

DECLARATION OF COMPETENCY

Translation from French (France) to English (United States)
MultiLing Project Number: RENO01820002HQ-C
Client: Apple

My name is Anne Mouyart-Krebs and I declare that:

- I am fluent in both English and French and have professionally translated documents from French to English and vice-versa for 9 years, including 1 years for MultiLing Corporation;
- I translated the original document, EP 1 009 153 A1, which is attached hereto as Exhibit B, from French to English, and the translation is attached hereto as Exhibit A;
- Exhibit A is a true and accurate, publication-quality translation of Exhibit B; and

Pursuant to 28 U.S.C. § 1746 and subject to 18 U.S.C. § 1001, I declare under penalty of perjury under the laws of the United States of America that the foregoing is true and correct and that I believe the foregoing is true based upon my personal knowledge and information.

Signed this 7th day of February, 2019.

M Krebs

Anne Mouyart-Krebs

ACKNOWLEDGMENT BEFORE NOTARY

State of Utah

}ss.

County of Utah

On this 7th day of February, 2019 before me, the undersigned Notary Public, personally appeared Anne Mouyart-Krebs, who proved on the basis of satisfactory evidence to be the person whose name is subscribed to this Translator’s Certificate of Translation and who acknowledged that he or she executed the same for the purposes stated therein.

IN WITNESS WHEREOF, I hereunto set my hand and official seal.

Dixie Calkins

Notary Public, residing at Lehi, Utah

(54) Method for Establishing Communication Between Two Elements Connected to an Internet-Type Computer Network

(57) The method is used to establish communication through an Internet-type computer network (3) between two Internet information transmission elements, calling (1) and called (2), with direct call addresses for accessing signaling channels between elements (1, 2) and able to access the computer network (3) by

respective computer addresses, one of the two information transmission elements (1, 2) having called the other (2, 1) by a signaling channel by sending it the computer address thereof, it is in turn called by said other element (2, 1), but via the computer network (3) at the transmitted computer address.

METHOD FOR ESTABLISHING COMMUNICATION BETWEEN TWO ELEMENTS CONNECTED TO AN INTERNET TYPE COMPUTER NETWORK

Description

[0001] The present invention relates to communications over Internet type information networks for data transmission and more specifically communications in telephonic mode for voice and data transmission.

[0002] Through the Internet, PC type terminals can access data servers continuously connected to the Internet and to which a permanent IP address was assigned.

[0003] PCs, since they are never called, do not need a permanent IP address. To call a server, the PC user first calls their Internet access service provider by the switched telephone network and their provider supplies a temporary IP address valid solely for communication which is going to be established with the server. The server can thus in return send the requested data.

[0004] Such an operation avoids wasting addresses. However, it is not suited for communication to simple terminal elements such as PCs, telephone stations, fax machines or others without permanent IP address. The calling party in fact cannot warn the called party of their call so that the called party can connect on the Internet.

[0005] The present invention aims to establish communication, through an Internet type computer network for data transmission, from a calling information transmission element with an homologous called element without permanent address on this network.

[0006] For that purpose, the invention relates to a method for establishing communication through an Internet type computer network with two Internet information transmission elements, calling and called, with call addresses for accessing signaling channels between the elements and able to access the computer network by respective computer addresses, the method characterized by the fact that:

One of the two information transmission elements, calling and called, having called the other by a signaling channel by sending it the computer address thereof, it is in turn called by said other elements, but via the computer network at the transmitted computer addresses.

[0007] In that way, the computer network and the signaling channels are functionally integrated for forming a telephone type network, meaning all elements thereof can be reached directly. Establishing communication by computer network just requires the prior use of signaling channels without involving establishment of communication strictly speaking, while a possible tax will only represent a limited cost.

[0008] It is thus possible to manage without any appointment server and any prior agreement as to a meeting time, because the communications are established in real time.

[0009] In the case where the two elements belong to a single information transmission network, the call to one by the other and also the communication through the computer network can be done through the single network.

[0010] Thus, the complexity of the elements and the subscription costs are limited.

[0011] If the elements belong to at least two information transmission networks, the call to one by the other is done through one of the transmission networks and the communication through computer network can be done through the same transmission network or else through another of the transmission networks.

[0012] In this latter case, signaling channels available in one of the networks, like the GSM network, can be used and communication established through the other network, if it offers a lower communication cost or higher throughput or transmission quality, for example the switched telephone network or the ISDN network.

[0013] The invention will be better understood with the help of the following description of a preferred embodiment of the method of the invention with reference to the attached drawings in which:

- Figure 1 schematically shows two telephone stations from the GSM cellular radiotelephone network connected to the Internet; and
- Figure 2, formed by Figures 2A and 2B, is a flow diagram showing the steps of the method.

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
