 may include one or more base station controllers [[120]] 110, such as a radio network controller (RNC), and one or more base stations [[110,]] 120, 130 such as a Node-B, wherein each Node-B is connected to an RNC. The network 100 communicates with one or more users 140, 150 through a channel 160, also referred to as a radio link, created between a base station and a user.

Please substitute the Abstract with the following new Abstract:

ABSTRACT

Power control in a wireless network is disclosed. Transmit power control (TPC) commands may be accumulated by a user equipment (UE). If accumulation is enabled, the UE may receive on a single physical channel an allocation of a scheduled uplink resource and a TPC command. The TPC command may be accumulated with other received TPC commands. A transmit power for an uplink communication based on both the path loss and the accumulated TPC commands may then be calculated by the UE. If accumulation is not enabled, the UE may receive an allocation of a scheduled uplink resource to transmit data at a calculated power level.

REMARKS/ARGUMENTS

After the foregoing Amendment, claims 51-92 are currently pending in this application. Claims 1-50 are canceled. New claims 51-92 are added. In the specification, paragraph [0025] is amended. No new matter is added by any of these amendments.

New Claims Added in Response to Board Decision

A Board Decision on March 3, 2014 affirmed rejections of some of claims 1-50. Applicant respectfully disagrees with the Board's decision. However, rejected claims 1-50 are canceled and new claims 51-92 added in response to the decision. New claims 51-92 are allowable over the art used in the rejection of canceled claims 1-50. However, new claims 51-92 are within the same scope of search of canceled claims 1-50.

Conclusion

It should also be noted that although arguments have been presented with respect to certain claims herein, the recited subject matter as well as various other subject matter and/or combinations of subject matter may be patentable for other reasons. Further, the failure to address any statement by the Examiner herein should not be interpreted as acquiescence or agreement with such statement. The Applicants expressly reserve the right to set forth additional and/or alternative reasons for patentability and/or allowance with the present Application or in any other future proceeding, and to rebut any statement presented by the Examiner in this or other papers during prosecution of the present Application.

If the Examiner believes that any additional minor formal matters need to be addressed in order to place this application in condition for allowance, or that a telephonic interview will help to materially advance the prosecution of this application, the Examiner is invited to contact the undersigned by telephone at the Examiner's convenience.

In view of the foregoing, Applicant respectfully submits that the present application is in condition for allowance and a notice to that effect is respectfully requested.

Respectfully submitted,

Nicholas William Anderson

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTHS FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on *08/12/2014*.

☐ A declaration(s)/affidavit(s) under **37 CFR 1.130(b)** was/were filed on _____.

2a)☐ This action is **FINAL**. 2b)☒ This action is non-final.

3)☐ An election was made by the applicant in response to a restriction requirement set forth during the interview on _____; the restriction requirement and election have been incorporated into this action.

4)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims*

DETAILED ACTION

Claim Rejections - 35 USC § 112

2. The following is a quotation of the first paragraph of 35 U.S.C. 112(a):

> (a) IN GENERAL.—The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same, and shall set forth the best mode contemplated by the inventor or joint inventor of carrying out the invention.

The following is a quotation of the first paragraph of pre-AIA 35 U.S.C. 112:

> The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same, and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claims 51, 58, 65, 72, 79, and 86 are rejected under 35 U.S.C. 112(a) or 35 U.S.C. 112 (pre-AIA), first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor or a joint inventor, or for pre-AIA the inventor(s), at the time the application was filed, had possession of the claimed invention. In above claims, Applicant recites the limitations " receiving, by the UE, an indication of whether accumulation of transmit power control (TPC) commands is enabled, determining, by the UE, a path loss of a downlink channel, <u>receiving, on a single physical channel by the UE if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein</u>

the TPC command is accumulated with other received TPC commands, calculating, by the UE if accumulation is enabled, a transmit power for an uplink communication based on both the path loss and the accumulated TPC commands, and receiving, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data at a power level calculated by the UE based on the path loss”. The Examiner states that above underlying parts are not found in the specification.

Double Patenting

4. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory double patenting rejection is appropriate where the claims at issue are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the reference application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement. A terminal disclaimer must be signed in compliance with 37 CFR 1.321(b).

The USPTO internet Web site contains terminal disclaimer forms which may be used. Please visit http://www.uspto.gov/forms/. The filing date of the application will determine what form should be used. A web-based eTerminal Disclaimer may be filled out completely online using web-screens. An eTerminal Disclaimer that meets all requirements is auto-processed and approved immediately upon submission. For more information about eTerminal Disclaimers, refer to http://www.uspto.gov/patents/process/file/efs/guidance/eTD-info-I.jsp.

5. Claims 51-92 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-18 of co-pending application #13/726976 and 1-10 of co-pending application 13/727153. Although the conflicting claims are not identical, they are not patentably distinct from each other.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DOMINIC E. REGO whose telephone number is

(571)272-8132. The examiner can normally be reached on Monday-Friday, 9:00 am-5:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nay A. Maung can be reached on 571-272-7882. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

CERTIFICATION STATEMENT

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

☐ That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

OR

☐ That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

☐ See attached certification statement.

☒ The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

☐ A certification statement is not submitted herewith.

SIGNATURE

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these record s.

2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.

3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.

4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).

5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.

6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).

7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.

8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.

9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

INFORMATION DISCLOSURE STATEMENT

Mail Stop Amendment (via EFS)
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Further to Applicant's Duty of Disclosure pursuant to 37 C.F.R. §1.56, Applicant wishes to bring to the Examiner's attention the material cited on the enclosed SB-08 Form.

Copies of the newly cited documents are enclosed. Pursuant to 37 C.F.R. §1.98(a)(2)(ii), copies of the newly cited U.S. publications and/or patent documents have not been included.

Applicant would like to bring the following Applications to the Examiner's attention: U.S. Patent Application No. 13/727,153, filed December 26, 2012 and U.S. Patent Application No. 13/726,976, filed December 26, 2012.

It is respectfully requested that the Examiner consider these documents and return an initialed copy of the SB-08 Form indicating consideration of the cited materials.

Respectfully submitted,

Nicholas William Anderson

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

RESPONSE PURSUANT TO 37 C.F.R. §1.111

Mail Stop Amendment
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

This Response and Terminal Disclaimer are being timely filed in response to the Non-Final Office Action dated June 18, 2014.

Please amend the application without prejudice or disclaimer as follows:

3174020-1

<u>Amendments to the Claims</u>:

This listing of the claims will replace all prior versions of the claims in the application:

1-50. (CANCELED)

51. (Currently Amended) A method performed by user equipment (UE), the method comprising:

receiving, by the UE, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

determining, by the UE, a path loss of a downlink channel;

receiving, on a single physical channel by the UE if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein the TPC command is accumulated with other received TPC commands;

calculating, by the UE if accumulation is enabled, [[a]] transmit power ~~for~~ <u>in association with</u> an uplink communication based on both the path loss and the accumulated TPC commands; and

receiving, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data at a power level calculated by the UE based on the path loss.

52. (Previously Presented) The method of claim 51, wherein the TPC command is a multilevel TPC command.

53. (Previously Presented) The method of claim 51, wherein the UE is a code division multiple access (CDMA) UE.

54. (Previously Presented) The method of claim 51, wherein the UE is a time division duplex (TDD) UE.

55. (Previously Presented) The method of claim 51, wherein the determining the path loss further includes computing a difference between a signaled transmit power and a measured received power of the downlink channel.

56. (Previously Presented) The method of claim 51, wherein the calculated transmit power is based on a selected transport format.

57. (Previously Presented) The method of claim 51, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

58. (Currently Amended) A user equipment (UE) characterized in that ~~comprising~~:

circuitry is configured to receive, by the UE, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

circuitry is configured to determine a path loss of a downlink channel;

the circuitry is further configured to receive, on a single physical channel if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein the TPC command is accumulated with other received TPC commands;

circuitry is configured to calculate, by the UE if accumulation is enabled, [[a]] transmit power ~~for~~ in association with an uplink communication based on both the path loss and the accumulated TPC commands; and

the circuitry is further configured to receive, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data at a power level calculated by the UE based on the path loss.

59. (Previously Presented) The UE of claim 58, wherein the TPC command is a multilevel TPC command.

60. (Previously Presented) The UE of claim 58, wherein the UE is a code division multiple access (CDMA) UE.

61. (Previously Presented) The UE of claim 58, wherein the UE is a time division duplex (TDD) UE.

62. (Previously Presented) The UE of claim 58, wherein the determination of the path loss further includes a computation of a difference between a signaled transmit power and a measured received power of the downlink channel.

63. (Previously Presented) The UE of claim 58, wherein the calculated transmit power is based on a selected transport format.

64. (Previously Presented) The UE of claim 58, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

65. (Currently Amended) A method performed by a wireless network, the method comprising:

sending, by the wireless network, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

determining, by a user equipment (UE), a path loss of a downlink channel;

receiving, on a single physical channel by the UE if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein the TPC command is accumulated with other received TPC commands;

calculating, by the UE if accumulation is enabled, [[a]] transmit power ~~for~~ <u>in association with</u> an uplink communication based on both the path loss and the accumulated TPC commands; and

receiving, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data to the wireless network at a power level calculated by the UE based on the path loss.

66. (Previously Presented) The method of claim 65, wherein the TPC command is a multilevel TPC command.

67. (Previously Presented) The method of claim 65, wherein the UE is a code division multiple access (CDMA) UE.

68. (Previously Presented) The method of claim 65, wherein the UE is a time division duplex (TDD) UE.

69. (Previously Presented) The method of claim 65, wherein the determining the path loss further includes computing a difference between a signaled transmit power and a measured received power of the downlink channel.

70. (Previously Presented) The method of claim 65, wherein the calculated transmit power is based on a selected transport format.

71. (Previously Presented) The method of claim 65, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

72. (Currently Amended) A wireless network characterized in that ~~comprising~~:

the wireless network is configured to send an indication of whether accumulation of transmit power control (TPC) commands is enabled;

a user equipment (UE) characterized in that ~~comprising~~:

circuitry is configured to determine, by the UE, a path loss of a downlink channel;

circuitry is configured to receive, on a single physical channel if accumulation is enabled, an allocation of a scheduled uplink resource and a

TPC command, wherein the TPC command is accumulated with other received TPC commands;

circuitry is configured to calculate, by the UE if accumulation is enabled, [[a]] transmit power ~~for~~ in association with an uplink communication based on both the path loss and the accumulated TPC commands; and

the circuitry is further configured to receive, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data to the wireless network at a power level calculated by the UE based on the path loss.

73. (Previously Presented) The wireless network of claim 72, wherein the TPC command is a multilevel TPC command.

74. (Previously Presented) The wireless network of claim 72, wherein the UE is a code division multiple access (CDMA) UE.

75. (Previously Presented) The wireless network of claim 72, wherein the UE is a time division duplex (TDD) UE.

76. (Previously Presented) The wireless network of claim 72, wherein the determination of the path loss further includes a computation of a difference between a signaled transmit power and a measured received power of the downlink channel.

77. (Previously Presented) The wireless network of claim 72, wherein the calculated transmit power is based on a selected transport format.

78. (Previously Presented) The wireless network of claim 72, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

79. (Previously Presented) A method performed by a network device, the method comprising:

sending, by the network device, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

sending, on a single physical channel by the network device if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command to be accumulated with other received TPC commands at a user equipment (UE);

receiving, by the network device if accumulation is enabled, uplink communication at a transmit power, wherein the transmit power is calculated at the UE based on both a determined path loss of a downlink channel and the accumulated TPC commands; and

sending, on the single physical channel to the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data to the network device at a power level calculated at the UE based on the path loss.

80. (Previously Presented) The method of claim 79, wherein the TPC command is a multilevel TPC command.

81. (Previously Presented) The method of claim 79, wherein the network device is a code division multiple access (CDMA) network device.

82. (Previously Presented) The method of claim 79, wherein the network device is a time division duplex (TDD) network device.

83. (Previously Presented) The method of claim 79, wherein the determined path loss further includes computing a difference between a signaled transmit power and a measured received power of the downlink channel.

84. (Previously Presented) The method of claim 79, wherein the calculated transmit power is based on a selected transport format.

85. (Previously Presented) The method of claim 79, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

86. (Currently Amended) A network device characterized in that ~~comprising~~:

circuitry is configured to send, by the network device, an indication of whether accumulation of transmit power control (TPC) commands is enabled;

the circuitry is further configured to send, on a single physical channel if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command to be accumulated with other received TPC commands at a user equipment (UE);

circuitry is configured to receive, if accumulation is enabled, uplink communication at a transmit power, wherein the transmit power is calculated at the UE based on both a determined path loss of a downlink channel and the accumulated TPC commands; and

the circuitry is further configured to send, on the single physical channel if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data to the network device at a power level calculated at the UE based on the path loss.

87. (Previously Presented) The network device of claim 86, wherein the TPC command is a multilevel TPC command.

88. (Previously Presented) The network device of claim 86, wherein the network device is a code division multiple access (CDMA) network device.

89. (Previously Presented) The network device of claim 86, wherein the network device is a time division duplex (TDD) network device.

90. (Previously Presented) The network device of claim 86, wherein the determined path loss further includes a computation of a difference between a signaled transmit power and a measured received power of the downlink channel.

91. (Previously Presented) The network device of claim 86, wherein the calculated transmit power is based on a selected transport format.

92. (Previously Presented) The network device of claim 86, wherein the downlink channel or the single physical channel is each associated with a spreading factor or a code division multiple access (CDMA) code.

REMARKS/ARGUMENTS

After the foregoing Amendment, claims 51-92 are currently pending in this application. Claims 1-50 are canceled. Claims 51, 58, 65, 72, and 86 are amended.

Request for a Discussion

If any of the claims submitted herewith will be rejected by the Examiner, the Applicant respectfully requests the Examiner to contact the undersigned.

Double Patenting Rejection

Claims 51-92 are rejected under non-statutory double patenting as being unpatentable over claims 1-18 of U.S. Patent Application No. 13/726,976 and claims 1-10 of U.S. Patent Application No. 13/727,153. A Terminal Disclaimer is submitted herewith to overcome the rejection. Accordingly, withdrawal of the non-statutory double patenting rejection is respectfully requested.

Claim Rejections - 35 U.S.C. § 112

Claims 51, 58, 65, 72, 79, and 86 are rejected under 35 U.S.C. § 112(a) or 35 U.S.C. § 112 (pre-AIA), first paragraph, as failing to comply with the written description requirement. Applicant respectfully disagrees with the rejection. With respect to claim 51, support may **at least be found** in U.S. Pat. Publication No. 2006/0035660 (pre-grant publication of the present application):

- figure 3, in particular items 314, 316, 318, 320, 322, 300, 302, or 304;

- paragraph [0087] "...a Node-B or RNC may be implemented with a new parameter, either included in a signaling command or a broadcast message, where the new parameter instructs a UE to enable or disable the setting of uplink transmit power level based on both the path loss estimation and the TPC commands. A parameter may indicate whether a UE is to use open loop power control, closed loop power control or a combined scheme;"

- paragraph [0014] "...determining a path loss of a radio channel between a base station and a remote transceiver; receiving a transmit power control (TPC) command transmitted to the remote transceiver from the base station;"

- paragraph [0015] "...power control in a radio communications system, the method comprising: receiving a signal at a second transceiver transmitted from a first transceiver; measuring a power level of the received signal; receiving a transmit power control (TPC) command at the second transceiver transmitted from the first transceiver;"

- paragraph [0086] "[i]n a system using the combined power control scheme, a new physical channel on the downlink may be used to carry fast allocation and scheduling information to a user, thereby informing the UE of the uplink resources that it may use. This new physical channel could also be used as the feedback channel for the combined power control scheme. For example, an allocation/scheduling channel could carry TPC commands;"

- paragraph [0061] "[t]hus, for the current frame k, the UE may calculate the transmit power $P_{Tx}(k)$ as shown below where K is the initial frame number determined when the power control process begins; TPCi is -1 for a down TPC command, +1 for an up TPC command and 0 if no TPC command is received; and step is the magnitude of the amount added to an accumulator upon receipt of each TPC command. The transmit power $P_{Tx}(k)$ may be updated for every frame period. Alternatively, the transmit power $P_{Tx}(k)$ may be updated each time a new TPC command is received. Alternatively, the transmit power $P_{Tx}(k)$ may be updated only when either a TPC command or a new power level is received from the network.

$$P_{Tx}(k) = P_{open(k)} + \text{step} \cdot \sum_{i=k-K}^{k} TPC_i + y_{SF} + \beta_{TFC}$$

;" and

- paragraph [0057] "an open loop component may be located in the UE and driven by measured beacon received power levels and path loss calculations;"

The support above is roughly given in the order of claim elements expressed in claim 51. Current claims 58, 65, 72, 79, and 86 are also supported at least by the above paragraphs and figure 3. Based on the arguments presented above, withdrawal of the 35 U.S.C. § 112 rejection of claims 51, 58, 65, 72, 79, and 86 is respectfully requested.

Conclusion

It should also be noted that although arguments have been presented with respect to certain claims herein, the recited subject matter as well as various other subject matter and/or combinations of subject matter may be patentable for other reasons. Further, the failure to address any statement by the Examiner herein should not be interpreted as acquiescence or agreement with such statement. The Applicant expressly reserves the right to set forth additional and/or alternative reasons for patentability and/or allowance with the present application or in any other future proceeding, and to rebut any statement presented by the Examiner in this or other papers during prosecution of the present application.

If the Examiner believes that any additional minor formal matters need to be addressed in order to place this application in condition for allowance, or that a telephonic interview will help to materially advance the prosecution of this application, the Examiner is invited to contact the undersigned by telephone at the Examiner's convenience.

In view of the foregoing, Applicant respectfully submits that the present application, including claims 51-92, is in condition for allowance and a notice to that effect is respectfully requested.

Respectfully submitted,

Nicholas William Anderson

Total Files Size (in bytes):	474100

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

<u>New Applications Under 35 U.S.C. 111</u>
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

<u>National Stage of an International Application under 35 U.S.C. 371</u>
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

<u>New International Application Filed with the USPTO as a Receiving Office</u>
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

TERMINAL DISCLAIMER TO OBVIATE A PROVISIONAL DOUBLE PATENTING REJECTION OVER A PENDING "REFERENCE" APPLICATION

Docket Number (Optional): IPW2-USAP191629

In re Application of: Nicholas William Anderson

Application No.: 10/917,968

Filed: August 12, 2014

For: POWER CONTROL IN A WIRELESS COMMUNICATION SYSTEM

The owner*, Intellectual Ventures Holding 81 LLC, of 100 percent interest in the instant application hereby disclaims, except as provided below, the terminal part of the statutory term of any patent granted on the instant application which would extend beyond the expiration date of the full statutory term of any patent granted on pending **reference** Application Number 13726976 & 13727153, filed 12/26/12 & 12/26/12, as the term of any patent granted on said **reference** application may be shortened by any terminal disclaimer filed prior to the grant of any patent on the pending **reference** application. The owner hereby agrees that any patent so granted on the instant application shall be enforceable only for and during such period that it and any patent granted on the **reference** application are commonly owned. This agreement runs with any patent granted on the instant application and is binding upon the grantee, its successors or assigns.

In making the above disclaimer, the owner does not disclaim the terminal part of any patent granted on the instant application that would extend to the expiration date of the full statutory term of any patent granted on said **reference** application, "as the term of any patent granted on said **reference** application may be shortened by any terminal disclaimer filed prior to the grant of any patent on the pending **reference** application," in the event that: any such patent: granted on the pending **reference** application: expires for failure to pay a maintenance fee, is held unenforceable, is found invalid by a court of competent jurisdiction, is statutorily disclaimed in whole or terminally disclaimed under 37 CFR 1.321, has all claims canceled by a reexamination certificate, is reissued, or is in any manner terminated prior to the expiration of its full statutory term as shortened by any terminal disclaimer filed prior to its grant.

Check either box 1 or 2 below, if appropriate.

1. ☐ For submissions on behalf of a business/organization (e.g., corporation, partnership, university, government agency, etc.), the undersigned is empowered to act on behalf of the business/organization.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

2. ☑ The undersigned is an attorney or agent of record. Reg. No. 56,787

/Harry Vartanian/
Signature

September 18, 2014
Date

Harry Vartanian
Typed or printed name

215-568-6400
Telephone Number

☑ Terminal disclaimer fee under 37 CFR 1.20(d) is included.

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

*Statement under 37 CFR 3.73(b) is required if terminal disclaimer is signed by the assignee (owner). Form PTO/SB/96 may be used for making this statement. See MPEP § 324.

Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

CERTIFICATION STATEMENT

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

☐ That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

OR

☐ That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

☐ See attached certification statement.

☒ The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

☒ A certification statement is not submitted herewith.

SIGNATURE

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these record s.

2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.

3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.

4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).

5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.

6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).

7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.

8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.

9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

TITLE OF INVENTION: Power control in a wireless communication system

APPLN. TYPE	ENTITY STATUS	ISSUE FEE DUE	PUBLICATION FEE DUE	PREV. PAID ISSUE FEE	TOTAL FEE(S) DUE	DATE DUE
nonprovisional	UNDISCOUNTED	$960	$0	$0	$960	12/26/2014

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. THIS STATUTORY PERIOD CANNOT BE EXTENDED. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the ENTITY STATUS shown above. If the ENTITY STATUS is shown as SMALL or MICRO, verify whether entitlement to that entity status still applies.

If the ENTITY STATUS is the same as shown above, pay the TOTAL FEE(S) DUE shown above.

If the ENTITY STATUS is changed from that shown above, on PART B - FEE(S) TRANSMITTAL, complete section number 5 titled "Change in Entity Status (from status indicated above)".

For purposes of this notice, small entity fees are 1/2 the amount of undiscounted fees, and micro entity fees are 1/2 the amount of small entity fees.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

PART B - FEE(S) TRANSMITTAL

Complete and send this form, together with applicable fee(s), to: Mail **Mail Stop ISSUE FEE**
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450
or Fax (571)-273-2885

INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

3624 7590 09/26/2014

VOLPE AND KOENIG, P.C.
UNITED PLAZA
30 SOUTH 17TH STREET
PHILADELPHIA, PA 19103

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Certificate of Mailing or Transmission

I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Mail Stop ISSUE FEE address above, or being facsimile transmitted to the USPTO (571) 273-2885, on the date indicated below.

1. Change of correspondence address or indication of "Fee Address" (37 CFR 1.363).
   - ☐ Change of correspondence address (or Change of Correspondence Address form PTO/SB/122) attached.
   - ☐ "Fee Address" indication (or "Fee Address" Indication form PTO/SB/47; Rev 03-02 or more recent) attached. **Use of a Customer Number is required.**

2. For printing on the patent front page, list
   (1) The names of up to 3 registered patent attorneys or agents OR, alternatively,
   (2) The name of a single firm (having as a member a registered attorney or agent) and the names of up to 2 registered patent attorneys or agents. If no name is listed, no name will be printed.
   1 ____________
   2 ____________
   3 ____________

3. ASSIGNEE NAME AND RESIDENCE DATA TO BE PRINTED ON THE PATENT (print or type)

PLEASE NOTE: Unless an assignee is identified below, no assignee data will appear on the patent. If an assignee is identified below, the document has been filed for recordation as set forth in 37 CFR 3.11. Completion of this form is NOT a substitute for filing an assignment.

(A) NAME OF ASSIGNEE (B) RESIDENCE: (CITY and STATE OR COUNTRY)

Please check the appropriate assignee category or categories (will not be printed on the patent) : ☐ Individual ☐ Corporation or other private group entity ☐ Government

4a. The following fee(s) are submitted:
- ☐ Issue Fee
- ☐ Publication Fee (No small entity discount permitted)
- ☐ Advance Order - # of Copies ____________

4b. Payment of Fee(s): **(Please first reapply any previously paid issue fee shown above)**
- ☐ A check is enclosed.
- ☐ Payment by credit card. Form PTO-2038 is attached.
- ☐ The Director is hereby authorized to charge the required fee(s), any deficiency, or credits any overpayment, to Deposit Account Number ____________ (enclose an extra copy of this form).

5. **Change in Entity Status** (from status indicated above)
- ☐ Applicant certifying micro entity status. See 37 CFR 1.29 — NOTE: Absent a valid certification of Micro Entity Status (see forms PTO/SB/15A and 15B), issue fee payment in the micro entity amount will not be accepted at the risk of application abandonment.
- ☐ Applicant asserting small entity status. See 37 CFR 1.27 — NOTE: If the application was previously under micro entity status, checking this box will be taken to be a notification of loss of entitlement to micro entity status.
- ☐ Applicant changing to regular undiscounted fee status. — NOTE: Checking this box will be taken to be a notification of loss of entitlement to small or micro entity status, as applicable.

NOTE: This form must be signed in accordance with 37 CFR 1.31 and 1.33. See 37 CFR 1.4 for signature requirements and certifications.

DATE MAILED: 09/26/2014

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)
(Applications filed on or after May 29, 2000)

The Office has discontinued providing a Patent Term Adjustment (PTA) calculation with the Notice of Allowance.

Section 1(h)(2) of the AIA Technical Corrections Act amended 35 U.S.C. 154(b)(3)(B)(i) to eliminate the requirement that the Office provide a patent term adjustment determination with the notice of allowance. See Revisions to Patent Term Adjustment, 78 Fed. Reg. 19416, 19417 (Apr. 1, 2013). Therefore, the Office is no longer providing an initial patent term adjustment determination with the notice of allowance. The Office will continue to provide a patent term adjustment determination with the Issue Notification Letter that is mailed to applicant approximately three weeks prior to the issue date of the patent, and will include the patent term adjustment on the patent. Any request for reconsideration of the patent term adjustment determination (or reinstatement of patent term adjustment) should follow the process outlined in 37 CFR 1.705.

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

OMB Clearance and PRA Burden Statement for PTOL-85 Part B

The Paperwork Reduction Act (PRA) of 1995 requires Federal agencies to obtain Office of Management and Budget approval before requesting most types of information from the public. When OMB approves an agency request to collect information from the public, OMB (i) provides a valid OMB Control Number and expiration date for the agency to display on the instrument that will be used to collect the information and (ii) requires the agency to inform the public about the OMB Control Number's legal significance in accordance with 5 CFR 1320.5(b).

The information collected by PTOL-85 Part B is required by 37 CFR 1.311. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, Virginia 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, Virginia 22313-1450. Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

Notice of Allowability	Application No. 10/917,968	Applicant(s) ANDERSON, NICHOLAS WILLIAM	
	Examiner DOMINIC E. REGO	Art Unit 2647	AIA (First Inventor to File) Status No

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address--

All claims being allowable, PROSECUTION ON THE MERITS IS (OR REMAINS) CLOSED in this application. If not included herewith (or previously mailed), a Notice of Allowance (PTOL-85) or other appropriate communication will be mailed in due course. **THIS NOTICE OF ALLOWABILITY IS NOT A GRANT OF PATENT RIGHTS.** This application is subject to withdrawal from issue at the initiative of the Office or upon petition by the applicant. See 37 CFR 1.313 and MPEP 1308.

1. ☒ This communication is responsive to *09/18/2014*.
   ☐ A declaration(s)/affidavit(s) under **37 CFR 1.130(b)** was/were filed on______.
2. ☐ An election was made by the applicant in response to a restriction requirement set forth during the interview on _____; the restriction requirement and election have been incorporated into this action.
3. ☒ The allowed claim(s) is/are *51-92*. As a result of the allowed claim(s), you may be eligible to benefit from the **Patent Prosecution Highway** program at a participating intellectual property office for the corresponding application. For more information, please see http://www.uspto.gov/patents/init_events/pph/index.jsp or send an inquiry to PPHfeedback@uspto.gov .
4. ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

   Certified copies:

   a) ☐ All b) ☐ Some *c) ☐ None of the:
   1. ☐ Certified copies of the priority documents have been received.
   2. ☐ Certified copies of the priority documents have been received in Application No. ______ .
   3. ☐ Copies of the certified copies of the priority documents have been received in this national stage application from the International Bureau (PCT Rule 17.2(a)).

   * Certified copies not received: _____.

Applicant has THREE MONTHS FROM THE "MAILING DATE" of this communication to file a reply complying with the requirements noted below. Failure to timely comply will result in ABANDONMENT of this application.
THIS THREE-MONTH PERIOD IS NOT EXTENDABLE.

5. ☐ CORRECTED DRAWINGS (as "replacement sheets") must be submitted.
   ☐ including changes required by the attached Examiner's Amendment / Comment or in the Office action of Paper No./Mail Date _____.

   Identifying indicia such as the application number (see 37 CFR 1.84(c)) should be written on the drawings in the front (not the back) of each sheet. Replacement sheet(s) should be labeled as such in the header according to 37 CFR 1.121(d).
6. ☐ DEPOSIT OF and/or INFORMATION about the deposit of BIOLOGICAL MATERIAL must be submitted. Note the attached Examiner's comment regarding REQUIREMENT FOR THE DEPOSIT OF BIOLOGICAL MATERIAL.

Attachment(s)

1. ☐ Notice of References Cited (PTO-892)
2. ☒ Information Disclosure Statements (PTO/SB/08), Paper No./Mail Date _____
3. ☐ Examiner's Comment Regarding Requirement for Deposit of Biological Material
4. ☐ Interview Summary (PTO-413), Paper No./Mail Date _____ .
5. ☐ Examiner's Amendment/Comment
6. ☒ Examiner's Statement of Reasons for Allowance
7. ☐ Other _____.

1. The present application is being examined under the pre-AIA first to invent provisions.

DETAILED ACTION

Allowable Subject Matter

2. Claims 51-92 are allowed.

3. The following is an examiner's statement of reasons for allowance:

Regarding claims 51, 58, 65, 72, 79, and 86, the prior art of record, specifically Zeira et al. (International Publication Number #WO 2000/57574) teaches a method performed by user equipment (UE), the method comprising:

receiving, by the UE, an indication of whether accumulation of transmit power control (TPC) commands is enabled (Page 4, line 17-Page 5, line 8);

determining, by the UE, a path loss of a downlink channel *(Page 4, line 18-Page 5, line 8, Zeira teaches the first station (base station) transmits power commands based on in part a reception quality of the received communications. The first station (base station) transmits a second communication (remote terminal) having a transmission power level in a first time slot. The second station receives the second communication and the power commands. A power level of the second communication as received is measured (calculated). A path loss estimate is determined based on in part the measured received second communication power level and the first communication power level)*).

However, as a whole, none of the prior art cited alone or in combination provides the motivation to teach receiving, on a single physical channel by the UE if accumulation is enabled, an allocation of a scheduled uplink resource and a TPC command, wherein the TPC command is accumulated with other received TPC commands;

calculating, by the UE if accumulation is enabled, transmit power in association with an uplink communication based on both the path loss and the accumulated TPC commands; and

receiving, on the single physical channel by the UE if accumulation is not enabled, an allocation of a scheduled uplink resource to transmit data at a power level calculated by the UE based on the path loss.

Dependent claims 52-57, 59-64, 66-71, 73-78, 80-85, and 87-92 are allowed for the same reason.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DOMINIC E. REGO whose telephone number is (571)272-8132. The examiner can normally be reached on Monday-Friday, 9:00 am-5:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nay A. Maung can be reached on 571-272-7882. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

*EXAMINER: Initial if reference considered, whether or not citation is in conformance with MPEP 609. Draw line through a citation if not in conformance and not considered. Include copy of this form with next communication to applicant.

[1] See Kind Codes of USPTO Patent Documents at www.USPTO.GOV or MPEP 901.04. [2] Enter office that issued the document, by the two-letter code (WIPO Standard ST.3). [3] For Japanese patent documents, the indication of the year of the reign of the Emperor must precede the serial number of the patent document. [4] Kind of document by the appropriate symbols as indicated on the document under WIPO Standard ST.16 if possible. [5] Applicant is to place a check mark here if English language translation is attached.

ALL REFERENCES CONSIDERED EXCEPT WHERE LINED THROUGH. /D.R./

PART B - FEE(S) TRANSMITTAL

Complete and send this form, together with applicable fee(s), to: Mail **Mail Stop ISSUE FEE**
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450
or Fax (571)-273-2885

INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

3624 7590 09/26/2014

VOLPE AND KOENIG, P.C.
UNITED PLAZA
30 SOUTH 17TH STREET
PHILADELPHIA, PA 19103

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Certificate of Mailing or Transmission

I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Mail Stop ISSUE FEE address above, or being facsimile transmitted to the USPTO (571) 273-2885, on the date indicated below.

REGO, DOMINIC E	2647	455-522000

1. Change of correspondence address or indication of "Fee Address" (37 CFR 1.363).

- ☐ Change of correspondence address (or Change of Correspondence Address form PTO/SB/122) attached.
- ☐ "Fee Address" indication (or "Fee Address" Indication form PTO/SB/47; Rev 03-02 or more recent) attached. **Use of a Customer Number is required.**

2. For printing on the patent front page, list

(1) The names of up to 3 registered patent attorneys or agents OR, alternatively,

(2) The name of a single firm (having as a member a registered attorney or agent) and the names of up to 2 registered patent attorneys or agents. If no name is listed, no name will be printed.

1 Volpe and Koenig, P.C.
2 ____
3 ____

3. ASSIGNEE NAME AND RESIDENCE DATA TO BE PRINTED ON THE PATENT (print or type)

PLEASE NOTE: Unless an assignee is identified below, no assignee data will appear on the patent. If an assignee is identified below, the document has been filed for recordation as set forth in 37 CFR 3.11. Completion of this form is NOT a substitute for filing an assignment.

(A) NAME OF ASSIGNEE: Intellectual Ventures Holding 81 LLC

(B) RESIDENCE: (CITY and STATE OR COUNTRY): Las Vegas, Nevada

Please check the appropriate assignee category or categories (will not be printed on the patent) : ☐ Individual ☒ Corporation or other private group entity ☐ Government

4a. The following fee(s) are submitted:

- ☒ Issue Fee
- ☐ Publication Fee (No small entity discount permitted)
- ☐ Advance Order - # of Copies ____

4b. Payment of Fee(s): **(Please first reapply any previously paid issue fee shown above)**

- ☐ A check is enclosed.
- ☒ Payment by credit card. Form PTO-2038 is attached.
- ☒ The Director is hereby authorized to charge the required fee(s), any deficiency, or credits any overpayment, to Deposit Account Number 22-0493 (enclose an extra copy of this form).

5. **Change in Entity Status** (from status indicated above)

- ☐ Applicant certifying micro entity status. See 37 CFR 1.29
- ☐ Applicant asserting small entity status. See 37 CFR 1.27
- ☐ Applicant changing to regular undiscounted fee status.

NOTE: Absent a valid certification of Micro Entity Status (see forms PTO/SB/15A and 15B), issue fee payment in the micro entity amount will not be accepted at the risk of application abandonment.

NOTE: If the application was previously under micro entity status, checking this box will be taken to be a notification of loss of entitlement to micro entity status.

NOTE: Checking this box will be taken to be a notification of loss of entitlement to small or micro entity status, as applicable.

NOTE: This form must be signed in accordance with 37 CFR 1.31 and 1.33. See 37 CFR 1.4 for signature requirements and certifications.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111
If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371
If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office
If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

ISSUE NOTIFICATION

The projected patent number and issue date are specified above.

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)
(application filed on or after May 29, 2000)

The Patent Term Adjustment is 891 day(s). Any patent to issue from the above-identified application will include an indication of the adjustment on the front page.

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Application Assistance Unit (AAU) of the Office of Data Management (ODM) at (571)-272-4200.

APPLICANT(s) (Please see PAIR WEB site http://pair.uspto.gov for additional applicants):
