- 1 take a server farm for a search engine company, we
- 2 can think of some names, and that server farm would
- choose the high frequency, high performance medium
- 4 power consumption option because they want the
- fastest searches that are possible and they'll have
- 6 more complicated packages.
- 7 The low power option will have lower
- 8 clock speeds, lower performance, but would be more
- <sup>9</sup> appropriate for a battery power device.
- 10 And the fundamental difference, for
- example, would be in the threshold voltages of the
- transistors. So for the server one you'd have
- lower threshold voltages with higher leakage but
- $^{14}$  higher performance. In the low power chips you'd
- have slightly higher threshold voltages but much
- lower leakage and that would be to lower overall
- power.
- $^{18}$  Q The '812 patent -- or excuse me -- the de
- 19 Cesare family of patents talks about having
- components in different performance domains; is
- that correct?
- 22 A Yes, it talks about different performance
- domains.
- Q Is it fair to describe that as having
- different portions of the chips that are subdivided

- for performance purposes?
- 2 A For performance purposes you would take
- 3 the overall chip and define power domains in
- 4 portions of the chip.
- <sup>5</sup> Q Was that known to persons of skill in the
- art before the de Cesare family? In other words,
- you didn't have to run every
- 8 part of the chip at the same performance level
- 9 before the de Cesare family?
- 10 A Prior to the de Cesare patent the idea of
- having different parts of the chip with different
- 12 clock voltage frequencies, different performance
- 13 characteristics was known.
- Q Was there also before the de Cesare
- $^{15}$  family hardware and/or software that could be used
- to transition the performance states of different
- performance domains?
- 18 A Yes, there was hardware and software to
- design microchips and have different performance
- domains with different levels.
- Q Can you think of any specific examples
- prior to the de Cesare family of that being the
- case, having hardware and/or software that changes
- the performance states of different components on a
- 25 system on a chip?

- 1 A So you're asking can I think of examples
- of hardware and software designs that controlled
- 3 performance domains.
- MR. GREEN: Object to the form.
- 5 A So, for example, one that I looked at in
- 6 the 2000s was the Intel StrongARM processor and
- <sup>7</sup> there were ways to have the memory go faster or
- 8 slower, have different frequencies and voltages for
- <sup>9</sup> the memory versus the processor.
- 10 BY MR. DAVIS:
- 11 Q In the Intel StrongARM design, what was
- it that caused the memory to go faster or slower
- based upon the processor performance?
- 14 A In the Intel StrongARM processors the
- software would decide to move either the processor
- itself or the memory system to a different
- 17 frequency and voltage.
- 18 That decision would be implemented by --
- well, the software would make the decision, would
- send information down and eventually you'd have
- hardware gates that would actually, for example,
- connect a new voltage to the power line or connect
- 23 a different frequency to the memory or to the
- processor.
- The broad name of the technology was

- 1 called dynamic frequency and voltage scaling.
- Q When you say software would cause it, is
- 3 this operating system software or what exactly do
- 4 you mean by the software?
- 5 A The software that would control the power
- 6 could be the operating system or in the case of an
- of the state of
- 8 system you could have application software specific
- 9 to that embedded system making -- making the
- decision.
- MR. GREEN: Is it okay if we take a
- break? I need to run to the restroom and I've lost
- my real-time feed.
- MR. DAVIS: Oh, yeah, yeah, that's fine,
- $^{15}$  we can take a break.
- MR. GREEN: Thank you.
- VIDEO TECHNICIAN: The time is 10:12 a.m.
- We're now off the record.
- 19 (Recess taken.)
- VIDEO TECHNICIAN: The time is 10:19 a.m.
- We're back on the record.
- 22 BY MR. DAVIS:
- Q Welcome back, Dr. Mooney.
- A Thank you.
- Q If you could look at Mooney Exhibit 3

# DOCKET

# Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

# **Real-Time Litigation Alerts**

Keep your litigation team up-to-date with **real-time** alerts and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

## **Advanced Docket Research**

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

## **Analytics At Your Fingertips**

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

### API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

#### **LAW FIRMS**

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

#### **FINANCIAL INSTITUTIONS**

Litigation and bankruptcy checks for companies and debtors.

### **E-DISCOVERY AND LEGAL VENDORS**

Sync your system to PACER to automate legal marketing.
