## I. Introduction

Petitioner Unified Patents Inc. (“Petitioner” or “Unified”) respectfully requests *inter partes* review (“IPR”) of Claims 1-4, 6-8, 14, 16, 18-21 (collectively, the “Challenged Claims”) of U.S. Patent 8,135,073 (“the ’073 Patent,” Ex. 1001).

The ’073 Patent describes systems and methods for decoding video data that includes determining a re-mapping strategy for video enhancement of a first video frame and re-using the same re-mapping strategy to enhance a second frame within the same video stream. This method of re-using a re-mapping strategy was known long before the ’073 Patent, as shown by both *Yang* (Ex. 1004) and *Paik* (Ex. 1005), as discussed in more detail below. The Challenged Claims are therefore obvious over the prior art and should be found unpatentable.

## II. Summary of the Patent

### A. Technology Background

Digital video is formed from a sequence of individual video frames that include pixel data. *See Freedman Decl.* (Ex. 1003) at ¶ 34 (citing *Richardson* (Ex. 1009) at 36-38). Each frame is an array of pixels organized in rows and columns to form the image represented by the frame, where the pixels reflect characteristics of objects represented in a scene of a video. *Richardson* (Ex. 1009) at 36-38. These rows and columns of pixels are generally divided into small regions called “blocks” of data. *Id.* As shown below, each frame is a table or matrix of pixels, i.e., pixels in

rows and columns form an image represented by the frame. *Richardson* (Ex. 1009) at 10-11, 17-19. The pixel data reflects characteristics of objects represented in a scene of the video, such as shapes and edges. *Id.* at 10, 33; *see also Freedman Decl.* (Ex. 1003) at ¶ 34.

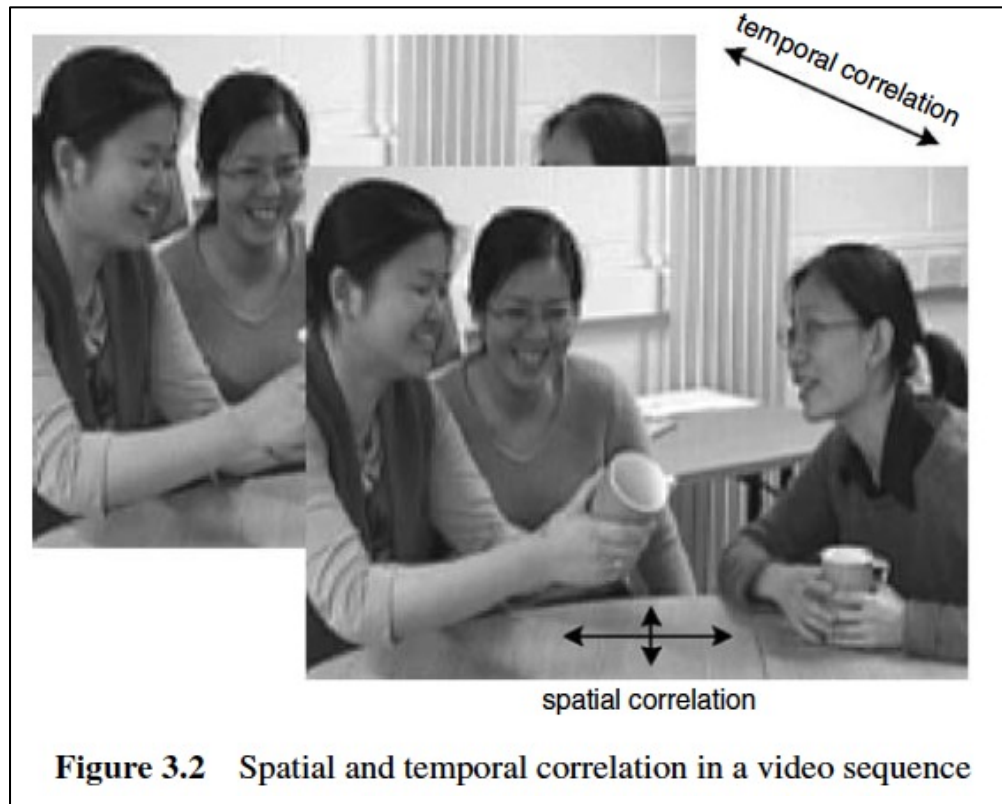

**Figure 2.2** Spatial and temporal sampling of a video sequence

*Richardson* (Ex. 1009) at Fig. 2.2.

Digital video files can be large due to the large amounts of image data associated with each frame. *Id.* at 2-5. To efficiently transmit them to end-user devices for quick playback, video coding techniques are used to compress (i.e. encode) video files for efficient transmission and later receipt and decompression (i.e., decoding), followed by output at an end-user display device. *Id.* Such compression is achieved, in part, by removing redundancy in and between frames. *Id.* at ¶ 35. Specifically, within a particular sequence of video images, individual

frames can be correlated to benefit from redundant video information from within a given frame (spatial correlation) and from successive frames captured at around the same time (temporal correlation):

*Richardson* (Ex. 1009) at 53, Fig. 3.2.

Many aspects of video coding were well-known long before the '073 Patent, including region-based video coding that use prediction techniques to remove spatial and temporal redundancy in coded video data. See '073 Patent (Ex. 1001) at 2:20-33. As acknowledged in the '073 Patent (and illustrated in Fig. 3.2 above), it was a well-known aspect of the Moving Picture Experts Group or "MPEG-2" standard (adopted in 1996) to encode video frames using spatial prediction within a single

# Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

## Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

## Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

## Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

## API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

## LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

## FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

## E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
